I do not think a complete test of any boiler could possibly be made in less than one week—that is, the boiler would be worked at constant powers for each particular day, the power being decreased on successive days. Observations would be kept throughout each day. Now a heating engineer who was provided with tests of a boiler such as these would know exactly where he was. He could tell at once whether his boiler would do the work expected of it, and if having installed the boiler, he found it was not up to the work expected of it, he could tell with certainty whether the deficiency was due to poor circulation, bad fuel, poor draught, bad attention, or defective power in his boiler. His draught gauge would indicate whether the chimney pull was sufficient, or whether the fuel was inferior. He could measure the weight of fuel consumed during a day and compare it with the test result, and know at what point he was getting the maximum efficiency out of his boiler. Such tests would be of the greatest possible assistance to the maker, affording him an absolute indication as to improvements in design, and would give a great fillip to the art of boiler design, and would doubtless result in the evolution of a standard type of boiler and the elimination of the unfit. The thermal efficiency of the boiler is, of course, not the only consideration, and boilers of inferior thermal efficiency might, and doubtless would, hold their own in the market on the ground of superior convenience, strength, or other qualities not directly connected with the thermal efficiency.

For catalogue purposes it would be very difficult indeed to indicate the results of these tests without considerable elaboration, and I am not sure whether it could with advantage be done in an ordinary commercial catalogue.

Conditions for Uniformity of Result.—In order that the tests may be strictly comparable with one another, it would be necessary that they should all be obtained with constant conditions. The conditions that affect the result are the temperature and velocity of the water circulating in the boiler, and the quality of the fuel used. All these remarks refer to water boilers. I am strongly of the opinion that a test of a water boiler made by measuring the amount of steam it can generate is wholly unsatisfactory, because such a test does not and cannot give the same result as would be obtained with a water circulation. The circulation through the boiler should be at approximately the same velocity as obtains in practice and the temperatures of the water should be similar. These conditions can only be secured by a natural circulation, in which the difference in temperature between the flow and return pipes is artificially kept constant. In testing the same boiler at different powers, regulation of power should be obtained by maintaining at a constant rate the flow of water through the boiler, and varying the temperature of delivery by controlling the combustion, but for any one day's test the temperature should be kept the same throughout the whole of the run. The temperature difference between flow and return should be less as the flow temperature decreases, in accordance with the principle that radiators lose more heat at a higher temperature.

The character of the fuel employed—preferably coke—must be similar to what is employed in actual practice, neither exceptionally good nor exceptionally bad, and a large quantity of it should be accumulated so that the quality may be as uniform as possible throughout a large number of tests. A large number of samples of it should be tested with a calorimeter.

The boiler itself should be installed so as to be under the same conditions as in practice, and the conditions must be such as to enable the heat given off to be measured within, say, 5%. I have not the least doubt that the tests, if carefully made, would be capable of being reproduced, so that one could not obtain two different results when the conditions were the same.

Mr. James Miller, A.R.S.A., architect, Glasgow, has been instructed by the directors of the City and County of Perth Royal Infirmary to prepare plans and specifications for the erection of the new Infirmary at Western Avenue, Tullylumb, Glasgow Road. The infirmary is to contain 120 beds, and the estimated cost is 36,800*l*.

OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* has a chatty account of an architect's "little journey in the Oise Valley," with some sketches that are notable rather for the catholicity of taste of the tourist than for excellence.

La Construction Moderne continues its description of old Paris, with sketches from the Rue Brisemiche, including the apse of the church of Saint-Merry or Médéric. Illustrations are given of the chapel of the Ecole des Roches, in Normandy, the salient feature of which is the construction of the roof with laminated ribs, without ties, M. Storez being the architect.

Architekten und Baumeister Zeitung illustrates with plans and view a characteristic Viennese block of residential flats in the Widerhofergasse, of which Rudolf Erdös is the architect.

Deutsche Bauzeitung continues the account of Frankish architecture by Professor F. Ehemann, dealing with the Renaissance work of 1539-1650, and accompanied by illustrations of the Royal Schloss at Würzburg, the Kloster Ebrach, the Schloss Pommersfelden and the Schloss von Werneck. A description, with illustrations, is also given of the Prussian Legation at Munich, with which is combined the gallery containing the collection of modern pictures made by Adolf Friedrich, Graf von Schack.

Moderne Bauformen is chiefly occupied with an extensive and varied series of domestic work, including examples from Copenhagen and from many different parts of Germany. There are some pleasing coloured sketches of interior treatment.

Der Profanbau has some excellent illustrations of the new Charlottenburg Bridge at Berlin, a very fine piece of work designed by Professor Schaede. An interesting study is a combined infants' school and housewifery school at Bielschowitz. An illustrated article by Friedrich Müller traces the development of smithcraft from the eleventh and twelfth centuries to the latest "new art" mode as exemplified in the Berlin underground railway.

Employment Register.

Sir,—Some time ago an Employment Register was instituted by this Society for the use of professional engineers seeking employment, and in view of the utility of such an organisation it is hoped that you will render any assistance in your power in giving publicity to the particulars stated below. Where a vacancy is advertised the employer is immediately inundated with hundreds of applications, the examination of which involves considerable extra work and loss of time (to say nothing of temper), but the use of this Register goes far to solve the difficulty of selection from among a large number of applicants personally unknown to the advertiser.

The principal features of the Register are as follows:—

1. No fees of any kind are charged, the cost of management being defrayed by the Society with a view to the ultimate benefit of the profession.

2. Qualified engineers of all grades may have their names recorded, though in making a selection from a number of equally suitable men, preference is naturally given to members of the Society, for whom the register was originally instituted.

3. Only a few names of probably suitable candidates are put forward for each vacancy so as to facilitate the employer's choice as much as possible.

4. Every effort is made to get personal knowledge of candidates, together with full details of their qualifications, before sending in their names.

A number of well-qualified men, representing the various branches of engineering work, are now available, and it is thought that if the register were better known it would be widely used and appreciated by all who require draughtsmen, inspectors, and other classes of assistants.

Employers are invited to send inquiries by telephone or in writing to the Secretary, stating their requirements as regards age, qualifications, salary, &c.

A. S. E. Ackermann.

Society of Engineers, 17 Victoria Street, Westminster, S.W.: October 18, 1909.

FORTHCOMING EVENTS.

Monday, November 1.

Royal Institute of British Architects: President's Opening Address. Presentation of the Royal Gold Medal to Dr. Arthur Evans, F.R.S. Address by Dr. Evans on "Recent Discoveries in Crete."

Liverpool Architectural Society: Paper on "The Elements of Design in Internal Decoration," by Mr. T. R. Spence.

Tuesday, November 2.

Institution of Civil Engineers. Address by the President, Mr. James C. Inglis. Presentation of Council's awards and reception.

Wednesday, November 3.

Royal Archæological Institute: General Meeting.

Institute of Sanitary Engineers: Paper on "Oriental Sanitary Engineering," by Mr. C. T. Evennette.

Thursday, November 4.

Paint and Varnish Society: Paper on "Painting on Stucco," by Mr. Furniss.

Friday, November 5.

Architectural Association: A paper on "Drainage and Sewage Disposal," by Mr. W. D. Scott-Moncrieff.

SELBY ABBEY.

THE magnificent abbey church of Selby, which was re-opened on Tuesday in last week, after the restoration necessitated by the great fire in October 1906, three years ago, has an interesting history, as well as an exceptional charm as one of the most beautiful of the great monastic churches of England.

Founded in 1069 by BENEDICT of Auxerre "in honour of Our LORD JESUS CHRIST and of His most blessed Mother the VIRGIN MARY, and of ST. GERMAIN of Auxerre," it was in the time of his successor, HUGH DE LACY, that the foundations of the present building were first laid. Of the work of this abbot, the most powerful, distinguished, and pious of the long roll of those who ruled at Selby, there now remain the western wall of the north transept, a part of the north wall of the same, the lower part of the tower, the fragment of the south transept, the easternmost bay of the nave, and the two turrets flanking the north transept.

It has been suggested, and seems highly probable, that FLAMBARD'S work in the nave of Durham and HUGH'S work at Selby were the design of the same architect. In both there are peculiar and similar details, in both the alternation of circular column and clustered pier, the latter with vaulting shaft, suggesting an intended, but never accomplished, method of vaulting the nave somewhat in the German Romanesque manner, with two bays of the nave arcade comprised in one bay of the main vault.

Between 1140 and 1180, in the Transitional period, were erected the north triforium, the north porch, and the west end of the nave. Of this work the north triforium and the north porch are especially remarkable as among some of the best work of the period that we have in England, and well exemplify the influence of the Cistercians on the development of English Gothic, even though Selby was not of their order, but Benedictine.

The Early English work includes the south triforium, the clerestory of the nave, and the upper part of the west end of the nave, all of which were completed by the year 1221. The gable of the west front, it should be noted, was erected in 1873, from the design of Sir GEORGE GILBERT SCOTT.

It was not till about the year 1280 that the present choir of Selby was begun, and to this fact we owe the manifestation of one of the finest examples we possess of the Decorated period in its full fruition. During this epoch, between 1280 and 1360, there were inserted traceried windows in the aisles of the nave and clerestory windows on the west side of the north transept.

Completing the value of Selby as an historical guide-book to the development of English Gothic architecture, we have as contributions of the Perpendicular period, between 1400 and 1540, the great window in the north transept, the Latham Chapel, the sedilia, the west window, and the arch at the east end of the north aisle of the nave.

Selby, on the dissolution of the monasteries, was finally surrendered to the King in 1539, and in 1618 was made "parochial" by letters patent of JAMES I. Its revenues, diminished as they had been during the latter part of its existence as a monastery, having thus been lost, dilapidations followed, and in March 1690 the upper part of the tower fell, carrying with it the south transept, the vaulting of the adjoining bay of the choir, and a portion of the south choir aisle. The restoration of the south transept still remains to be carried out, and it is to be hoped that the necessary funds may soon be contributed, so that what has been so well and quickly done to efface the dire catastrophe of three years ago may be supplemented by a restoration of Selby Abbey to its complete design.

Although in its best days a Benedictine abbey of high importance and great wealth, the whole of the domestic buildings, together with the cloisters, which were on the south of the nave, have disappeared.

The nave, which suffered less than the rest of the Abbey, was re-opened on October 19, 1907, one year after the fire. It was temporarily fitted for service and has been in full use since that date.

Two years more have been required for the completion of the restoration and for the addition of the upper stage of the central tower. It has now been found possible to raise the tower to the height it had been in the fourteenth century, but, as we have already said, the south transept is still missing, and its absence detracts very much from the beauty of the exterior.

Before the tower was undertaken, very extensive underbuilding was necessary, as the Norman foundations were quite insufficient, and had to be replaced with new ones going down to the solid soil below.

The design of the tower has been based on old drawings, which, however, differ a good deal, so that only an approximation to the ancient design has been possible. The effect is certainly striking, and it harmonises well with the rest of the building, and especially with the choir, the style of which has been followed. The effect of the fire on the eastern part of the Abbey was deplorable. All the roofs were completely destroyed, as well as the stalls, organ, reredos, screens and all other fittings. Nothing remained but the bare stonework, and this was so much injured that unless powerful wooden supports had been erected at once, the beautiful choir must have collapsed. Many months were occupied with the repairs to the stone columns and arches of the choir and south transept. This has all now been accomplished. Great quantities of new stone of a similar kind to the old have been inserted; the mouldings of the arches and other features have all been

Digitized by Google

made good; underpinning has been done where it proved to be necessary, and strength has been supplied where it was wanted. The building has now far more stability than at any previous time, for the original weakness of the Norman foundations, from which the Abbey had always suffered, has been remedied and the various defects which this had led to have been made good. It was in the tower and the transept that the most serious weakness was found, and a great amount of work was necessary. All this has now been done in the most satisfactory way, and the greatest credit is due to the contractor, Mr. Ullathorne, and to Mr. Searle, the clerk of the works.

Turning now to the injury done by the fire to the roofs of the Abbey, it has to be pointed out that the choir has always been ceiled with oak groining of very beautiful design. It would appear that the first intention of the fourteenth-century builders was to cover it with stone groining. Some preparations were made by preparing for flying buttresses in two places, but the idea was abandoned and the design of the groining was carried out in oak.

This beautiful work was entirely destroyed by the fire, but happily it has been possible to reproduce it with great accuracy. The carved bosses were a notable feature, and these have for the most part been reproduced from some excellent photographs which were taken some years ago. The north transept and the adjoining Latham Chapel had finely panelled ceilings dating from the fifteenth century. These were completely destroyed, but it has been possible to recover their designs from drawings which existed. In the tower the panelled ceiling as well as the floors above and the roof were all reduced to ashes, and at the same time the fine peal of bells and the clock perished. All these losses have now been made good, the bells, increased in number from eight to ten, having been hung at a higher level in the new belfry stage.

The roofs of the choir aisles escaped destruction, as was also the case with the nave aisles, these parts of the Abbey having stone groining, which prevented the fire from reaching the woodwork. All the roofs were covered with lead, and this, of course, perished with the timber; but it is satisfactory to note that nearly 1,200*l.* worth of lead was recovered from the *débris*. All the lead covering has now been reinstated, so that the external appearance is almost exactly the same as before the fire, the only exception being that it has been thought best to add a high-pitched roof to the north transept, as indicated by the weathering on the tower. The exterior of this transept was not satisfactory, and it is generally felt that the alteration of the roof and the completion of the gable and its pinnacles has effected a very great improvement in this part of the Abbey. Internally the fine panelled ceiling has been retained.

Turning now to the interior of the Abbey, the destruction caused by the fire was absolutely complete. Hardly the smallest vestige of any of the fine woodwork of the choir remained. The stalls, the elbowed seats of which were in part ancient and of very remarkable design, were entirely destroyed. The whole of the screenwork filling the side arches of the choir perished, no trace of the organ remained, while the reredos, altar, altar rails, pulpit and the celebrated wooden aumbries all shared the same sad fate, and were reduced to heaps of charcoal. Four of the side screens were ancient and of unique design, while the aumbries which occupied the north side of the sanctuary were of the greatest interest, nothing like them existing in any other church.

Happily it has been possible to reproduce all the ancient woodwork with great exactness; various drawings and measurements existed, several of great value having been lent by the kindness of architects. In this way and by the help of photographs the ancient design of the elbowed stalls, the sanctuary screens, and especially of the old aumbries, has been recovered, and their reproduction may be regarded as absolutely correct.

One ancient screen at the west end of the north choir aisle was not altogether destroyed, its western side being to a large extent saved. This has been carefully restored and the missing features supplied from drawings and photographs. The remainder of the choir woodwork only dated from the restoration in 1890, and was designed by Mr. Oldrid Scott. All this has now been replaced, but owing to the liberality of the ladies' committee and others it has been possible in every case to improve on the former design and to make the new fittings as far as may be worthy of this noble building. There have been notable additions to the woodwork, especially a choir screen and the cases of the double organ, which now occupies the western arches of the choir. The choir screen is lofty and very open, and its details are extremely rich and finely carved. This is the work of Mr. Bridgeman, who has also executed the framework of the reredos, the pulpit, the Bishop's chair and the Litany desk.

The stalls, the canopied screens behind them and the organ cases have been made by Messrs. Thompson of Peterborough, while the reproduction of the ancient sanctuary screens, those enclosing the Latham Chapel and the aumbries are the work of Mr. Ullathorne of Selby. All this woodwork is of the highest order of workmanship and reflects the greatest credit on the various firms who have so admirably carried out the architect's designs. The sculpture in the reredos, representing the Crucifixion and other subjects, has been executed in Ober Ammergau, and is a fine example of the work of Herr Peter Rendl, the talented sculptor of that place.

The choir has been paved with marble, the old paving having been too much injured to be retained. This work has been done by Garston Freres, a Belgian firm, one of the partners, Mr. W. Wrathall, being connected with Selby.

The restoration of the ancient stone carving, as well as all the new carving in the tower and elsewhere, has been admirably done by Mr. J. Baker, of Ravensdon Street, Kennington.

The wrought-iron altar rails are the work of Mr. Clarke of Brackley, while the choir gates have been made by Mr. Norkett of Maidenhead. Bells by Taylor of Loughborough, and clock by Smith & Sons of Derby.

A morning chapel has been formed at the east end of the north choir aisle. Here is another screen (making fourteen in all), while the altar is a careful reproduction of a fine old Jacobean table which was destroyed by the fire, and the altar rails are founded on the design of the old Classic ones which formerly belonged to the choir.

The grand old stained glass in the east window was terribly injured by the fire, but it has been admirably restored by Messrs. Ward & Hughes, who had previously in the early 'seventies been employed by Mr. William Liversidge to complete its ancient design.

Such are the works which have been carried out in restoring the grand old Abbey to the condition it was in before the fire. Infinite pains have been taken by the architect and all connected with the work to reproduce faithfully each ancient feature and to make every part of the work worthy of the beautiful Abbey which is the pride not only of Selby but of all Yorkshire.

Our slight sketch of the history of Selby and of the work of its latest restoration are derived from a most interesting brochure* by Mr. Charles H. Moody, excellently illustrated by photographs and by beautiful pen and ink drawings by Mr. E. Ridsdale Tate; and from a description by Mr. J. Oldrid Scott, F.S.A., the architect of the restoration.

Another of the panels in the banqueting-room of the Edinburgh Council Chambers has been filled up by the placing in position of the picture gifted by the High Constables of Edinburgh. It is, like the others, painted by William Hole, R.S.A. The scene is the dinner party at Holyrood prior to the Young Pretender's departure for England. The panel is one of four smaller ones above the doors of the room. The other three are in Mr. Hole's hands—the subject of two of them is Queen Mary.

NOTES AND COMMENTS.

Mr. W. D. Caröe, in the *Church Builder*, runs a tilt against "the most destructive of Nature's aids to the picturesque," "the ivy bough," and counsels its ruthless destruction and imperative removal. He especially emphasises its destructive activity in the neighbourhood of water-pipes. There are differences of opinion as to whether ivy does or does not tend to make a wall damp, but there can be little doubt that it is an active cause of the rapid development of incipient weakness in all walls, whether of stone or brick.

It is rather amusing to read in the report of the meeting of the Court of Common Council of the City of London the various opinions expressed by architect members of the Court on the proposal brought forward by the City Lands Committee to reinstate Dance's front. But nobody seemed to have had the courage to advocate outright the only sensible alternative, to pull down the remainder of Dance's work and put something else in its place. Now that the matter has come up for consideration, it can scarcely be left as Sir Horace Jones left it. Granted that Dance's work is bad Gothic, surely this is no argument for leaving part of it, for keeping the front of the Guildhall of the great City of London in the guise of a pig with one ear. The pig may not be beautiful, but he would certainly look better with his symmetry complete as he first appeared.

We are glad to know that the appeal that has been made for further sums for the repair of Hexham Abbey, and for paying the architect for what he has already done, has met with the response of a donation of one hundred guineas as a start. We are also gratified to learn that Canon Savage, the rector of Hexham, contemplates the establishment of a Fabric Fund for the maintenance in repair of the building when the "restoration" is completed. Our national monuments should never need "restoration," they should be kept in repair by immediate and frequent attention to each and every small defect that arises. It is only the neglect of the custodians of old buildings that renders "restoration" necessary and urgent appeals for funds imperative.

From the Presidential address of Professor Amoyl, Dean of the Faculty of Arts in the University College, Aberystwith, to the members of the Birmingham Welsh Society we learn that there are in Wales no certain traces of the existence of palæolithic man, although there are many of the neolithic inhabitants, and still more of the bronze and early iron age. The bronze age appears to have commenced in Wales about 1500 B.C., and was succeeded by the earlier iron age about 200 or 250 B.C. From the character of the remains of the bronze age Professor Amoyl deduces that Brythonic-speaking tribes of Celts settled in Wales from Gaul about 400 B.C., and were followed by a considerable influx of these tribes towards the first century B.C.

Liverpool proposes to spend 225,500*l.* on an improvement scheme for the Housing of the Working Classes, but estimates that this will only require a rate of ½*d.* in the pound, for which accommodation is to be provided for 2,960 persons. It is assumed that sixty years will be allowed for repayment of the principal expended on the buildings, the estimated net receipts from the rents being estimated at 3,100*l.*, and the charge for interest and instalments of principal for the first year after the money is borrowed being 11,220*l.* From this we gather that Liverpool is rich enough with a ½*d.* rate to make a present of 8,000*l.* to the 2,960 persons who are to be housed in the new buildings. It is interesting to note that the cost of the buildings is estimated at 70*l.* 17*s.* per room, not counting the scullery, which will be provided, or, if this is counted as a room, then the cost is 50*l.* 10*s.* per room. Unfortunately, experience shows that the estimates made before a municipality starts a philanthropic housing scheme do not always or usually tally with the cost that has to be met when the scheme has matured. The tenants having been given something often take a bit more, and do not pay their rent even if they condescend to occupy the homes kindly provided for them out of the rates, which they do not always do.

ARCHITECTURE: ITS TRUE PRINCIPLES.—XXI.

By R. Owen Allsop.

Practical Balancing.

We have considered that that geometric solid that has the greatest cubical contents is dominant in effect over that which has less. The truth of this is more apparent when we consider how the plain geometric formation, such as the large, plain, rectangular mass, is the more effective, the less broken by lines or enrichments. As respects, therefore, mere domination of mass, there is little or nothing to be done to make a small mass hold its own against the larger. We are consequently compelled to look to other means of establishing a balance than by mere weight of solid form.

If we take a composition consisting of two rectangular plain forms, the one cutting the other, and the end of one brought into a gable facing, say, the street—a common arrangement in house-building—such a design on elevation will look "top-heavy," out of balance and very "lop-sided." We have, however, considered the matter of elevation. What we want to find out is—*what is round the corner?* The effect of perspective upsets every draughtsman-balanced composition. Therefore, the subject of balancing in architectural design, when concerning massing, must be considered always in perspective. Now, in the case instanced, perspective affords us a view of the end of the other rectangular mass, and if this is suitably treated the *coup d'œil* may be one of balance. The effect of such a design is in perspective totally different from what it is in elevation. We can see the other gable and the elevational want of symmetry is not apparent.

The moral of this consideration is that all practical balancing must be accomplished not on elevation but by considering the effect of the building all round. If the designer has not the imaginative mind's eye he should make perspective sketches from all points of this composition. Only in this way can the true effect be observed. Great experience and observation of the effect of massing and grouping is required to produce a balanced perspective effect of elevational asymmetry, although, as we have pointed out, practical laws of perspective are all in favour of the asymmetrical design, that is providing it has one prominent axis of symmetry in the plan.

Failing a oneness of motive—as in cruciform structures for religious purposes—we must necessarily fall back upon the artist's method of *providing one dominant feature.* We must take our lessons in balancing and grouping for effect from the artist. He trains his eye to detect the beautiful and interesting. To such, it would seem, bi-symmetry is the one effect of all others that he strives to avoid. In pictorial composition the first principle is the avoidance of the symmetry of halves, or the use only of such effects of this as naturally arise in perspective. The main object of the artist is to create interest in his picture, and to this end he creates an artificial point—the "principal object." If then the architect considers his composition from the view of the artist he will see to it that his design purpose has varied interest and that certain objects have superior value (in point of eye and mental interest) to others, and that one certain point constitutes a true climax. The last thing the picture-maker would dream of doing (if his work included architectural representation) would be to represent anything approaching to the architect's "elevation."

At first thought the reasonableness of this is not apparent. The architect goes to trouble to produce that which has the bipartite symmetry of design. He considers it a beauty—and up to a certain point, condition and circumstance, we are all agreed as to this. But if the effect of bi-symmetrical design is of itself a beauty, why does not the artist endeavour to reproduce this effect in his picture? We see that his aim is entirely contrary. The whole question seems to turn on the point that there is no such thing as visual bipartite solid effect in nature. The only approxi-

Digitized by Google

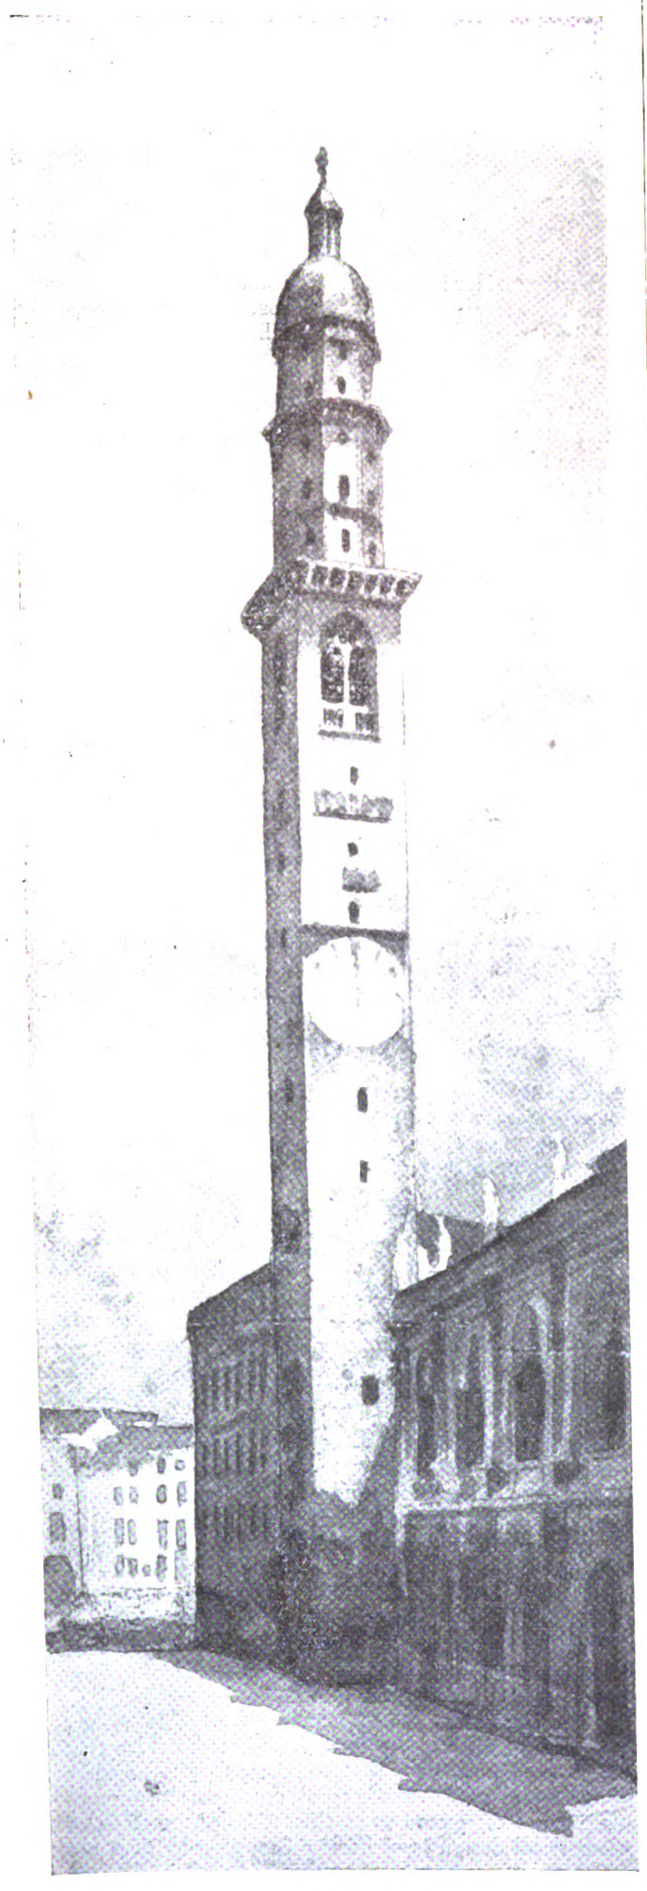

Fig. 43.

mately true effects in this way refer to superficial—plane—designs; as the smallest object of symmetrical design in three dimensions is not seen as such.

Concentration.

Practical balancing then resolves itself into the concentration of thought of the designer, as respects both massing and enrichment by work on surfaces or solids, on certain desirable parts. The eye in this way is attracted to a certain group or mass, or to a more enriched portion. We do not mean more carved enrichment, but more "work," more thought in arranging necessary features. If we have quite a plain façade we naturally are led to examine any special feature such as a beautiful porch or bay. If the object be lifted up in fig. 43 the attention is more powerfully attracted, as might be naturally expected.

Concentration in design is concentration in work, the outcome of a powerfully concentrative mind. The correlative state to mental diffuseness would be, in architecture, an "all-over-alike" effect. The best example of scatter-brained architecture is seen in examining a design where all necessary features are slurred over, and a hasty endeavour evidenced to elaborate plain wall surface. The one patent fact evidenced in such cases is a complete lack of grasp of the problem. This is always to be noted in addition to the actual neglect of the requirements of concentration. The surest sign of competent architectural work is the attention bestowed on small necessary features (as door and window) in a plain block of building. The most certain evidence of an absence of this is the lean, starved, badly-proportioned, badly-arranged window and door. Modern domestic architecture will everywhere bear witness to the truth of the statement. For, not to go further than the humblest house building for examples, how often is an otherwise uninteresting domicile rendered attractive by a little concentrated thought or design in say a porch or bay window?

The great benefit of concentration is that it economises our powers and resources. The scatter-brain is really doing (or trying to do) several things at once, and probably, even after all, his mind is continually on the wander from subject to subject. Power arises from concentration of energy, a concentration on some definite purpose with some definite aim and goal. It is moreover the essence of effect, as such. A few diamonds scattered over a table do not have the potency of effect on the eye of the same gems concentrated into a ring. Hence in the same way so much enrichment bestowed over the part of a building cannot have the same powerful effect on us that it does when concentrated into the (approximate) point. Concentration and condensation are terms of practically similar import in questions of design. The considerable cloud of vapour necessary to form a gem-like dew-drop may be exemplified as an example of concentration and its effect. Before was diffuseness—that which was "without form and void." A regiment of soldiers diffused over Salisbury Plain cannot have the effect of the battalion close-phalanxed. The life of the plant is in some measure concentrated in the flower—an instance more of concentration of time effects. The sculptor's work in a Gothic capital, at say Lincoln, would never be so effective if diffused over shaft and base as well.

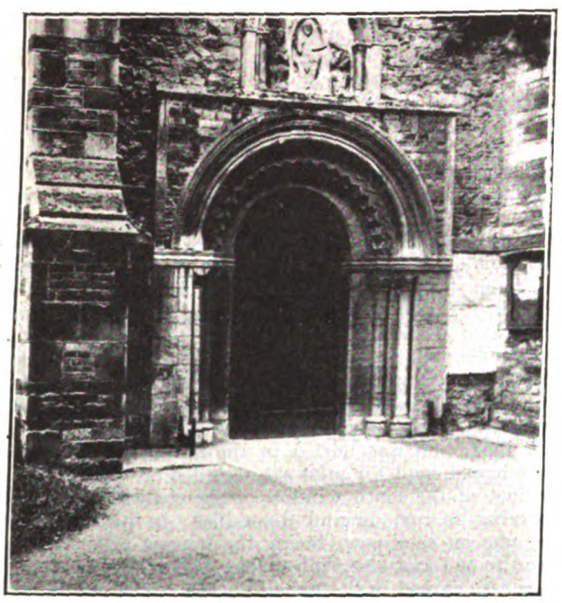
If we rightly understand the principle and the whole signification of concentration in art matters, we shall never be "bizarre." It will be impossible to be vulgar. The "low," the loud, building is always characterised by prodigal diffuseness. Its "decorations" gossip.

An idea of a whole conception—a theme—is after all a condensation from that which was diffuse, nebulous. So we have condensation upon condensation—the façade as an entity and the window as an entity on that, the shaft in the window again, and the cap on the shaft, all concentrations from the primordial substance, the architect's memory or note-book perhaps, unfortunately. The concentrator arrives at clear-cut aims, he does not get a mixed-up jumble of incongruities, or half, and ill-considered ideas. He speaks not with uncertain tongue. His issues are plain, and his ends always definitely in view. He does not waste either space, material, or time

Digitized by Google

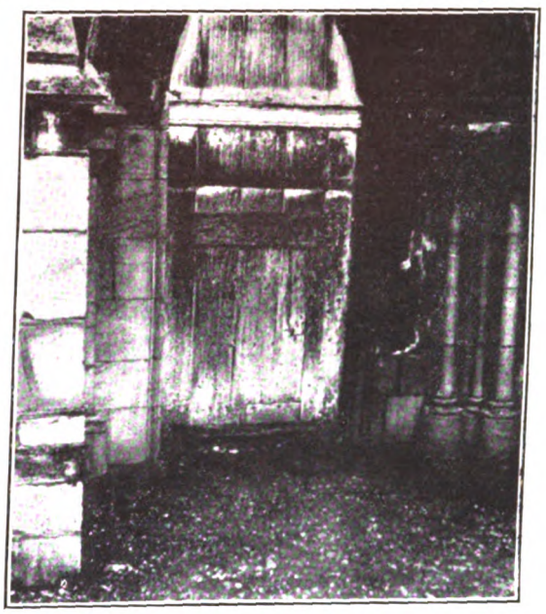
(1) because he gets by concentration the required object and required effect in the least possible space; (2) because he uses the least possible material substance to accomplish his aims; and (3) because concentrating his energies, he accomplishes his object with the least delay, and without hesitation. It will be observed that concentration is a high faculty in art, and if not intuitive (which it seldom can be) comes by experience alone.

(To be continued.)



ELSTOW, SOUTHILL, OLD WARDEN AND WARDEN ABBEY.*

ELSTOW (Helena's Stowe), on the Ouse, one mile south of Bedford, was once a market town, with a market hall, known as the Moot House, still standing at the end of the Green, a brick and timber building, lately used as a chapel and erroneously stated to have been the guest hall of the abbey. At the western end is a stump of an old stone cross. The village will be for all time noted as the birthplace of John Bunyan, the tinker's son, himself a tinker, preacher and author, who suffered for conscience sake. He was born in 1628 and was baptized in the church on November 30, in that year, died at the house of a grocer, at the sign of "The Star" on Snow Hill, Holborn, August 13, 1688, and was buried in Bunhill Fields burial-ground, in the city of London. His ancestors are known to have lived in Bedfordshire from 1199, if not earlier, and their connection with Elstow dates from 1327. A well-known cottage, recently almost rebuilt, with two small gables, standing alone on the Bedford Road, which we have passed to-day, was occupied by him after his marriage in 1646, but that in which he was born exists no longer.



In the time of Edward the Confessor, Elstow, then known as Elnestou, was part of Meldone (Mauldon), but paid "geld" to Camestone (Kempston). It was valued at 10*l.* and was held by four sokemen, who could assign or sell it. Saca and socn were granted by the king, and conferred the power of holding courts for settling disputes and imposing penalties, and the tenants of the lordship who were free husbandmen were the socagers or sokemen, virtually the jurors.

The Benedictine nunnery, dedicated to the honour of the Holy Trinity, St. Mary and St. Helen, was founded in 1078 by Judith, daughter of Adelaide, Countess of Aumale (half-sister of William the Conqueror) and widow of Waltheof, Earl of Northampton and Huntingdon, probably as an atonement for her husband's death, caused by her giving information of his disloyalty to the king, by whom the nunnery was in part endowed. It was secured by many royal charters, granted by Henry I. and other succeeding kings: Henry II. granted two, one for a fair to the nuns for four days, on the Vigil of the Invention of the Holy Cross, the day of the Festival, and two days after. At the date of the Dissolution the abbey was in possession of twenty-one nuns, besides the abbess, Elizabeth Boyville, and was surrendered August 26, 1540, and was then valued at 284*l.* 12*s.* 11*d.*, according to Dugdale, and 325*l.* 2*s.* 1*d.*, according to Speed. By the first scheme of Henry VIII. and Bishop Gardiner, Elstow was to be retained as a cathedral for Bedfordshire and the Act was passed in 1539. The site was granted by Edward VI. to Sir Humphrey Radclyff, a younger brother of the Earl of Sussex, by deed, dated July 3, 1553, three days before the King's death. Sir Humphrey died August 13, 1566, aged 57, and was buried in the church

From his successors Thomas Hillersden purchased the whole of the property for the sum of 700*l.*, including the advowson of the vicarage, and erected a mansion house probably in the reign of James I., and called it Elstow Place: of this building little now is left save a ruined façade, with square mullioned windows and a Jacobean porch. A most important piece of the original nunnery, said to have been the chapter-house of the novices, or "white-veiled" and non-professed sisters, is now used as a vestry, attached to the south aisle of the church. It is a square chamber with a rather low vaulted roof, supported by a central pillar of dark Purbeck marble. In 1792 the manor was purchased by Samuel Whitbread, Esq., and is now in possession of his direct descendant. Elstow Church consists of choir, with clerestory, lofty clerestoried nave, aisles, north porch, a vaulted chamber on the north-west and a detached tower. The clerestory of the choir is Norman, that of the nave Early English; in the two western bays of the nave are rich Early English arches, on transitional pillars; the three eastern bays and aisles are Norman. The former chancel extended 77 feet farther east and ended in an apse, beyond which was the lady chapel, and according to Wigram there was a central tower. In the present east end are three Perpendicular windows, beneath which is a half-length mural monument, with kneeling figures of Sir Humphrey Radclyff (owner of the abbey estates) and his wife. The font and ceiling are Perpendicular. The south aisles appear to have been widened, and the north Norman doorway must have been moved out to its present position. Over this door (exterior) is some Saxon sculpture, representing Christ, St. Peter with the keys, and St. Helena. In the south aisle are two brasses with female figures, one of a widow who died 1427—Margery, daughter of Ralph Parlys, who married, in 1396, John Hervey; her second husband being Sir William Argentine. This Hervey was the grandfather of the abbess Elizabeth Hervey of the other brass, who was the last abbess but three, and died in 1524. It displays the finest existing effigy of a Benedictine abbess, with cowl, large loose gown, mantle, cap, and veil falling to the shoulders. The chin and front of the neck are concealed by the plaited wimple, and on the right arm rests the pastoral staff. In the inscription, the day, month and year of her death are left blank, suggesting it had been made in her lifetime and never completed. In the north-east corner

NORMAN DOORWAY, ELSTOW CHURCH.

WICKET GATE, ELSTOW.

* Read at a meeting of the Upper Norwood Athenæum by Mr. T. G. Larkin.

Digitized by Google

is the tomb of Mr. Crompton, the magistrate who committed Bunyan to prison; also a stone coffin of the twelfth century, with the remains of a fine cross on it and some good tiles. There are also some recent stained-glass windows commemorative of "The Pilgrim's Progress" and "The Holy War," inserted at the east end of the aisles. Part of the chancel screen and some old pews yet remain; the seat said to be Bunyan's is against the first Norman pillar north. The register dates from 1640. The church was restored in 1882 by Samuel Whitbread, Esq., at a cost of 6,000*l*. The massive tower is entirely detached and is, therefore, a true campanile; the bells were five in number, dating from 1604 to 1655, but the present Vicar, the Rev. C. F. B. Hawkins, added a sixth, Christmas 1908. No. 4 is said to be the one Bunyan rang. It is supposed the lower part formed a portion of the exterior of the nunnery, and was a convenient foundation for a new tower in which to hang the bells. The tower was restored by Mr. F. S. Wigram.

Southill.

In Saxon times Southill, which included Stanford, must have been a place of considerable extent and importance, for in the Survey there are no less than fourteen separate memoranda respecting it. It was then known as Sudgivele, or South Yevell, and in the time of Edward the Confessor, the chief owners of the land, besides the king, were Archbishop Stigand; three thanes named Ulmar, Lemar, and Lewin; and Aldric, Aeilmar, Tuffa, and Ordui. William the Conqueror included a part in the marriage portion of Azelina, and the rest was bestowed on Eudo, Hugh de Beauchamp, William Speck, Richard Pungiant and Walter, Ordui's portion not being interfered with.

It is situate eight miles south-east from Bedford. The ancient church, dedicated to All Saints, is a brick structure of the Early Decorated period, with chancel, nave, north and south aisles and south porch, and Perpendicular, embattled tower at the west end containing clock and eight bells. The register dates from 1538. The interior was modernised, somewhat crudely, in 1814-6, and contains little of interest. On the wall of the south aisle is a monument to Edward Dilly, bookseller, of London, at whose house in Southill, Johnson and Boswell were occasional visitors. The most interesting object is the Torrington mausoleum, or "columbarium," attached to the east end of the church and entered from the outside. Herein lie the first viscount and his descendants, the Byngs. One vault in particular is worthy of note, as it contains the remains of Admiral John Byng, fourth son of the first Viscount Torrington, whose retreat cost us Minorca, for which he was court-martialled and shot. He was born in 1704, and put to death on board the *Monarque*, at Portsmouth, March 14, 1757. The inscription over his tomb, said to have been inspired by Johnson, reads as follows:—"To the perpetual disgrace of Publick Justice, the Honble. John Byng, Esq., Admiral of the Blue, fell a Martyr to Political Persecution, March 14, 1757, at a time when Bravery and Loyalty were insufficient Securities for the Life and Honour of a Naval Officer."

Southill Park is some 4½ miles in circumference; it contains many fine trees, including some cedars, also a lake of about 60 acres, and in the seventeenth century was in possession of the Keeling family. In the commencement of the eighteenth century the house and grounds passed by purchase to Sir George Byng, who was knighted by Queen Anne in 1704 for capturing Gibraltar; in 1715 he was made baronet, in 1721 sworn of the Privy Council, in the same year created Viscount Torrington and Baron Byng of Southill; in 1725 K.C.B., and on the accession of George II. in 1727, First Lord of the Admiralty; he was M.P. for Plymouth from 1706-21, and died January 17, 1733. His descendants dwelt here until 1795, when Samuel Whitbread, Esq., bought the estate, but only lived there a few months, as he died in 1796. During this short period he engaged Holland, the architect, and enlarged the building. The original mansion was the central portion only of the present house, and rested upon a vaulted basement, which he cased in stone and added wings on either side, making it a building of great size and some architectural pretension. The glory of the house is its portraits, and we are much indebted to the present Samuel Whitbread, Esq., and Lady Whitbread for their kindness in allowing us to view them, for so hospitably entertaining us, and with the assistance of their son personally conducting us over. The paintings are by Sir Joshua Reynolds, Sir W. Beechey, Gainsborough, Hoppner, Northcote, Opie, Romney, Wilkie, and many others; the busts by Weekes and others. There are also memorials of John Howard, the philanthropist, who bequeathed his house at Cardington to the Mr. Whitbread who purchased this estate. A souvenir of the visit was given to the leader by Mr. Whitbread, being six sealing-wax impressions of a brass seal found in the walls during the demolition of a cottage at Elstow. It is of thirteenth to fourteenth century. There is little doubt that it is a figure of St. Helena, as it is very like the representation of her in the Saxon sculpture over the north Norman doorway in Elstow Church.

Old Warden.

There are three entries of Warden in Domesday Book. "In Wardone William Spec holds nine hides of the king as one manor. . . . It is worth 6 pounds, as much when received and T.R.E. 8 pounds. This manor 8 sokemen held and could assign their land to whom they would.

"In Wardone, Ralf de Insula holds of the king 1½ virgates. This land belongs to Bicheleswade and it is valued there, and he who held it T.R.E. could not assign or sell it without the leave of him who held Bicheleswade.

"In Wardone, Walter, a monk, holds half a hide of Azelina, and this is of her marriage portion. There is land for a half plough, but it is not there; 1 bordar is there. Meadow for a half plough team and woodland for 40 swine. It is worth 10 shillings, when received, and T.R.E. 20 shillings. This land Goding, a man of Edric the Bald, held and could assign to whom he wished."

The unique model village, as we now see it, is possibly the most picturesque in England, situate eight miles south-east from Bedford, and owes its popularity to Robert Henley, third and last Baron Ongley, who lived in Warden House, Old Warden Park (rebuilt by him in 1872), where his ancestors had dwelt since 1690. He it was who devised the quaint houses we have seen, with thatched roofs, carved rustic woodwork, red painted doors and windows (to harmonize with which the tenants in his time wore red cloaks and tall hats), and this style of building has been well maintained by his successor, Colonel Frank Shuttleworth, whose lodge gates we passed on our way to the church, and to which I specially drew your attention, as they are very handsome.

William Espec, being Lord of the Manor of Warden at the time of the Survey, there is little doubt but that he built the manorial church, and his descendant, Walter Espec, having founded the abbey, enriched it by granting the church to Simon, the first abbot. On Walter's death his property passed to his sister's son, William de Bussey, who confirmed the grant to the abbey. His daughters and coheiresses, Cecily and Maud, in 1199 claimed the advowson as theirs, stating that the late priest Nicholas de Trailly had granted it to them. However, Abbot Warin, by producing his charters, retained his rights. The present church is a stone building, with Perpendicular chancel, separated from the nave by a pointed arch; south aisle, south porch, and an embattled western tower containing six bells. The porch is square and ornamented with carved pinnacles, with some curious corbels at the base, between the two pinnacles a Roman cross, and inside are two ancient windows, without glass. The church, which is dedicated to St. Leonard, was repaired 1841-2, when the stained-glass windows were inserted, and the rich black oak introduced, which was brought from old religious houses in Italy and Belgium; the finest pieces, I believe, were in the old black oak organ, which, when I saw it some years ago, was in the south gallery, but I understand it has been removed to Warden Park (probably when the new organ was erected in the tower arch by Colonel Shuttleworth in commemoration of the first jubilee of Her Majesty Queen Victoria, in 1887). The whole cost was defrayed by the aforesaid last Baron Ongley, who died in 1887, and was buried in the family mausoleum in the churchyard, and his gifts are recorded on a mural tablet at the foot of the south window of the chancel. The black oak carving is curious and diversified, in particular two snakes, one on each pew, facing the narrow aisle, reaching from end to end and about 6 feet long, are worthy of note. A snake is also carved in the panel beneath. The pew immediately behind is ornamented with Decorated crockets, consisting of broad raised leaves attached to the moulding by the points. The balusters to the gallery are carved to represent grapes and vine leaves. The vicarage pew in the chancel has a baldacchino of richly carved oak and is fitted with a hagioscope. Carved representations of holly leaves, berries, flowers, fruits, cones, acorns, and various leaves are to be found throughout the building, many of them very richly clustered; figures of saints are also seen in several panels. The roof of the nave was constructed from oaks grown in the park. At the west end is a full length marble statue of Sir Samuel Ongley, knight, and it

Digitized by Google

is strange that a London merchant should appear in the dress of a Roman, with toga, &c. He was director of the East India Company, first Deputy-Governor of the South Sea Company, M.P. for Maidstone, his native place, and died August 25, 1726, aged 80. There are other monuments and tablets to members of the Ongley family, and the walls of the church are decorated with their hatchments. Their arms, too, can be seen in the chancel roof. There are also memorial windows and tablets in connection with the Shuttleworth family, and their richly-carved pew in the middle aisle is also fitted with a hagioscope, and above it, in the angle of the wall, is a white marble memorial to Caroline Jane Shuttleworth, who died December 28, 1899, and is the work of Mabey, of Westminster. It represents the life-size figure of a beautiful woman clinging to the Cross and seated. The everlasting rock is emblematical of "Faith." The figure is surrounded with a polished alabaster niche, supported by a corbel containing inscription, arms, &c., the two columns having entwined round the lower part the lily and passion flowers. In the two spandrils are the emblems of the Cross, the crown of thorns and the chalice. In the frieze over the head is the crown of glory mounted on a shield, with palms of victory. At the summit are groups of celestial cherubs hovering over the monument.

Over the altar is a fine copy of Guercino's "Ecce Homo," and on the south side of the sanctuary is a cinquefoiled arched piscina, in good preservation. The central window on the north side of the nave has some very rare old glass, said to have come from Warden Abbey; it depicts one of its abbots in the white Cistercian habit and with the pastoral staff. Another in the south aisle is interesting; it was presented by Frank Shuttleworth in commemoration of the Coronation of King Edward VII., but is dated June 26, 1902, the date originally fixed for the important function. The twelve-sided Tudor font was obviously for immersion, its inside diameter being 28 inches. The register commences in 1576. There is a costly marble cross in the churchyard to the memory of the late Mr. Joseph Shuttleworth.

Warden Abbey.

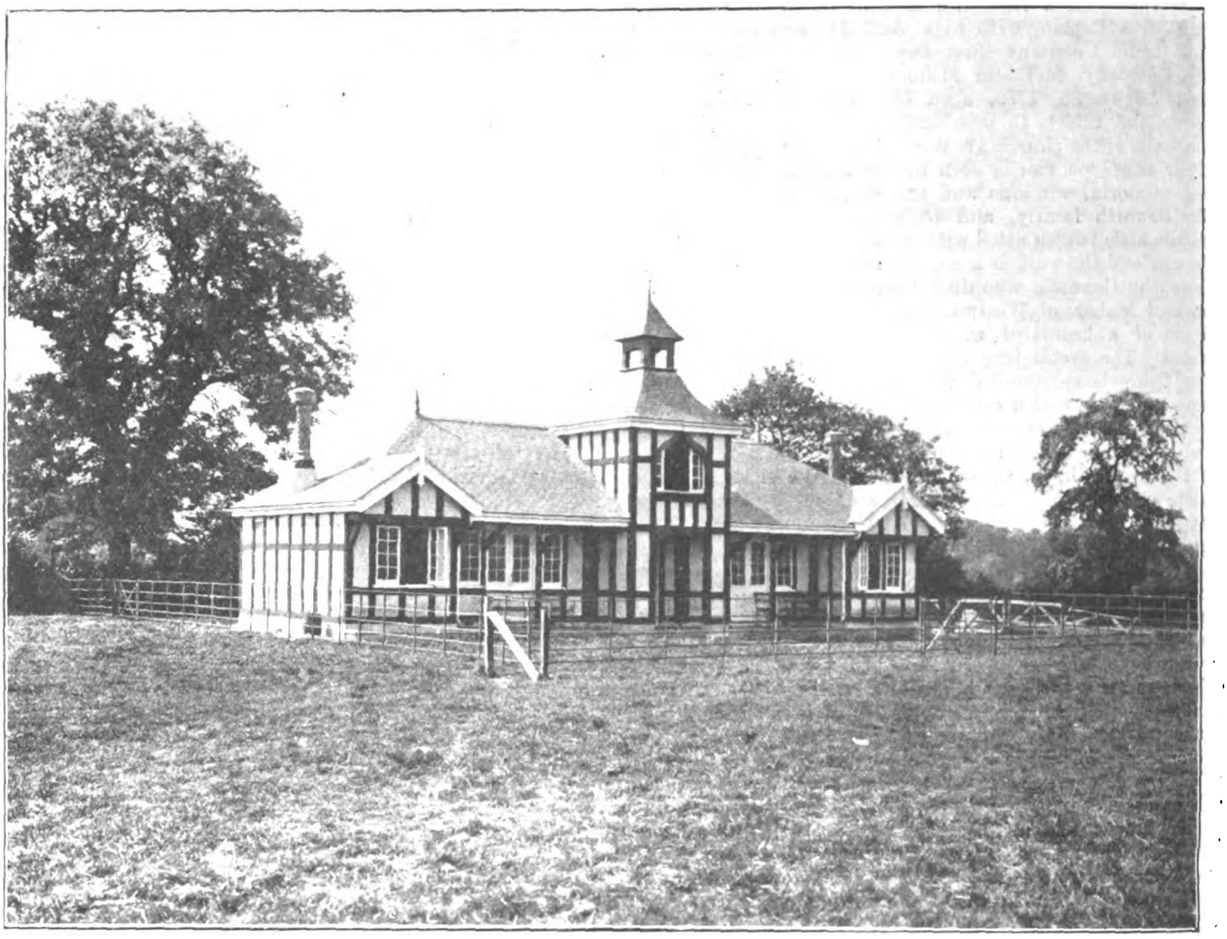
Warden Abbey, or de Sartis or Assartis, so-called because it was built in a place which had formerly been a wood but was afterwards grubbed up and cleared, was founded A.D. 1135 by Walter d'Espec (Spec), the great baron who led the English at the "Battle of the Standard" in 1138, and died, a monk, in his own abbey of Rievaulx in 1153. It was for Cistercian monks, colonised from Rievaulx and dedicated to the Blessed Virgin Mary, as all such were, and its foundation charter was confirmed by Stephen in the same year. The Cistercians were a more austere branch of the Benedictines and took the name from Citeaux, in Burgundy, and were founded by Robert de Molesme and Stephen Harding, an Englishman, of Sherborne. They were called White Monks from their habit, were great farmers, and lived as a rule 10 miles from any town; their latest house, however, was built on Tower Hill. Their first abbey was at Waverley, near Farnham, Surrey, 1128.

Among the Warden benefactors were Henry Braybrook, his wife Christine (who owned the manor of West Warden, in Northamptonshire), and their son Wischard; Simon, Hugh, and William de Beauchamp; Malcolm IV. of Scotland; and Roger de Quincy, constable of Scotland; and so lands in Huntingdonshire, Hertfordshire, Northamptonshire, Norfolk and Suffolk passed to the possessions of the monks.

All the abbeys of the Cistercians were exempt from ordinary visitation, and the abbots of Warden were held in the highest esteem and were commissioned to enquire into various ecclesiastical questions that arose, first by King John in 1215, the year of Magna Charta, as to the election of the Abbot of St. Edmund's, and by the Pope Honorius III., in 1217 and 1224, as to the election of the Abbess of Shaftesbury and the Abbot of Tewkesbury.

In 1217 Fulk de Brent, one of the most powerful nobles of the time, was scourged in the chapter-house because he imprisoned 30 of the monks in a dispute about a wood. He not only submitted himself to corporal discipline, but confirmed to the abbey the rights to the wood in question. In 1242 Abbot Adam was made Bishop of Connor, but he returned to the quiet of Warden to spend his last hours. Early in the fourteenth century a Templar was ordered by Bishop Balderley of Lindsey (Lincoln), in whose great diocese the abbey stood, to do penance at Warden. Although one of the richest abbeys in Bedfordshire, the abbot was licensed to beg for money to rebuild the abbey. The work was commenced in 1323, and on its completion in 1366 Bishop Gynwell granted indulgences to all pilgrims who prayed at its altars. The peaceful life of the White Monks of Warden reached the ears of a monk at St. Albans, and Abbot Thomas de la Mare, a little prior to his death in 1396, permitted him to join them. The first abbot was Simon, the last was Henry Emery, and at the visitation in 1535 the possessions were valued at 389*l.* 16*s.* 6½*d.* Emery, wise in his generation, at once wrote to Thomas Cromwell, complaining of the laxity and insubordination of the monks, and so probably obtained a pension, and he consoled himself by marrying a Minoress of London. Its annual revenues at the suppression, according to Speed, were worth 442*l.* 11*s.* 11*d.* It was surrendered by the abbot and 14 monks, December 4, 1538.

The refectory is the only portion now remaining, but Miss Woodward, who lives opposite the ruin, has an old print showing the abbey as it stood in times gone by, a reprint of which you will find in a pamphlet on Old Warden, written by Constance Isherwood, and published by Paternoster & Hales, of Hitchin, which gives a very interesting account, and to which I refer you. The abbey must have been remarkably imposing and effective, judging by the print and the remains now existing, and will appeal to all who take an interest in the historical and beautiful buildings of our land. The ruins bear the characteristic features of the Perpendicular period. The oriel and other windows without cuspings and the crenellations or embattlements and the red brick work are common features of this period; the ogee headed doorway, with the crockets and finial and the remains of a fluted shaft terminating in a finial on the right-hand side of the opening on a corbel of grotesque character, although worn, are interesting, and the spiral brick chimney shaft set upon its stone crow-stepped base is a gem probably difficult to surpass, and well deserves the closest attention. The fireplace and ceiling of the lower room, though dilapidated, will repay an examination. The original building had three projecting bays, the centre one of which was the entrance. The arms of the abbey were *three pears, or, in a field, az.*, and represent the famous Abbott's or Warden's pear well known to this day. "Warden pie" is referred to in the famous song "The Friar of Orders Gray," so the place was famous for its flesh and fowl as well as its fruit.



The property passed through many hands after the Dissolution. In 1669 Sir Ralph Bovey possessed it. The late Samuel Whitbread, Esq., purchased it, as he was desirous of preserving it, and the foundations of the abbey were uncovered in 1838, when stone coffins, some containing skeletons, a crozier, and other remains were found. There were also discovered several fragments of carved wood, bosses, &c., on which the painting and gilding retained its original brightness, and subterranean passages have been found during digging operations at various times. It is a great pity the interior is in such a neglected condition.

In compiling this paper I am indebted to the following works, amongst others:—Tanner's "Notes of the Monasteries," Bonney's "Cathedrals, Abbeys and Churches," "Chronicles of the Abbey of Elstow," by S. R. Wigram, M.A., "English Minsters," by Mackenzie, "The Victoria History," Murray's "Handbook of Bedfordshire," and Foster's Guide; "Old Warden," by Constance Isherwood; and the assistance given me by Mr. W. F. Harradence I gratefully acknowledge.

GLASGOW INSTITUTE OF ARCHITECTS.

A QUARTERLY general meeting of the Glasgow Institute of Architects was held last week in the Secretary's chambers, 115 St. Vincent Street, Mr. George Bell, F.R.I.B.A. (President), in the chair. Reference was made to the death of Mr. John A. Campbell, F.R.I.B.A., who had been a member of the Institute since 1889, and it was reported that the Council had minuted an expression of regret at Mr. Campbell's death. It was intimated that Mr. Robert Hall, Inveresk Place, Greenhill, Coatbridge, had been elected an Associate member. The Secretary submitted a report on the matters which had been dealt with by the Council since last meeting. 7*l.* 7*s.* had been granted to the Glasgow School of Architecture for prizes, and the proportion of these prizes, amounting to 2*l.* 2*s.*, granted to the Technical College section of the School of Architecture, had been awarded to Mr. Joseph Wilson, 6 Jedburgh Gardens, North Kelvinside. Local examinations of the R.I.B.A. were held on June 14, 15, and 16 last, and at the request of the R.I.B.A. the Institute has agreed to undertake the conduct of a local preliminary examination on November 8 and 9, and a local intermediate examination on November 8, 9

NEW PAVILION, ST. DAVID'S COLLEGE, LAMPETER.

and 10. On the representation of the Council, the Govan School Board had exhibited the designs submitted in the competition issued by them for a new school; and the Hamilton (Burgh) School Board had also arranged to exhibit during last week in the Hamilton Public Library the plans submitted for their new academy. A by-law had been framed which gave student members of the Institute representation on the committee of the associate members. It was intimated that the Council had under consideration the arrangements for an early exhibition of architectural work.

NEW PAVILION FOR ST. DAVID'S COLLEGE, LAMPETER.

A PAVILION has this season been erected on the cricket field belonging to St. David's College, Lampeter. The style adopted is the black and white timbered Tudor, of which a good many examples remain in some parts of Wales, notably in Montgomeryshire; but the red chimneys with diagonal and panelled patterns are reminiscent of the East Anglian architecture of the same period. A feature of the building is the bell-tower, which occupies the centre of the front and forms in its lower part an open porch, flanked by a verandah on either side. Above the porch is a chamber providing a point of vantage for the scorers at cricket matches. Within the pavilion are a club-room and a dressing-room, both opening on to the verandah in front. At the back are pantry and lavatories. The front and side walls are of half-brick, built between the wooden framing and faced with cement. The timber work on the outside and the rafters within are painted with Major's Solignum in dark brown tint, while the rooms have a dado in unplaned wood treated with green Solignum. The architect was Mr. Ll. Bankes-Price, of Lampeter, acting in consultation with Professor Tyrrell Green, of St. David's College. The chimneys, finials, &c., were supplied by Messrs. Dennis, of Ruabon, and the work has been satisfactorily carried out by Mr. William Jones, builder, of Lampeter. The total cost of the pavilion may be put down at 300*l*. Our view is from a photograph by D. J. Davies, of Lampeter.

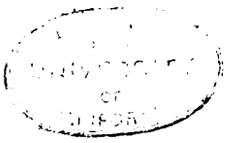
ILLUSTRATIONS.

Selby Abbey.—South-west view—South-east view—South side—Tower and north transept.

OUR illustrations, from photographs specially taken for us since the reopening of Selby Abbey on Tuesday in last week, show the present condition of the church after restoration by Mr. J. Oldrid Scott, F.S.A., of which a full account will be found in our leading article.

Cottages at Beaconsfield, Bucks.

THIS group of cottages is designed for the employees on an estate near Beaconsfield, Bucks, and the accommodation consists of two living rooms and three bedrooms. The half-timbered work is to be of English oak and the roof is to be covered with old tiles from farms which have been pulled down on the estate. The contract price for these cottages is 875*l*. The architect is Mr. Stanley Hamp, of the firm of Collcutt & Hamp, and the drawing we reproduce was exhibited in this year's Royal Academy.



Liverpool University School of Architecture.—Detail from Trinity College, Cambridge.

THE detail from Trinity College, Cambridge, shows the kind of work done by the students of the Liverpool University School of Architecture during their vacations, and is in further illustration of our leading article of last week.

Blantyre School Board, N.B., has decided to erect two new schools in Calder Street, Blantyre. One of the schools is to be for elementary education and the other for higher grade education, the total cost being 10,000*l*. It was agreed to have competitive plans from eight architects. Mr. William B. Dow, Glasgow, was appointed measurer for the new buildings.

From a Sketch by Banister Fletcher.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last in the premises at Tufton Street, Westminster, Mr. Henry Tanner, F.R.I.B.A. (President), in the chair.

On the motion of the President, seconded by Mr. Henry T. Hare, the Council's report and balance-sheet for last session was unanimously adopted.

The following gentlemen were elected members:—Messrs. George West, T. B. Whinney, M. Robertson, E. T. Dunn, H. C. Pullin, C. E. Worthington, E. A. Stone, C. A. R. Barry, T. J. Burnie, E. K. Smith, L. R. Thomson, A. B. K. Cook, W. W. Nimmo, H. D. Hendry, K. B. Mackenzie, H. R. Chanter, L. E. Williams, H. Sawyer, E. Belfield, N. F. Woodroffe, S. J. Edwards, G. B. Owen, P. H. E. Bagenal, N. C. Theodossatos, C. E. FitzSimon, R. Kirby, W. A. C. Adams, T. F. Ford, W. F. Dawson, H. J. Birnstingl, W. T. Ching, S. T. Nunn, H. E. Breach, J. B. M. Walch, E. L. F. Davey, G. W. Stuart, C. C. Sealy, E. R. Jarrett.

Mr. F. Dare Clapham, F.R.I.B.A., read a paper, illustrated by sketches and lantern views, entitled:—

Cheltenham and District.

It was in 1895 that the Architectural Association first visited this district, and most of the places then seen were again on the programme for this year. As before, our headquarters were at Cheltenham, and it is interesting to record that there were, out of the twenty-six members who formed this year's party, nine who had been on the earlier excursion. All the places visited were, with the exception of Gloucester, in the Cotswold district, which lies to the east of Cheltenham.

Geologists inform us that at a certain remote period in the history of the earth, Leckhampton Hill, which rises above the town of Cheltenham, was a high cliff, overlooking the sea, that this sea entirely covered the valleys which now extend from the Bristol Channel to the North of England, also that the hills in the immediate neighbourhood, Bredon and Churchdown were islands rising out of these waters. They were bounded on the west by the Welsh mountains, and in course of time a great upheaval of the northern portion took place, so that the lower part became an estuary running up from Gloucestershire into Worcestershire and Warwickshire.

From the number of barrows and weapons which have been discovered in this district, it was probably a popular one with the Ancient Britons, and when in the middle of the first century the Romans conquered this part of the country they raised and enlarged the earlier fortifications.

It was in the year A.D. 43 that the Romans completely routed the British army and drove them from the Cotswolds, the city of Gloucester being captured by the Emperor Claudius himself. They established a chain of watch-towers on the various hills and built several military roads—Ermine Street, between Gloucester and Cirencester, the Fossway over the Cotswolds to the north, and Icknield Street, which led to Wales—these exist to the present day.

Christianity was introduced soon after the Roman Conquest. Probably this district was the first to embrace the Christian faith, and it is believed that St. Paul himself preached in Gloucester.

The Romans existed in these parts for a period of 400 years, and, as showing the extent to which they populated this neighbourhood, out of just over 300 parishes in Gloucestershire, Roman remains have been found in about a third. They soon discovered its fertility, for about the end of the third century they started to cultivate vines, and in the earliest Anglo-Saxon charters vineyards are constantly referred to, and the willow is mentioned as being cultivated for binding the vines towards the end of the sixth century.

The Saxons defeated the Romans in a big battle at Derham, capturing the two Roman cities of Gloucester and Cirencester, and during the Heptarchy this district became incorporated in the kingdom of Mercia, and Cheltenham, which occupied a position between the two royal residences Winchcombe and Gloucester, became an important place, and the manor was the property of the Crown.

A Benedictine priory was founded in Cheltenham at the end of the eighth century, and about 100 years later a monastery was built by King Offa in the village of Cleeve.

In the middle of the eleventh century King Edward the Confessor became Lord of the Manor of Cheltenham, and granted it a charter, and from that time until the reign of James I. the manor was generally held by the reigning monarch.

In the year 1628 the Prince of Wales, afterwards Charles I., sold the manor to John Dutton for 1,200*l*. It remained in the Dutton family for over 200 years, and in 1776 was sold to Lord Sherborne, and when it was again sold in 1843 it realised 39,000*l*. While on the subject of land it is interesting to record that in 1086 William the Conqueror, while holding his Parliament at Gloucester, decided on the survey of England, known as the Domesday Book. In this record Cheltenham is spelt Chinteehe, about twenty years later it was spelt Chilt, and the modern spelling of the name does not occur in any documents until the Manor Act of 1625.

In the middle of the fifteenth century the town seems to have fallen on evil days, for an Act was passed releasing the lay people of the town from local taxes on account of the poverty of the place, and in 1468 the town petitioned the Queen to allow them to discontinue the sending of two members to Parliament on account of the expense. A few years later Edward IV. halted in Cheltenham for a short time with his army on the eve of the battle of Tewkesbury. The town seems to have suffered during the Civil Wars, and afterwards its history is so obscure that it probably degenerated into quite a small village, for in 1666 there were only 1,500 inhabitants and just over 300 inhabited houses, and even 130 years later there was only a slight increase in the population. It was at this time, however, that the mineral waters were discovered, and the prosperity of the town was renewed, for in 1811 the inhabitants numbered 8,000, and in 1861, 36,600.

In the early part of the seventeenth century this district was noted for the cultivation of tobacco. It was a flourishing trade in 1652, when in order to encourage the English plantations abroad an Act was passed "prohibiting the planting of tobacco in England," which, as recorded in the "perfect Diurnall" of the House of Commons, "materially affected the interests of many persons in Gloucestershire, particularly Cheltenham and Winchcombe." The inhabitants of these two towns petitioned against this, but without success, and troops were sent from Gloucester to destroy the plantations, but the people drove them back; the industry, however, seems to have gradually died out.

Cheltenham has been termed the Garden City, and it certainly abounds in gardens, both public and private; it is beautifully situated in the valley of the Severn at the foot of the Cotswolds, which bound the valley on the east side, while on the west are the Malvern and Forest of Dean Hills. From these hills come numerous springs, forming brooks,

Digitized by Google

which run through the villages of the district and make them so picturesque. At Seven Kings, about four miles from Cheltenham, the river Thames has one of its sources.

The Cotswold district was for centuries celebrated as the centre of the sheep-farming industry, and even 800 years ago wool from this district was exported to Flanders and elsewhere, and, judging from the size of the farms and the outbuildings generally, the farmers three or four centuries ago must have been very prosperous.

The Domestic architecture is probably as interesting and characteristic as that of any other part of the country. Its chief charms are its great simplicity and splendid proportion. The character of the work is generally the same owing to the natural use of local materials, built according to local traditions, and influenced by surrounding conditions.

The houses were generally built in some sheltered position, often on sloping sites, but beyond this precaution very little attention seems to have been paid either to aspect or situation. The whole district being a stone one, all buildings were constructed in limestone, usually quarried from the immediate neighbourhood. The stone weathers well, and when first quarried is distinctly yellow, but it soon tones down and takes on after exposure all kinds of beautiful greys and yellows. In the better class of work the exterior walling was executed in ashlar, carefully dressed, with upright joints, and laid square on bed. The plans of the houses were very simple, and the stone outer walls were 2 feet to 2 feet 6 inches thick, the internal divisions being simply lath and plaster or oak panelling. In order that they might be roofed in one span the plan was usually one room deep, the rooms being 16 feet to 20 feet wide. The roofs were of a steep pitch, and covered with stone slates laid in diminishing courses, and the roof space was used for bedrooms and lighted by windows in the gable ends or by dormers. Very often the wall plate was placed in the centre of the wall, and the stone slates at the eaves were bedded on the wall with only a slight projection, which gave a considerable tilt to the eaves. There were no gutters, and at the inter-sections of the roofs the stone slates, which were laid without any torching, were brought round in a sweep, a method known locally as "galetting," and the ridge-piece, too, was sawn out of a block of stone. In many cases the copings to the gables are only a few inches higher than the stone slating behind, and in the smaller houses the slates simply project a little in advance of the wall face. The chimneys were usually carried up centrally over the ridge, the flues being built separately, either square or diagonally in groups of three or four; they were formed of thin sawn blocks of stone, and finished with a moulded cornice and a weather mould at the base as a protection to the roof. The finials on the top of the gables and over the springing stones are of great variety, and were often pierced on all four sides. The windows have stone mullions with square heads and a label mould over. These labels were very often carried round the house as a string course, and in several houses there is a set-off at each string course. The lights were narrow and squat, and usually decreased in number on each succeeding storey. There was generally a thicker central mullion where the lights exceeded three in number. The lead glazing of the windows was ornamental, and the opening casements were fitted with wrought-iron fastenings, very often beautiful in design, and showing what excellent work used to be executed by the local smiths. There was no external porch, and where one does occur it has usually been added at some later date. The doorways were simple, the doorhead being, as a rule, four-centered and out of one stone, and internally there was no arch, but always a flat lintel. All the original doors were plain, and, like the windows, the wrought ironwork was always good in design. A predominating feature of the inside of the houses was the large open fireplace, very often of great width compared with the size of the rooms. The staircase was placed in the centre of the house, and in many cases had a solid newel about 5 feet square, with solid oak treads, and when the house was built on a sloping site the different levels were very cleverly arranged. Most of the work in the district was executed between the end of the sixteenth and the close of the eighteenth century.

About five miles to the north-east of Cheltenham is Postlip Hall, picturesquely situated on the slope of the hills and overlooking a valley on the south. Originally the house consisted of three distinct blocks of building, the eastern part being a farmhouse, with a dwelling-house on the west and two cottages to the north. Not much is known of its early history, but at the beginning of the seventeenth century the house was rebuilt by a certain Giles Broadway, or Giles of Broadway.

The main elevation which faces south has a frontage of 94 feet, broken by three bays and roofed with a range of sharply-pitched gables, six in all, the one on the east being wider than the others, and evidently the older part of the house. The return elevation on the east has a series of small simple dormers along the whole length of the roof. In the centre of the house is a picturesque courtyard, containing a circular fountain, which gives it quite a continental appearance. Internally there are some fine rooms richly panelled, and some good chimneypieces. The best room is the drawing-room on the first floor, which has some good panelling that has not been tampered with, and an elaborate stone chimney-piece with some curious emblematical figures in the upper part, one representing apparently Temperance triumphant over Intemperance. The chimneypieces in the dining-room and hall are richly carved in wood, but appear to have been made up to a certain extent. The one in the dining-room is dated 1614, and bears the initials of the original owner and his wife. The staircase, like others in the district, winds round a square newel wall, and has solid oak treads with a nosing worked on.

On the slope of the hill behind the house on the north side is a small Norman chapel dedicated to St. James. Its origin is interesting, for it appears that the tenants of Postlip, in the early part of the twelfth century, petitioned the Lord of the Manor, William de Solers, to build them a chapel in their immediate neighbourhood, as, owing to the unsettled state of the country during the civil wars, they were afraid to attend their parish church. At the time of the Reformation it was despoiled and allowed to fall into decay, and until twenty years ago was used as a barn. It was restored in 1891, and is now used as a private chapel. It is an interesting Norman building, with a doorway on the south side. Perpendicular windows have been inserted in the west and east ends, but the original Norman windows still remain on the north and south sides, mere narrow slits in the walls with a deep splay inside. Over the chancel wall is a simple stone bell turret, and another interesting feature is a small opening high up in the nave wall on the south side with an external corbel; this was probably intended to hold what is known as the "Poor Soul light," which was a lamp lighted nightly to remind those who passed by and s w it to pray for the souls of the departed. At the foot of the hill to the south-west of the house is an old barn, cruciform on plan, about 96 feet long and 28 feet wide, and the manor house, chapel, and farm buildings form a very picturesque group amidst the surrounding trees. A few miles further along this road is Winchcombe, an ancient town called in Anglo-Saxon times "Wincelcombe," which means "a corner of the valley," a very appropriate name, as it lies at the end of a beautiful valley, almost entirely encircled by the Cotswolds.

In the ninth century Winchcombe was the capital of Mercia and a royal residence, but its importance was chiefly due to the fame of its abbey. King Offa built a nunnery there in 787, and towards the end of the same century his son Cenulph founded a Benedictine abbey on the same site for 300 monks and dedicated it to the Blessed Virgin Mary. At his death he was succeeded by his young son Kenelm, aged seven, who was murdered by order of his sister. Tradition says that the fate of the young king was miraculously revealed in various ways. At any rate, when his body was discovered it was removed to Winchcombe, and the abbey in consequence became popular as a place of pilgrimage, as the relics were credited with working miracles. A famous historian of the period, William of Malmesbury, says "that there was hardly any place in England more venerated." The abbey was partially destroyed by the Danes, and it is believed to have passed into the hands of secular priests, but towards the end of the tenth century it was rebuilt and given back to the Benedictines. Up to the reign of King Canute the town had been a county in itself, but it was then united with Gloucester. The town was made a borough in the reign of Edward the Confessor, and the Domesday Book records that the possessions of the abbey were unusually large, no fewer than nineteen manors being attached to it. The abbey was destroyed by fire in 1151, and rebuilt again in 1239. That it was considered of great importance is confirmed by two facts—first, it was a mitred abbey, and its abbot sat in the House of Lords; and secondly, Edward III. granted it permission to fortify its buildings, a rare privilege and one seldom granted.

On the dissolution of the monasteries the inhabitants, who possessed a parish church, did not trouble about the

Digitized by Google

abbey, which gradually fell into decay and disappeared, and now all traces of it above ground are lost. In the fifteenth and sixteenth centuries the prosperity of the town was evidently on the decline, for Edward IV., and later on Elizabeth, granted it charters for holding fairs in order to relieve the poverty of the inhabitants.

But with the introduction of tobacco in the sixteenth century its prosperity revived for a short time, until crippled and restrained by the Acts of Charles I. and Cromwell.

The parish church was built by Abbot William in 1490. The inhabitants themselves contributed 200*l.*, a large sum in those days, and part of the cost was also defrayed by Ralph Boteler, of Sudeley. It is a fine example of Perpendicular work, and consists of a western tower, nave, aisles and chancel. There is no chancel arch, but the division between the nave and the chancel is marked by screens, and in addition across the nave an upper screen or roof truss. There is a lofty clerestory, which makes the church remarkably well lighted.

The pulpit was originally placed against the centre pier on the north side of the nave. There is a curious Jacobean font, dated 1634, and some elaborate sedilia on the south side of the chancel. In the eighteenth century the altar stood centrally surrounded on four sides by rails, with seats for communicants on the south, east and north sides, an arrangement which also existed at the neighbouring church of Deerhurst.

The church contains some good furniture and some fine silver plate. Externally the chief feature is the western tower, with a good weathercock, said to have been brought from St. Mary Redcliffe, Bristol. The church is also notable for the great grotesque gargoyles, some forty in number, on the parapets and tower.

There are several good seventeenth century houses in the town, the best being a picturesque gabled building known as the "Jacobean House," which stands opposite the church, the detail of the entrance front being particularly good. According to an inscription in Sudeley Church, this house was restored and enlarged by Mr. Wyatt in 1879, who had also restored the church some few years before.

Other interesting houses are the George Inn, which was the resort of the old pilgrims, and is inscribed with the initials "R. K.," Robert Kidderminster, an abbot of the time of Henry VII.; and another inn in the main street called "The Corner Cupboard," a long, low, rambling place on the street approached by a flight of stone steps, semicircular on plan. There is also a simple Georgian house with interesting detail.

About one mile from Winchcombe is Sudeley Castle; the property belonged in the olden times to King Ethelred, and was granted by him to his youngest daughter, the Countess of Goda. In those days its value must have been great, for it included a forest of oaks, covering an area of about six square miles.

The first Lord of Sudeley was Ralph, nephew of King Edward the Confessor, and in later times another owner of Sudeley had for a brother William de Tracey, one of the murderers of Beckett. In 1367 the manor passed to Joan de Sudeley, who married William Boteler.

In the French wars during the reigns of Henry V. and Henry VI. a certain Ralph Boteler took an active part and rebuilt the castle from booty gained in the war; he it was who helped to build the parish church in Winchcombe. His services to the house of Lancaster compelled him to surrender the castle when Edward IV. came to the throne, and it came into the possession of Richard, Duke of Gloucester, who later on exchanged it for Richmond Castle, in Yorkshire. Thus Sudeley reverted to the Crown, and in 1509 the manor was granted to Robert Kidderminster. In the reign of Henry VIII. it is said that the castle was going to ruins. It was granted by Edward VI. to Lord Seymour, who made great preparations there for the reception of his bride, Katherine Parr, and round this lady centres the chief historical interest of the castle, for Katherine, the last wife of Henry VIII., surviving him, married a fourth husband in Thomas Lord Seymour, and a special suite of apartments was prepared for her at the castle.

The Queen's chaplain was the celebrated Miles Coverdale, who revised the Bible at the direction of Henry VIII.

Lady Jane Grey was also a frequent visitor to the castle at this time, as was also Princess Elizabeth, who spent some of her early years there, and afterwards as queen was three times magnificently entertained by Giles, the third Lord Sudeley.

Some time after Seymour's death this property passed to Sir John Brydges, who was given the castle and the title of Lord Chandos, as a reward for his services, by Queen Mary.

In the time of the Civil Wars Sudeley was looked upon as the strongest fortress in the neighbourhood, ranking with Berkeley and Warwick, and as the royal forces occupied Oxford it became of great importance, for it could command all the district between Camden and Cirencester, but it was captured by Colonel Massey in 1643 and given up to the Royalists later on at the fall of Cirencester. It again surrendered to Sir William Waller, who trained his guns on the castle from Dunn's Hill on the east, and the Parliamentary forces, although only 300 yards off, are supposed to have only hit the castle once. Later on Lord Chandos seceded to the Parliament, and the Commonwealth ordered it to be rendered unfit for a military post, and it was accordingly demolished after being garrisoned for five years. From this time nothing much is known of the castle, and at one time it became a public-house. In the early part of the nineteenth century the estate was purchased by John and William Dent, of Worcester, and they set to work to make the castle fit for a country residence.

There are some interesting pieces of furniture in the house, among them the bed of Amy Robsart, from Cumnor Castle—it is peculiar as having a secret panel in the head containing a crucifix—and in another room there is the bedstead and tapestry from Marie Antoinette's bedroom, removed here when sold at the Revolution, and there is also some good Spanish leather in the dining-room, and generally the house is full of interest.

Sudeley must have been one of the finest baronial castles in this part of Gloucestershire. The original house was built in the reign of King Stephen, and rebuilt entirely in Henry VI.'s reign by the famous sea captain, Ralph, Lord Boteler of Sudeley. The ruins of the banqueting hall remain to show what a fine room it must have been, being on the first floor, and approached by a stone newel staircase. The windows at the ends and sides of the hall still remain, and the whole forms a splendid example of late Perpendicular work. The northern quadrangle has been restored by the Dent family, and at the same time the church, which dated from the middle of the fifteenth century, and adjoins the house on the east side, was also restored by Sir Gilbert Scott; it had been very much damaged by the Parliamentary forces in 1643, and had remained in a very neglected state. He also designed the tomb with the recumbent figure which is placed over the remains of Katherine Parr, and contains fragments of the old tomb with the lead coffin inside.

Two miles south of Sudeley Castle is Charlton Abbots, a fine Cotswold building with some later additions; and grouped round the house are the old farm buildings, including a large barn, the whole forming a very picturesque group on the slight slope of a hill. The house has three storeys, and is roofed in a single span running east and west; there are three gables on the south side and two on the north, the projecting portion on this side being evidently an addition; on the eastern side of the building is a two-storeyed square bay with the centre light 6 inches wider than the others.

The most interesting feature internally is the staircase, 5 feet 6 inches wide, carried round a square newel wall of the same dimensions, and off each landing doors lead to the different rooms, the various levels of the different floors making the external elevations particularly interesting. In one of the first-floor rooms, which is panelled and has a segmental ceiling, there is a seventeenth century carved oak chimneypiece, and in all probability the house was originally far richer in panelling than it is at the present day, as it has now been converted into a farmhouse. Near the house is a small church, and it is said that there used to exist in the village a lazar house belonging to the Abbey of Winchcombe, but at the present day no trace of it exists.

Leaving Charlton Abbots and going south another mile along the road is Sevenhampton, or, as it is often called locally, Sennington, which has a manor house with a church adjoining. The latter is a small cruciform building, with a central tower, transepts, and no aisles; the curious feature of the tower is that it is narrower than the nave, and is placed east of the crossing, so that the western piers stand free. These piers have been strengthened by flying buttresses placed diagonally inside the church from the piers of the tower to the corresponding angles of the nave and transepts. The tower, which is lighted by windows above the roofs of the transepts, has a turret staircase on the south-east angle. The porch, which is on the south side, has a good door with a four-centered arch and pierced tracery head.

The dimensions of the church are interesting. The nave is only 13 feet 9 inches wide, and the total length of the church is 84 feet. The internal dimensions of the tower are 10 feet by 9 feet 6 inches. The greater part of the church

Digitized by Google

is fifteenth-century work, but the chancel is earlier, and has single lancet windows on the north and south sides; probably the south porch and the tower were built at the close of the fifteenth century as the result, so a memorial in the church informs us, of the bequest of a certain John Camber, to whose memory a brass has been placed in the chancel bearing the date 1497. The east window is a three-light Perpendicular one, and probably replaced an earlier one of the thirteenth century. Between the north transept and the chancel is a passage which may also have served as a hagioscope, and the stone forming the roof of this passage is believed to have been an old altar stone, as there are traces of crosses on it. In the chancel also there is an old stone shelf which shows the height of the original altar; it is interesting, as it was not usual to raise the altar above the floor level in the early days of the Church.

The manor house, which is to the north-west of the church, is a seventeenth-century building, but it has been very much modernised both internally and externally, and the only old part is the back or eastern side. One of the windows in a room on the attic floor has a stone sill, with a stoup for holy water, and, as in earlier days the house was used as a retreat by the nuns from Sudeley Castle, the room may have been used as a chapel. An interesting feature of the outbuildings is the small four-gabled dovecote over the stables.

Another short walk will bring you to Whittington, which is only about five miles east of Cheltenham, on the Oxford road. The village is particularly picturesque, for most of the cottages have very small square bay windows. The manor house is a typical specimen of the local architecture, but unfortunately the west wing has been pulled down and replaced by modern additions; the north or main elevation has three pointed gables with windows which still retain their original glazing. Like other houses in the neighbourhood, the most interesting feature internally is the open newel staircase, 5 feet 9 inches wide, which goes from basement to attic in a series of flights of seven steps each; at the top of the first flight is a quaint and original dog-gate. The whole staircase shows a prodigal use of timber, for the newels are 7½ inches square, and are continuous, but the turned posts on the top of each newel supporting the one above have been removed, the reason being, so it is said, that sacks of corn might be the more easily carried up and down; the solid strings are 14 inches by 7½ inches, and the hand-rails 6 inches by 6½ inches, with 3½-inch turned balusters. The eastern end of the ground floor originally formed one room. The house contains some good stone chimneypieces, and several of the rooms are panelled. A corner lobby or tambour in one of the bedrooms has an angle pilaster with an Ionic capping treated in a noble but curious manner, for in order to solve the difficulty of the angle volute it is omitted altogether. Close to the house on the east side is the church, so close that at the north-west corner it is only 3 feet off. It is a picturesque though diminutive building, with several traces of Norman work, notably the north doorway, which is now blocked up. It consists of a nave and chancel 12 feet wide, with a south aisle, and a further aisle or chapel on the same side as wide as the nave and separated from it by an arcade. A timber bell turret, with a shingled roof, is placed over the junction of the nave and chancel roofs. In the south aisle are placed three recumbent monumental effigies in stone, which probably date from the early part of the fourteenth century, and are believed to have been brought from another church in the neighbourhood when it was pulled down. The figures are about 7 feet long; one is of a lady, and the other two represent knights, each with their legs crossed; in each case the armorial bearings are the same, and are believed to be those of the Crupe family, who resided at Whittington until the middle of the fourteenth century. In the chancel wall is a fragment of a tomb bearing the same arms. Fragments of very early work and some tiles from the old chancel are carefully preserved in the church, which was restored in 1872. In the churchyard at the east end is the shaft of an old cross.

The church and house were originally surrounded by a moat, traces of which still exist, and on the north-east are some very picturesque farm buildings.

Leaving Whittington and turning to the left off the main road to Chipping Norton, about ten miles off is Upper Slaughter, a small village containing a fine old manor house and a church. The former is a most interesting building, mainly dating from the sixteenth century, but the basement is probably a couple of centuries earlier, and the two-storeyed porch is evidently a later addition. It was formerly the property of the Church, but at the dissolution of the monasteries it passed to the Slaughter family, who rebuilt it and occupied it for about 300 years. They probably derived their name from the place, which in Domesday Book is spelt Sclostre, and the original name of the village may possibly be connected with some bloody victory over the Britons. The house is situated on the edge of a hollow, there being a difference of about 9 feet between the level of the entrance courtyard and the basement: the house is L-shaped in plan, and the entrance front, which faces west, has four gables, the one above the porch being much smaller than the others, while the southern elevation, which has three gables, forms the arm of the L. The eastern or back elevation is perhaps the most picturesque, as the grouping and the design of the chimneys is particularly good. Internally there do not seem to have been any dividing walls, and evidently the house has been considerably altered at various times. In one of the rooms there is some good panelling and a fine stone chimneypiece. The house, which has recently been occupied as a farmhouse, is now being restored.

The church, which is close by, is an interesting structure of transitional Norman work, and consists of a nave, western tower, and a chancel, with a stone bell turret surmounting the gable at the east end of the nave. The tower, which is square on plan and somewhat squat, is embattled and has angle pinnacles, but the upper part is of a later date than the nave. On the south-east of the church is a group of small cottages recently restored by Mr. Lutyens. About two miles east of Upper Slaughter is a new house designed by Mr. Guy Dawber, called Netherswell Manor; it was originally built about five years ago, but it has recently been added to and, in fact, completely remodelled. The stables, farm buildings, kennels and engine-house, and the lay-out of the gardens and terraces have all been most carefully designed by the architect. The house is most beautifully situated and commands some fine views. At present, of course, everything looks rather new, but when our Association visits the same district in another fifteen years or so I am sure that this house, over which architect and client have been so much in sympathy, will form one of the most interesting visits on their programme.

(To be concluded.)

TESTS OF CAST IRON.*

THE very great variations in the tests which have been obtained from cast iron from time to time, and the differences of opinion which exist as to the best methods of testing, determined the author to make the comparative tests which form the subject-matter of this paper. These tests were all carried out in actual foundry practice, the metal used being taken chiefly from the ordinary cylinder mixtures, which remained over and above what was required for the tests used in the ordinary shop work. The object of the tests was in no way to secure the highest possible results, but, if possible, to arrive at the differences in results under varying working conditions.

The author wishes to state his appreciation of the work of T. Turner, W. R. Johnson, West, Keep, and Outerbridge on cast iron. Their results are all of much value in the intricate problems involved in the study of that material.

Tensile Tests.

Nine boxes were used for casting the twenty-four tensile test-bars and six transverse test-bars from the one ladle. The tensile bars numbered 1 to 3 were cast to a diameter of ⅞ inch, Nos. 4 to 6 to a diameter of ¾ inch, Nos. 7 to 9 to a diameter of ⅝ inch, and Nos. 10 to 12 to a diameter of ½ inch. The tensile bars from 13 to 24 inclusive were cast 1 inch diameter, and were machined down to the same diameter as Nos. 1 to 12, and the six transverse test-bars were then cast on edge at an angle of 22½°. Table I. shows the results of the tests obtained, which appear to indicate that the bars which have been machined give better results than those which have been tested as cast with the skin on. The results of the transverse and deflection tests are given later. Twelve tensile test-bars and four transverse test-bars were cast from the same ladle, duplicating tests Nos. 13 to 24, in order to confirm if there were any special diameter of the turned bars which gave the highest results, but from the second part of Table I. it would appear that the bars turned down to ⅝ inch to ½ inch show very little variation in the test per square inch. Five sets of bars—three tensiles and two transverse bars, each with the same percentage of silicon (the latter cast on edge at an angle of 22½°)—were cast from the same

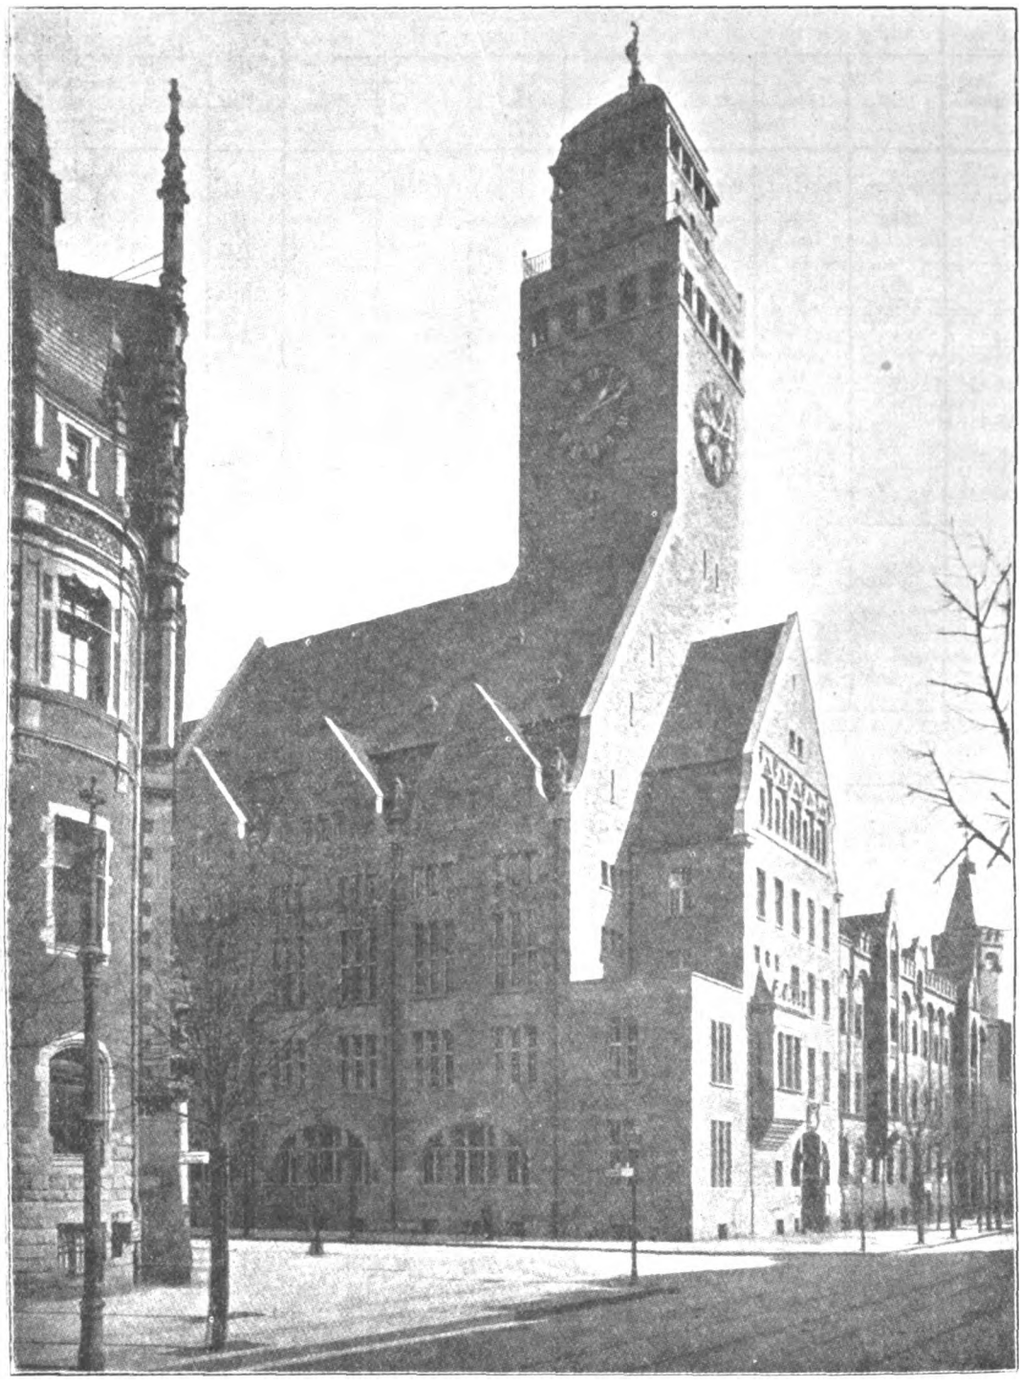
* Slight flaws. † Flaw.



ladle of metal as those entered in Table I., but varying percentages of 50 per cent. ferro-silicon were added to each small ladle (taken from the larger ladle), in order to increase the percentages of silicon in the test-bars. This was duplicated.

Table II. shows the results of these tests, which were made with the idea of ascertaining the value of the use of high percentages of ferro-silicon in actual foundry practice. A number of the tensile tests showed flaws, and as the tests obtained therefrom were in consequence very low, they have not been included, as the true area of the bar could not be obtained. The sound bars were all tested, and the average results taken as the mean of each set of bars. In Table I. the percentages of silicon which were actually added to the metal are shown, together with the increasing percentages of silicon, and it is noticeable that in spite of the silicon being increased from 1.53 to 2 per cent. in the one case, and in the other from 1.3 to 1.86, the combined carbon shows practically no alteration. Further, as the other elements are practically constant, it may be assumed that this table shows the effect of increasing silicon, and whilst the first part of the table presents practically no difference in the average results from bars with from 1.67 to 2 per cent. of silicon, the second part shows a decrease in the strength as the silicon increases. This therefore, does not confirm the results contained in the first part of the table obtained with bars of varying silicon content, and would point to some condition of the iron, apart from the analyses, which has a greater effect on the results of the tests. Also from the fact that the percentage of combined carbon has not been reduced in spite of the addition of one-third more silicon, it would further show that silicon alone is not the only factor in the conversion of combined carbon to graphite. One point is very clear, namely, that with the increase of silicon the crystals of the iron have also increased in size; but these are also affected by the cooling conditions which are independent of the analysis.

NOTES ON BOOKS.

"Cathedral Cities of Spain." Written and illustrated by W. W. Collins, R.I. (London: William Heinemann. 16*s.* net.)

THIS is the book of a painter, but of a painter who has a keen appreciation and an adequate knowledge of architecture, so that although it may be read and enjoyed by the layman, being not so severely technical as to be beyond his comprehension, and although it contains nothing in the way of plan, section, or elevation, it yet gives in the text such excellent word-painting of the architectural features, and in the illustrations, which, by the way, are all in colour, such admirable expression of detail as well as of composition, that it is eminently a book for an architect, who will have no difficulty in realising what is included in the Cathedral architecture of Spain. The severe majesty of the Romanesque work, the almost frivolous luxuriance of the latest Gothic in Europe are alike exhibited and portrayed by the artist-author. It is good for an architect to be able to see architecture, once in a while, through a painter's eyes. It makes him realise how great a part grouping and environment play, how potent is the influence of material along with and not neglecting that of detail in determining the expression of a building. One might expect that as a painter, Mr. Collins would, in his illustrations, put colour in the highest place, particularly in sunny Spain, where colour tells and brilliancy of tint harmonises so completely; but we feel in looking at the illustrations in this book that here we have the presentment of Architecture, that the cathedrals of Spain are not merely charming harmonies of colour, but that colour is but an adjunct to architectural form. Hence we may characterise Mr. Collins's drawings as admirable representations of architecture. And if for the moment we try to free our minds from this dominant impression we can enjoy without stint the feast of colour that is here provided, admir-

DETAIL FROM NEW RATHAUS, RIXDORF. Reinhold Kiehl, Architect.

ably put before us by exquisitely skilful colour-printing of delightful paintings, sixty beautiful pictures for 16*s*.

"The Patent Road to Fortune." By a Successful Traveller on It. (Hull: Burtt Brothers. London: A. Brown & Sons, Ltd. 3*d*.)

An investment of threepence to learn how to become a millionaire seems profitable, and in this little manual the main points of patent procedure are clearly described, and, above all, the useful lesson is inculcated that "the inventor may be the hen that lays the golden egg: it is the capitalist and manufacturer who hatches it." It is easy enough to invent—an architect does it every day of his life—and not difficult to obtain a patent; but it is quite another thing to make a fortune out of a patent, which, after all, is but a peg on which to hang a business, and a successful business cannot be made without capital, energy and commercial instinct.

"Construction, Equipment and Management of a General Hospital." By Donald J. Mackintosh, M.B., M.V.O., Medical Superintendent of the Western Infirmary, Glasgow. (Edinburgh and Glasgow: William Hodge & Co. 10*s*. 6*d*. net.)

This appears to be practically an exposition of the details and methods adopted in the design and equipment of one of our most modern large hospitals, the Western Infirmary of Glasgow, and of the principles that have dictated these details and methods. Whilst, therefore, it represents the views of a medical practitioner of great experience in hospital work, it is almost necessarily a somewhat one-sided treatment of the subject, and lays down the law with great emphasis in regard to many points in hospital construction and equipment as to which there is justifiable difference of opinion. For example, the bathrooms of the ward units illustrated and described open direct into the corridor leading to the ward, close to the door of the ward and immediately facing the door of the ward kitchen, instead of being disconnected as are the w.c.'s and the sink rooms by a cross ventilated lobby. Many hospital men regard, and we think rightly, a lavatory or bath-waste pipe as quite as dangerous to health as a soil pipe. Again, Mr. Mackintosh enjoins, positively, the use of terrazzo for floors, even of an operating theatre, a point on which many experienced surgeons hold quite an opposite opinion. Whilst, therefore, this book gives us an admirable account of what has been done at Glasgow in regard to one General Hospital, it cannot be accepted as a text-book on the construction, equipment, and management of hospitals generally. We should not omit to note that there is included a description and plans of the Nurses' Home at the Hospital for Sick Children, Toronto, which the author describes as "probably the best-equipped Nurses' Home attached to any hospital."

"Building Construction." By Charles F. Mitchell, assisted by George A. Mitchell. Stages 2, 3 and Honours. (Advanced and Honours Courses.) Sixth Edition. (London; B. T. Batsford. 6*s*.)

Mitchell's Building Construction (Advanced), as it has been popularly known, has, since its first appearance, been universally recognised by teachers and students as excellent value for the money, and although the new edition is advanced in price, it is much enlarged and modernised, so that it is now better value than ever. There is, however, still room for improvement. The English natural cements should have been put into the past tense, and a warning given of practically the only natural cement now on the market, Belgian so-called "Portland cement." Fig. 3 would be more easily understood if it were not printed upside down. The weakest part of the book is still that on materials, and it is questionable whether it would not be wiser to omit it, as space does not permit adequate treatment. For example no up-to-date account would ignore Hungarian (Austrian) or Japanese oak, or Tabasco mahogany. The fire-resisting floors described are very antiquated, Fawcett's older form, for instance, being included, and his latest, and, as we think, best, omitted.

"Shipping Marks on Timber." (London: William Rider & Son. 7*s.* 6*d.* net, in cloth; 9*s.* net., in leather.)

It would open the eyes of the architect who still specifies that all the timber required for his buildings shall be "from Memel, Danzig, or Riga," to glance through this book and note the multiplicity of ports and shippers that now send timber to this country, a multiplicity that renders it almost impossible for him even to remember the names, still less to know the marks by which they are distinguished. Hence such a book as this is an absolute necessity to every architect who really wants to know what his client is getting in the way of timber. The value of the book is enhanced by the dual or cross reference system of indexing the marks now used under shippers' names, and under marks alphabetically arranged. This volume should find its place on every architect's office book-shelf alongside of Laxton, the Building Act, and other works, for constant reference.

"Country Life." Vol. xxv. (London: George Newnes, Ltd.)

The half-yearly volumes of *Country Life* always make books of more than ephemeral interest well worthy of a place on a library shelf, if it were only for the valuable series of records of country homes, which has now for so long been a feature of the publication, and which, in the present volume, maintains both the interest and the standard of what has gone before. The houses described and illustrated in the present volume are Apethorpe Hall, Boughton House and Deene Park, in Northamptonshire; Blenheim Palace, in Oxfordshire; Brinsop Court and Holme Lacy, in Herefordshire; Charlton House, in Kent; Coker Court, in Somerset; Cooke's House, West Burton, and Wiston Park, in Sussex; Daneway House and Sudeley Castle, in Gloucestershire; Nevill Holt, in Leicestershire; Parham Old Hall, in Suffolk; Stirling Castle, in Stirlingshire; The Moot, Downton, in Wiltshire.

OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* gives a full account, with illustrations, including plans and details, of the steelwork of the Metropolitan Tower, the highest masonry and steel structure in the world, rising to 700 feet 3 inches above the kerb, and of which Messrs. N. Le Brun & Sons are the architects.

La Construction Moderne, in its series of articles on old Paris, now deals with the chapel of Port Royal and the church of Saint Médard. Illustrations are given of M. Gaston Castel's design for the principal (it would be royal if France were not a republic) box of a theatre, which took the Chaudesaignes Prize at the Académie des Beaux-Arts; of the executed façade premiated in 1908 by the municipality of Buenos Aires, and of a winning competition design for a block of offices for the Ministry of Marine, of which M. Palouillard-Demoriane, a former Prix-de-Rome man, is the author.

Architektur og Dekorativ Kunst has in recent issues given illustrations of the Arts and Crafts Exhibition buildings at Stockholm and of some of the exhibits therein. Several examples of cottage design are also illustrated.

Der Profanbau gives a full account of the work of Hans Grässel, the city architect of Munich, with illustrations of some of the works, especially orphanages and hospitals, that he has carried out. These are not merely utilitarian buildings, but works of architecture.

Architekten und Baumeister Zeitung illustrates another block of flats, of which Rudolf Erdös is the architect and which have been built in the Grüne Torgasse of Vienna.

The *Engineering Record* gives an account of some interesting tests on the waterproofing qualities of alum and soap mixed with concrete or cement mortar. These tests were made by Mr. B. L. Bowling in the cement laboratory of the University of Illinois.

The Leighton House Committee has arranged for Mr Beckwith A. Spencer to give a course of six lectures on "Florentine Painting" in Lord Leighton's studios, 12 Holland Park Road, Kensington, W., at 5 P.M. on successive Fridays, beginning October 29. The first will begin with the consideration of the "Conditions of art in Italy in the thirteenth century and in Greece in the Classic age compared."

COMPETITIONS.

Bath.—The City Council on Tuesday agreed to offer 50*l.* as a premium to the architect who submits the best competitive scheme for the improvement of the Institution Gardens. The Council have no intention of proceeding with any scheme immediately, but they desire to obtain an idea of what ought to be done with the site.

Hull.—Mr. J. W. Simpson, F.R.I.B.A., the assessor in the competition for a college for elementary teachers on the Cottingham Road, submitted his award to the Hull Higher Education Committee on Tuesday. There were seventy-nine architects who competed. The winners of the premiums were as follows:—1st, Messrs. Crouch, Butler & Savage, Birmingham (No. 53). Estimated cost of buildings, 33,350*l.* 2nd, Mr. William H. Thorpe, Leeds (No. 54). Estimated cost of buildings, 41.027*l.* 3rd, Mr. G. H. B. Gould, Ipswich (No. 55). Estimated cost of buildings, 36,207*l.* The committee decided to adopt the design of the winners of the first premium. The premiums offered were 150*l.*, 100*l.*, and 50*l.*

Rotherham.—The education committee last week decided to offer premiums of 50*l.* and 20*l.* in the competition for designs for a higher standard school at Kimberworth. An assessor will be appointed.

GENERAL.

The Annual Dinner of the Norwood Athenæum took place on Wednesday evening in the Caledonian Hall of the Holborn Restaurant. The chair was occupied by Mr. George Thatcher, the President, who was supported by the Rev. Canon Mapleson, I.L.D., Mr. F. Spiers (Secretary), and Mr. Frederick Higgs, the head of the well-known firm of Messrs. F. & H. F. Higgs, the past President. The President announced that several architects had joined the Society recently, and it was hoped that other members of the profession might be induced to follow their example. A very hearty vote of thanks was passed to those members who had read papers before the Society and conducted their Saturday afternoon visits to places of architectural interest.

The Foundation Stone of St. Mark's Church, Purley, was laid on October 23 by the Bishop of Kingston. The church is designed in the Decorated Gothic style. The nave is 25 feet 6 inches wide, 38 feet high and 83 feet long divided into five bays. The chancel is 24 feet 6 inches wide and 38 feet 6 inches long. There are north and south lean-to aisles, 10 feet 3 inches wide, and double transepts, that on the north side forming the nave to an apsidal ended chapel. The vestries are placed on the south side of the chancel, and the organ chamber is formed over the choir vestry. The tower is placed at the junction of the aisle and transept on the north side of the church, and has a copper covered spire rising to a height of 130 feet, the base of the tower forming the principal entrance to the church. The baptistery is placed at the west end, and is flanked on either side by entrance porches. The materials used are Kentish rag stone laid in random courses, with Bath stone dressings externally, and brick-facing with stone dressings internally. The church is being built by Messrs. R. Wilkins & Sons, of Bristol, from the designs of Mr. George H. Fellowes Prynne, F.R.I.B.A., of Westminster.

The Surveyors' Institution have awarded their gold meda for the best paper read at the professional meetings of the past session to Mr. J. G. Head (Fellow) for a paper on "Giant London."

Sir W. B. Richmond, R.A., is to deliver on Tuesday next and the three following days the set of Hermione Lectures annually given at Alexandra College, Dublin. The course will treat of Egyptian, Greek and Byzantine art.

The Court of Common Council in response to a letter from the Dean of St. Paul's asking for the assistance of the Corporation in raising the amount required for the necessary preventive measures to secure the cathedral against fire risks, have made a grant out of the City's cash of 200 guineas.

Mr. J. J. Webster, M.I.C.E., 39 Victoria Street, S.W., has been appointed by the Warrington Town Council to act as assessor in the competition for a new ferro-concrete bridge to be erected over the Mersey. Mr. Webster will also superintend the carrying out of the work. The Town Clerk has been instructed to apply to Parliament for a Bill giving powers to construct the bridge, which is to be 60 or 70 feet wide.

FORTHCOMING EVENTS.

Friday, November 5.

Architectural Association: Paper on "Drainage and Sewage Disposal," by Mr. W. D. Scott-Moncrieff.

Monday, November 8.

Surveyors' Institution: Presidential Address by Mr. Alexander R. Stenning, F.R.I.B.A.

Tuesday, November 9.

Institution of Civil Engineers: Papers on "The Single-Phase Electrification of the Heysham, Morecambe and Lancaster Branch of the Midland Railway," by Messrs. J. Dalziel and J. Savers; and on "The Equipment and Working Results of the Mersey Railway under Steam and Electric Traction," by Mr. J. Shaw.

Wednesday, November 10.

Manchester Society of Architects: Paper on "Practical and Theoretical Training," by Mr. R. W. Schultz.

Northern Architectural Association: Opening Address by the President, Mr. G. T. Brown, F.R.I.B.A.

Royal Sanitary Institute: Discussion on "The Quality of Effluents in Relation to Standards," to be opened by Mr. Gilbert J. Fowler, D.Sc., F.I.C.

COMPETITION DRAWINGS FOR TRAINING COLLEGE, HULL.

THE competition for the proposed college for the training of teachers for elementary schools to be built by the City of Hull Education Committee brought designs from seventy-nine architects, and a very considerable proportion of these designs are excellent; but the Education Committee started from false premises, and imagined that a properly equipped training college for 150 students could be built for something between 25,000*l.* and 30,000*l.*, and without giving competitors an idea of the sum they expected to spend, they had prepared for them a scheme and list of requirements of a truly formidable and comprehensive character, leaving it to the competing architects to say how much it would cost.

This was hardly fair on the competitors, who ought to have been told by the Committee, "We do not want to spend more than 30,000*l.*; give us the best you can for the money." Those competitors who watched the local papers, or otherwise got the information that 31,000*l.* was the assessor's estimate of what the college could be built for, or that the Committee's idea was nearer 25,000*l.*, tried to keep down to that figure. The conditions gave the hint that economy was desirable and that the buildings must be such as not to cost more than 7*d.* a foot cube; but we should like to see—and criticise—the design that Mr. SIMPSON, the assessor, would produce to give the accommodation demanded for 31,000*l.* at 7*d.* a foot cube. We think it could be done—by making most of the rooms 8 feet high, paring down the area of everything not stipulated to the barest possible figure, and using plenty of flat roofs. But the result would not be a first-class training college.

We have not examined all the seventy-nine reports, but we have looked at all those accompanying designs that we think are worthy of execution, and have come to the conclusion that of these the selected design is the cheapest possible; but we are sure that Messrs. CROUCH, BUTLER & SAVAGE must have had a hard struggle with their better feelings before they cut down as they have done their design to the form it now possesses, and they must also feel that if they could spend another 5,000*l.* or 10,000*l.* they could produce a training college more worthy of the city of Hull.

As in the particulars of the competition areas of rooms were not suggested save in a very few instances, it is in this direction that the designs principally vary. For example, the assembly or central hall in the winning design is 68 feet 3 inches by 30 feet, in the second premiated design 80 feet by 44 feet. Which is right? If the college is to be built for anything near the 31,000*l.* it is clear that the figures settled by Messrs. CROUCH, BUTLER & SAVAGE cannot be exceeded. Now, this hall is not for teaching 150 students, but for examining them as to their qualifications for filling posts as teachers, for doing their life's work. There is no competition in these examinations; they are not Civil Service examinations; it is the whole 150 students against the examiners, and it is vitally necessary to the efficiency of the college and the standard of teachers it sends out that there shall be no "cribbing" at the examinations. Now with the dimensions to which the inadequate expenditure limits the authors of the selected design no amount of "bull-dogs" will prevent cribbing, and we consider that the size of Mr. THORPE'S hall is the least that is permissible. But it can't be done for the money.

We think that Mr. SIMPSON, in advising the Education Committee, as he is reported to have done, that the college they ought to have can be built for 31,000*l.* has made a grievous mistake. If they want a cheap and inefficient college, certainly they can get it for the sum mentioned, but it will not be a model for other education authorities to follow. From the competitors' point of view, a great many clever men have wasted time and money because they were not told that the Education Committee of the City of Hull wanted a cheap article in preference to a good one.

The college will consist, according to the conditions, of various units—(A) hostel for 50 men students, (B) hostel for 100 women students, (C) hall and lecture rooms, (D) refectory and kitchens, (E) Principal's house, (F) gymnasium, (G) porter's lodge and entrance gates.

In the first premiated and selected design, by Messrs. CROUCH, BUTLER & SAVAGE, the principle has been adopted of arranging the various units in a series of separate blocks connected by covered ways. The whole are grouped very compactly in the southern part of the site, and thus leave a large area free for playing fields. In units A and B, the hostels for men and women respectively, the preparation room and recreation room, each 30 feet by 20 feet, and also the latrines and cloak room, boot-changing and cleaning rooms, and bicycle store are one storey buildings only, with flat roofs, thus simplifying the problem of providing the study-bedrooms and other accommodation in an easy and symmetrical manner. The difficulty in this connection presented by the isolation rooms for sickness is obviated by placing these on the third floor. Thus the hostels are three storeys high, with a fourth storey in parts. Practically all the study-bedrooms on the second floor are in the roof.

In unit C the central hall is 68 feet 3 inches by 30 feet, and on the ground floor has rooms all round it, the light being obtained over the art room, which is 20 feet by 50 feet, but only 12 feet high, and flanks the north side of the central hall. The authors have given rather more than was asked for as regards class-rooms, providing two for fifteen students instead of twelve as required by the instructions.

Digitized by Google

ETCHINGHAM CHURCH, SUSSEX.—From a sketch by BANISTER FLETCHER.

The science class-rooms are on the first floor, where also are placed the common rooms for male and female staff, vice-principal, and master of method, and the sick-room. The greenhouse adjoins the chemistry laboratory, but is thus on a different floor and a long way from the art room.

Unit D is well and compactly planned, the refectory being the same size as the central hall, 68 feet 3 inches by 30 feet, but the lighting of this and of the servants' dormitories over does not seem to us to be quite as good as might be desired.

Unit E, the Principal's house, is economically planned, but the rooms are small, and two of the bedrooms are veritable attics in the roof.

In unit F the gymnasium is 50 feet by 20 feet, and with a verandah 8 feet wide forms the sports pavilion. The manual instruction room is 35 feet by 20 feet, and the changing rooms are each 13 feet 6 inches by 17 feet. The fives courts are of the Eton pattern.

The external treatment is a quite modern and severely restrained red brick building with stone dressings and green slate roofs. The authors' estimate at the figures suggested in the conditions is 33,350*l*., but they think their design could be carried out for 30,000*l*., and we agree with them, provided they are allowed to skin their specification as they have squeezed the accommodation.

The second premiated design, by Mr. WILLIAM H. THORPE, also adopts the principle of detached blocks connected by covered ways, but the blocks are larger on plan in themselves and are disposed so as to occupy more space on the site. In units A and B the hostels are three-storey buildings, and the preparation room and recreation room have study-bedrooms over them, thus necessitating a compromise on the ground floor between the desirable height of study-bedrooms and of the larger rooms. Whereas Messrs. CROUCH, BUTLER & SAVAGE make the height of the smaller rooms uniformly 9 feet 3 inches and that of the larger rooms 11 feet, Mr. THORPE has felt constrained to make the height of his ground floor 10 feet throughout. Apart from this, the space provided by Mr. THORPE for various parts is greater than that in the selected design. Coming to unit C, the hall and lecture rooms, we think Mr. THORPE's plan is markedly superior to that of the selected design, even though the art room has windows on the east side and one at the south end in addition to the principal windows at the north end. The relative amount of space provided may be gleaned from the dimensions of Mr. THORPE's central hall, 80 feet by 44 feet, and the remainder of the accommodation is on a similar scale. In unit D we find the same story. Mr. THORPE's dining-hall is 74 feet 6 inches by 32 feet; his kitchen 30 feet by 20 feet, as against 20 feet by 20 feet in the selected design; in fact, throughout, Mr. THORPE's plan for this unit is better than that of the victors, but more expensive. So also with unit E, the Principal's house. In unit F, the gymnasium and sports pavilion, we do not think that Mr. THORPE's plan is superior, although it gives more accommodation and is, therefore, more expensive. Mr. THORPE proposed to carry out his design in red brick, with Ancaster stone dressings and grey Burlington slates. His external treatment is, we think, more dignified and suitable than that of the selected design. In fact, we may very well presume that, if cost were not a vital element in the decision, the position of the first and second premiated designs would have been reversed. Mr. THORPE estimates the cost of his design at 7*d*. per foot cube at 42,647*l*., but thinks it could be brought down to 35,207*l*. We think many of the competitors have misread the assessor's instructions on the point of price. We understand him to mean, "You must not make a design that will cost more than 7*d*. a foot cube," not "You must price your design at 7*d*." At Grimsby, we remember, some of the competitors were going to build for 4*d*., and Grimsby is not far from Hull.

The third premiated design, by Mr. G. H. B. GOULD, differs somewhat in type from the first and second in that the hostels immediately adjoin the refectory block, and the only corridors or covered ways are those to the assembly hall and lecture rooms. There is a nice sense of effective internal planning and a largeness of treatment with generosity of space that makes this plan very attractive, and without undue expense a quite collegiate feeling is given to the external treatment by a Tudoresque cachet. The author estimates the cost of his design at 36,207*l*., but he has cubed units A, B, and E at 6½*d*., units C, D, and G at 6*d*., and unit F and covered ways at 5*d*., instead of the figures adopted by the authors of the first and second premiated designs. This figure should therefore be com-

Digitized by Google

pared with the first at 30,000*l.* and the second at 35,207*l.* There is not the slightest doubt in our mind that, putting on one side the question of cost for the moment, both the second and third premiated designs are superior to that selected; but, on the other hand, there is not another design in the room which at 30,000*l.*, or something near it, is equal to that of Messrs. CROUCH, BUTLER & SAVAGE. We are quite aware that it may be said with truth that students in this training college are not of the same class as undergraduates at Oxford or Cambridge, that they will become school-teachers at quite moderate salaries, and ought not to be led in their college life to become accustomed to luxuries that will be beyond their reach when they leave "coll." Our answer to this is that the scheme as outlined in the competition conditions embraces many features that might be omitted; and, therefore, to keep within the mark, adequate provision for necessaries is cut down. We fancy that we could take Mr. THORPE's or Mr. GOULD's plan, and by omitting superfluities leave the necessaries as ample as they have provided them without exceeding the expenditure of 25,000*l.*

Of the designs that have not obtained a premium, there are many that are worthy of notice. No. 50 is a very good design, and cubes out at 32,461*l.* No. 62 is also very good with the preparation and recreation rooms of one storey only, but the price, 45,855*l.*, is prohibitive, and as the group of buildings is rather wide it is set somewhat far back on the site and thus reduces the size of the playing fields. Another very good design, which also occupies rather a large proportion of the site, is No. 13; and here again 41,273*l.* puts it out of the running. Very fine designs are No. 17 and No. 20, but their cost would be 49,567*l.* and 54,222*l.* respectively.

Some of the competitors have gone in for big towers, and generally these are part of good, though expensive, designs, amongst them being No. 2 at 45,405*l.*, No. 4 at 49,062*l.*, and No. 25 at 43,294*l.* Pretty grouping of the various units on the block plan is the point to which others of the competitors have directed their attention, such as No. 21, No. 33, No. 49, and No. 63, the latter being quite a good design with preparation and recreation rooms, one storey only, and estimated at 37,120*l.*, but marred by a kitchen department in the basement, which for this particular site was a thing to be avoided. Of the remaining designs which we noted as in one way or other showing excellence are Nos. 9, 14, 15, 18, 19, 22, 23, 24, 26, 27, 40, 56, 57, 65, 68, and 70. Thus more than one-third of the designs exhibited are, barring the question of cost, quite worthy of erection, so that the city of Hull may feel certain that its invitation to compete has met with a very good response from capable architects.

PERMITS TO PHOTOGRAPH.

THE article which appeared in the *Times* on this subject brought a letter from the Dean of PETERBOROUGH, pointing out that the information given in the article was incorrect as regarded his cathedral at least. We have, therefore, made special inquiries as to the regulations regarding permission to photograph, sketch, or measure in our cathedrals, and the following particulars may be taken as authentic:—

BRISTOL.—Permits to photograph and sketch given by the Dean. No charge.

CARLISLE.—Permits to photograph, sketch, or measure given by the Dean "on certain necessary conditions."

CHESTER.—Permits to photograph or sketch at the discretion of the Dean on written application, with name and address. No charge except sixpence for entry to choir or lady chapel.

CHICHESTER.—Permission to photograph, sketch, or measure to be obtained from the Dean and Chapter on application to the Chapter Clerk and payment of half-a-crown. A copy of every photograph taken to be sent to the Chapter Clerk.

DURHAM.—Permits to photograph, measure, or draw given by the Dean. No charge.

ELY.—Permission to photograph, sketch, or measure granted to proper applicants for such parts of the Cathedral and precincts as are ordinarily accessible to visitors. Application to be made to the Dean or the Canon in residence. No charge at present, but question of a moderate fee is under consideration.

EXETER.—Permits to photograph, sketch, or measure given by the Dean or Canon in residence, under certain regulations which the verger communicates. No charge.

LICHFIELD.—Permits to photograph, sketch, or measure can be obtained on application to the Canon in residence. The use of ladders not allowed, nor the removal of any article of furniture. Regulations now under consideration by the Dean and Chapter, and may possibly be revised.

LINCOLN.—Permits to photograph, sketch, and measure granted for four weeks, and if elsewhere than in the nave for a single payment of sixpence. Special permission required for the higher storeys, and applicant must be accompanied by a workman of the cathedral, for whose time a fee will be charged.

MANCHESTER.—Photographing not allowed. Permits granted for sketching or rubbing brasses on payment of a small fee. Photographs can be bought at a cheap rate, the Dean and Chapter having employed a professional firm "to make a series of beautiful photographs, bringing out all that is best to be seen in the cathedral."

NEWCASTLE-ON-TYNE.—Permission for photographing or sketching to be obtained from the Vicar or the Canon in residence.

OXFORD.—Permission to photograph, sketch, or measure must be obtained from the Dean, or, in his absence, from the Canon in residence.

PETERBOROUGH.—Permits are not required, "except that in the case of elaborate measurements, involving perhaps extra labour or responsibility on the part of the vergers, it might be necessary to make special arrangements."

ROCHESTER.—Permits to photograph, sketch, or measure granted by the Dean on written or personal application. A fee of sixpence charged, unless a series of visits is contemplated, when the fee is somewhat modified.

ST. ALBANS.—Permits granted by the Dean, name and address of applicant being required. No fee charged. Holder must "conform to the necessary regulations."

ST. ASAPH.—Permission to photograph and sketch granted by the Dean on application. No charge.

ST. DAVIDS.—Permits for photographing or sketching are granted by the Dean. Fee for one day, one shilling; for one week, half-a-crown. Permission to take measurements is very rarely asked for, and would involve special consideration.

ST. PAUL'S.—Fee of half-a-crown charged for each day's leave to photograph (except in special cases). No flash-light allowed.

SALISBURY.—Permission to photograph, sketch, or measure given to all by the Dean or Canon in residence on application.

SOUTHWARK.—Tickets of permission to photograph, sketch, &c., are obtainable of the Dean's verger at five shillings each.

TRURO.—Permission to photograph given on application, usually by letter, to the Canon in residence. Fee of half-a-crown charged.

WELLS.—Permission given on written application to the Dean or Canon in residence for photographing or sketching, and (in the case of architects) for measuring, without any charge up to the present; but it is not improbable that a small charge may be soon made.

WESTMINSTER ABBEY.—Permission to take photographs is only granted by the Dean in exceptional cases on application to the Chapter Clerk. A fee is paid to the Fabric Fund of five shillings for each view or object photographed within the church.

WINCHESTER.—Permission to sketch or take measurements given on application without charge. Photographers are charged one shilling a day, or half-a-crown a week.

Digitized by Google

WORCESTER.—Permission to photograph given on application to the Dean or Canon in residence. The use of ladders or other apparatus of that kind would be specially considered as to its reasonability.

YORK.—On application to the Chapter Clerk a permit to photograph is given on payment of fee of half-a-crown for one day; to sketch, measure, or take a rubbing, one shilling. For a period of several days or weeks on special work, special terms are arranged for those who can produce satisfactory references. For the choir, lady chapel, chapter-house, crypt, or any part shut off by gates, an additional charge is made of sixpence. The crypts are electrically lighted, and a small extra is charged for this sometimes. Access to the triforium and the use of ladders and stands allowed only under supervision by the clerk of works.

It is hardly necessary to say that photographing, sketching, and measuring are not allowed in cathedrals on Sunday or during Divine Service, that artificial light is usually forbidden, and the use of ladders or stands or the moving of any article of furniture are only allowed by special permission and under the personal supervision of the clerk of works or other official. It will be gathered from the detailed particulars we give above that great freedom is allowed in our cathedrals to those who wish to study; that the regulations made and the fees charged, where these are in force, are for the purpose of maintaining the decency of the church and of preventing the abuse of the privileges that are granted.

NOTES AND COMMENTS.

THE opinions of counsel which have been obtained by the action of 83 architects who took part in the Middlesbrough Library Competition, and who were grievously dissatisfied with the award of Mr. J. S. GIBSON on the ground that the successful competitors violated the conditions of the competition, may be taken to determine two distinct questions:—First, that, in the opinion of a learned counsel accustomed to weigh carefully the exact meaning of words and sentences, the conditions of the competition were not violated in any important point; second, that even if they had been so violated, the competitors would have had no redress or appeal from the decision of the assessor.

MR. BRACKENBURY'S advice, we think, is thoroughly sound: that the conditions and instructions of competitions ought to be so carefully and completely prepared and worded that there should be no necessity for supplementary replies to questions. We fear, however, that it will be a very long time before such an ideal set of conditions and instructions is furnished in any British competition.

THAT competitors should have no legal redress in the event of a faulty award by an assessor has always to us appeared to be an unanswerable argument in favour of the adoption of the jury system of deciding competitions, as universally followed on the Continent. This is not the first time that an assessor has been supposed to make a faulty award, and with even greater and less doubtful grounds than at Middlesbrough. We are not prepared to say that the jury system always results in a correct award, but there is the eminent probability that such will result from the combined wisdom of a number of judges.

THE jury system, for obvious reasons, makes slow progress in favour in this country, particularly amongst those from whom our assessors are chosen. It seems, therefore, that the only course now open to those architects who take part in competitions is, first of all, to protest against the nomination by the President of the Royal Institute of any architect as assessor whom they cannot trust to make a correct award; second, to insist on the name of the assessor being announced before the drawings are prepared; and, third, to abstain from competing when they cannot feel that justice will be done by the particular assessor appointed.

THE discussion on the authorship of the wax bust recently purchased for the Kaiser Friedrich Museum by Dr. BODE is a highly amusing commentary on the value of "old masters." If the bust is by LEONARDO DA VINCI it is supposed to be cheap at 8,000*l*. If it is the work of Mr. R. C. LUCAS it is not worth as many pence. Yet it is as much a consummate work of art in one case as in the other. R. C. LUCAS was undoubtedly a man of great ability, we may even say genius, but it was unrecognised genius, unrecognised, that is to say, by the dealers, save his employer BUCHANAN. There is no probability of there being a replica of this bust if it is the work of LUCAS any more than if it be that of LEONARDO. LUCAS'S works are probably not more numerous than DA VINCI'S. Thus the whole value of this bust lies not in its intrinsic merit, but in the accident that it is thought by some to be the work of one man rather than of another, and that the presumed author is an artist whom the dealers have thought worthy of booming.

THE General Purposes Committee of the London County Council have come to a decision to recommend that the separate existence of an architectural department for education shall cease on the retirement of Mr. T. J. BAILEY at the end of this year, and that as from January 1, 1910, the educational architectural work be placed under the charge of the architect, and that the staff of the department of the architect (education) be transferred on that date to the department of the architect. The meaning of all this is, we take it, that the Council is very well satisfied with the work of Mr. RILEY as chief of its architectural staff, and that his system of organisation and control is a satisfactory one. Although some sections of the architect's department have less to do now than formerly, it cannot be supposed that Mr. RILEY personally has not quite enough to do without being bothered about schools, but his employers evidently think that he is the man to see that some one else builds schools properly. We congratulate Mr. RILEY.

PAGEANTS do some good beyond their ephemeral teaching of history when the profits are devoted to permanent objects, and the course adopted at Liverpool of devoting the balance from their successful pageant to the pictorial embellishment of the town hall is one that is worthy to be followed. The decorative paintings by Mr. AMSCHEWITZ are now ready, and will shortly be placed in position.

WE have received an interesting appeal from the Rev. CHARLES E. LAING, vicar of Bardney, Lincoln, for funds to complete the excavations of the great Benedictine Abbey of St. Peter, St. Paul and St. Oswald. The church is 254 feet long and 61 feet 6 inches wide, with north transept and two side chapels forming a south transept. The chancel was entirely Norman and had four bays; the nave appears from the photographs of the bases of piers to have been Early English and had nine bays. Six only of the piers have as yet been uncovered. The site of the monastic buildings appears to be well defined, but work on their excavation has only just begun.

KINGSTON Bridge is one of the few over the Thames that can be considered beautiful or even sightly, and it is therefore disquieting to know that Mr. BASIL MOTT in his report to the joint committee of the County Councils of Surrey and Middlesex, whilst estimating the cost of widening at 62,000*l*., expresses the opinion that "any attempt to widen must be accompanied by considerable risk to the existing structure," and advocates the building of a new bridge of three elliptical arches of Cornish granite and blue Staffordshire brick, to cost 111,250*l*. Mr. MOTT suggests as an alternative that the present bridge might be left and a new one of less expensive character be erected nearer the railway bridge, and this we think the best of his alternative suggestions.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening meeting of the session of the Royal Institute of British Architects was held on Monday evening last at Conduit Street, W., Mr. Ernest George (President) in the chair.

Mr. H. T. HARE announced the decease of the following members:—Nathan Solomon Joseph, Associate 1863, Fellow 1890; Frederick Hyde Pownall, Associate 1857, Fellow 1860; Henry Stock, Fellow 1885; Don Jose Urioste, of Velada, Hon. Corresponding Member, Madrid, elected 1905; Frederick H. Williams, Associate 1878; John Wornham Penfold, Associate 1860, Fellow 1881; John Archibald Campbell, Fellow 1906; William Owen, Associate 1879; Auguste Choisy, Hon. Corresponding Member and Royal Gold Medallist 1904; and Charles Follen McKim, Hon. Corresponding Member and Royal Gold Medallist 1903.

The SECRETARY said two candidates had passed the recent statutory examination held by the Institute under the London Building Act, Mr. Baxter Greig and Mr. John Hatton Markham, and they had been awarded by the Council a certificate of competency to act as district surveyors in London. Mr. Reginald Guy Kirkby had been awarded a certificate of competency to act as building surveyor under the local authorities

President's Address.

The PRESIDENT then delivered the opening address. He said:—We meet to-night at the opening of the seventy-fifth session of our Royal Institute, and it has been the custom on such first nights for the President to make his oration, and you listened with courteous patience a year ago to my expression of sentiments and views about architecture and the concerns of our calling. My words to-night shall be few, for, happily, we have a more distinct interest in gathering here, perhaps overcrowding our room. Our numbers and our needs have outgrown the accommodation. It is a satisfaction to be able to state that after a few months we shall be suitably housed, spreading into the adjoining galleries that we have long coveted and in which will be our lecture theatre. This library will no longer be deranged for sessional meetings. The pictures, our precious possessions, which are now skied and which are deteriorating in the upper region of exhausted air, will be hung in a becoming light, doing justice to their distinguished painters and to our past Presidents. Our collection will shortly be made richer by the fine portrait of our late President from the hands of Mr. Cope. We shall be able to receive our guests with comfort and propriety without the present struggle for tea and toast. Also we shall have room for the exhibition, under our own roof, of the studentship drawings and of other collections that may be desirable from time to time.

In our art we do not make history so rapidly that there is a new story to be told each year. Progress, I believe, is steadily making—the result of sound training in our schools and of a truer appreciation among ourselves of the principles of building and design. There is a growing desire for breadth and largeness of treatment rather than for petty detail and the trivialities that once interested architects and their public.

We must report l'Art Nouveau as already in a moribund state, and happily we have not been startled by a later invention. We are seldom asked now why architects do not originate a style. Those who have followed the history of the art know that each style, seeming distinct, has been the result of growth, changes coming by degrees, sometimes by assimilation of foreign forms, as well as in variations of detail at the hands of the cunning craftsman, who yet held to the traditions in which he moved.

Such changes have at times been accelerated, as when the influence of the revived Greek and Roman art spread through northern Europe, and men of genius made new melodies on the old chords. Yet the giants of those days did not claim to have invented styles. To meet constantly changing requirements and to accept new methods of building, evolving new modes of treatment will give vitality to modern work which must not resuscitate old models. I give my humble opinion that the average work of architects now is better than it was even several years back, one advantage being that there is less diversity and a more general acceptance of a common style. There is the desire to fall into line rather than for strong self-assertion. Forty years ago, if we had a street frontage to deal with, a first thought was "Shall it be Gothic or Classic?" Now the feeling is that it should harmonise with its surroundings; better than the latter if possible, but not with a clash or discord.

For the carrying out of our work we have in this country admirable builders, and I am glad to state my experience in this matter. We have also the British workman, who is often spoken of slightingly, and perhaps with justice when known only through the demagogues who are too often his mouthpiece. We have craftsmen and workmen equal to the best. For these to have any independence and strength it was found necessary to combine and form unions, and these have been helpful in preserving the man's rights. We have, however, to lament the short-sighted policy of these unions in suppressing the individuality and self-reliance of the man. The intelligent mechanic, with skill and energy, must receive no higher wage than the wastrel; he must not work an hour longer, nor must he do more work in the hour. He is robbed of all ambition and of the possibility of improving his status. Our politicians on both sides of the House avoid this home truth, and discuss other ways of making our workers compete with skilled and industrious toilers in other countries. They do not say that the law the man makes for himself stultifies him and excludes him from the labour market. These artificial conditions of labour have also made the housing of the working man almost impossibly costly.

The future of our art is in the hands of the young men now in our offices, or in the good schools where a training is given much more thorough than could be had a generation ago. We are able to take stock of these future architects annually at the gathering of students' drawings in competition for our medals and prizes. The work shown last winter perhaps exceeded in quantity and quality the product of previous years.

An effort is being made to give direction to the studies of those who go out with our awards, so that time may be spent to the best advantage among the great examples; precious time has sometimes been wasted in miscellaneous and objectless sketching for want of a defined purpose in travel.

One of the aims that we have before us is the founding of a British Architectural School of Rome, the presentation to which would be our highest academic prize, and I am glad to say that this scheme has ceased to be in the clouds. Time and thought have been given to the subject, and much information gathered. A special committee has struggled with the problem, and our able friend Mr. John Simpson has drawn up a practical working basis for our consideration.

It has further been proposed by Sir Brumwell Thomas that we should have a "Diploma School"—a school where architectural study would be carried further than in the ordinary course of training or apprenticeship, and on men from this higher grade our "Prix de Rome" would be conferred; this would be equivalent to a prize Fellowship, giving leisure for higher culture.

It has but lately been realised how important is the study of civic design and town planning. It does not fall to our lot in the old country to scheme new cities on noble lines. We have, nevertheless, most of us seen familiar places change their aspect by degrees, often with lamentable result. There is now a general desire that new quarters of the town and new streets shall not come haphazard and by accident, but shall be the result of forethought, and part of a comprehensive plan with consideration of possible future needs. Architectural effect is to be studied as well as convenience and economy.

These matters have been till now left to surveyors and engineers. The study of such important problems will in future be brought before our architectural students, and, by the generosity of Mr. Lever, the Liverpool University is the first to enjoy a professorial chair for this special study.

A group of able men among our Institute members form a committee for the study and elucidation of this subject, and we have had the advantage of addresses here and of essays in our journal and elsewhere giving the results of their research. This committee is also considering the proposal to organise a conference of those interested in the work of town planning.

We are glad to realise that something has been done to reform suburban life from its monotonous environment. "Port Sunlight" perhaps was the earliest effort to supersede the usual rows of machine-made workmen's dwellings by groups of cottages with character and individuality, these having their outlook on a garden or green instead of always on the street.

The Garden Suburb at Golder's Green, Hampstead, is another happy growth on somewhat similar lines. It has been laid out with skill and judgment, the several roads or vistas taking advantage of any points of interest in the view. Ugly "backs" are avoided, the cottages being made seemly all round. There are dwellings for workmen, also accommodation suited to clerks, while there are larger houses for those of larger means. The desire has been to avoid an unrelieved and dreary aggregation of one class.

Digitized by Google

Another oasis, in a district with no natural attraction, is formed by a gathering of suburban villas, built by Mr. Willett, to the north of Regent's Park. These are by various architects, and they are happily grouped in relation one to another; instead of fences their forecourts or front gardens are enclosed by neatly clipped yew hedges, outside which is a well-shorn grass margin to the road, and this is not harmed by traffic or the passer-by. Looking from these houses or at them the aspect is pleasant with an air of the country and of Kate Greenaway; we wish every success to such speculative building.

We have seen changes come, mostly for the better, in our own great city, while probably greater alterations must follow. Let us prepare for these.

Between the City and Southwark is to be a new "St. Paul's Bridge." This is a matter of vital interest, and we trust that with collective wisdom and good judgment we may have a fine architectural feature, with well studied approaches. Is there any reason why a Thames bridge built now should have less dignity and propriety than London Bridge and Waterloo Bridge? Is there not a shoddy and commercial appearance about most of the later attempts to span the river—a lack of monumental fitness? The bridges of a great city are the features that most impress the mind and remain on the memory.

While speaking of the City I would refer to the Guildhall, with its record reaching back to the days of Henry IV. The interesting crypt and the masonry of the walls remains, but generations of pottering have left little else. Even the late front by Dance has been mutilated. To meet modern wants great changes and rearrangements are to be made shortly, and we trust the best advice and the best possible scheme will be secured for this work. There is also a minor project for building kitchens, &c., now, to the disfigurement of the building, without reference to the future scheme. We would beg the Corporation to defer this work until they have decided on a comprehensive plan. Such halls are of national —I might say international—interest considering their wide hospitality. Some of my friends here will remember how the Burgomaster of Vienna last year, at the Architectural Congress, feasted a thousand of us in the Great Hall of the Rathaus.

In England we get fewer opportunities for architecture on a grand scale than is afforded in other countries. With our Continental neighbours a provincial railway station is made an occasion for an architectural feature; with us we demand only a restricted amount of accommodation and of convenience. The work of a post office is carried on perhaps in half of a grocer's shop, while in a French town the Bureau de Postes would house its officials in a structure with some magnificence.

Just now interest is taken in a scheme for a Playhouse as a fitting memorial to our great dramatist. I hope this may be realised on a dignified scale.

It is strange that while music and musicians have encouraging support here we cannot have an Opera House adequate to our important city. It is not in us to emulate Paris with its Place de l'Opéra, where architects, sculptors, and painters have enjoyed a free hand. Here the State is not expected to help in embellishments of the capital. Great demands are made upon her just now, but the desire is rather that she should take a grandmotherly interest in our private and domestic affairs.

We must accept the fact that expenditure on Art and objects of beauty must generally be the result of private munificence, and it has been gratifying to see how large sums have been forthcoming when a picture has had to be secured for the nation. In time we may find that architecture is appreciated as one of the great factors influencing the lives of the people. The cost of five Old Masters (at the present artificially inflated state of the market) would provide a noble building in which Drama or the Muse should be housed, receiving tributes from sculptor and painter. I do not undervalue the great works of great men, but I do feel that they are sometimes secured at an exaggerated cost, while the cheapening process is applied to public buildings and works that might have an exalting influence. The latter are the common property of all and belong to the poorest among us; they are possessions which we all enjoy and which cannot be catalogued in the impending Domesday Book.

Many of you may feel, as I do, the call from time to time to see something beautiful; perhaps, with a few days' leisure, to look upon the marble palaces and shrines of Venice. Entering St. Mark's we exult in the tenderness, the mystery, and the richness of that temple. As we see the poor crowding around, whose shoulders and knees have polished the stones, we may almost envy them having this constant possession. My argument is that fine architecture is the least selfish or "classy" of human products: it is for all sorts and conditions of men.

We often hear the complaint that architecture is not duly represented in the one small room allotted to it at Burlington House; but we are now, I hope, to be given our chance. We have proposed to the Council of the Royal Academy the arrangement in the winter months of an exhibition of Architecture and the contributory Arts. The Council has graciously entertained the idea of such a scheme for the winter of next year. It behoves us all to make strenuous efforts for a gathering of works and objects that shall interest the outside world in our art.

Besides perspective views, commonly seen, it is desired to have models, such portions of buildings as are portable, sculptured panels, decorative paintings, and, perhaps, metal gates or grilles, with detail drawings or photographs showing the relation of these works to their respective buildings.

The work of giving a higher organisation to the profession of Architecture through the medium of the Royal Institute is making steady progress. Two and a half years ago we adopted a comprehensive policy by a unanimous vote. Step by step we are carrying out that policy. We have drawn up and obtained the Royal sanction to a new Charter. We have drawn up new by-laws after a minute and exhausting discussion, and they are now awaiting the approval of the Privy Council. By the beginning of next year we hope to receive this approval, which will empower us to open the gates of the Institute for the space of one year for the admission of the large number of practising architects of good standing who are still unattached to our body. When that has been done with success we may claim that we represent practically the whole of the architectural profession in this country; we are then to ask Parliament for higher powers and a more secure position. It is our hope that the energies and the good will of all will be united to carry through this policy to ultimate success.

Presentation of the Royal Gold Medal to Dr. Arthur Evans.

While most of us are occupied with our personal aims and interests, seeking our own profit or advancement, with some consideration for the greatness of our Art and perhaps equal consideration for the necessary daily bread, there is among us a small band of workers moving on a higher plane, men who have set themselves to increase the sum of human knowledge. Some of these are engrossed in science, discovering ameliorations to sickness and pain. Some are exploring the desert and the mountain and charting unknown regions and increasing man's resources; while other brave men face the hardships of ice, storm, and starvation and fight their way to the Poles. All these explorers we delight to honour.

But to us the Poles have no professional attraction: we shall not be called upon to house the surplus population and the unemployed in those regions. The inhabited world and a knowledge of past civilisations have for us a much deeper interest, and we owe a great debt to those keen sportsmen who have set themselves to discover the relics of past races, unearthing buried cities, their temples and palaces, deciphering records and showing us how men have lived and fought and built.

To such work our distinguished visitor, Dr. Arthur Evans, has devoted his mind, his time, and his means, with the splendid result of reclaiming from oblivion the long-hidden treasures of Crete.

It is our privilege periodically to recommend for His Majesty's approval a name for the distinction of the Royal gold medal. It is for one who by building, by writing, or by research has advanced the art of Architecture. The first explorer to receive this mark of appreciation was the great pioneer of excavation, Sir Henry Layard, whose winged bulls, so prominent a feature in the British Museum, may be found some day to have relation to the Bulls of Knossos which Dr. Evans describes.

At a later date we had the honour of conferring the medal upon Dr. Schliemann, whose splendid tenacity of purpose resulted in the discovery of Troy and of Mycenæ, with the tomb of Agamemnon.

It is my pleasant duty to-day, in your names, to present the King's gold medal to Dr. Arthur Evans, who, in discovering the Palace of Minos, has, it is no exaggeration to say, completely revolutionised our accepted ideas of the early civilisations surrounding the Mediterranean basin. He has converted myth into history and floating prehistoric tradition into established fact.

But what is of paramount interest to us, he has shown that centuries before the Parthenon was thought of, indeed before the Greek nation came into being, there were architects

Digitized by Google

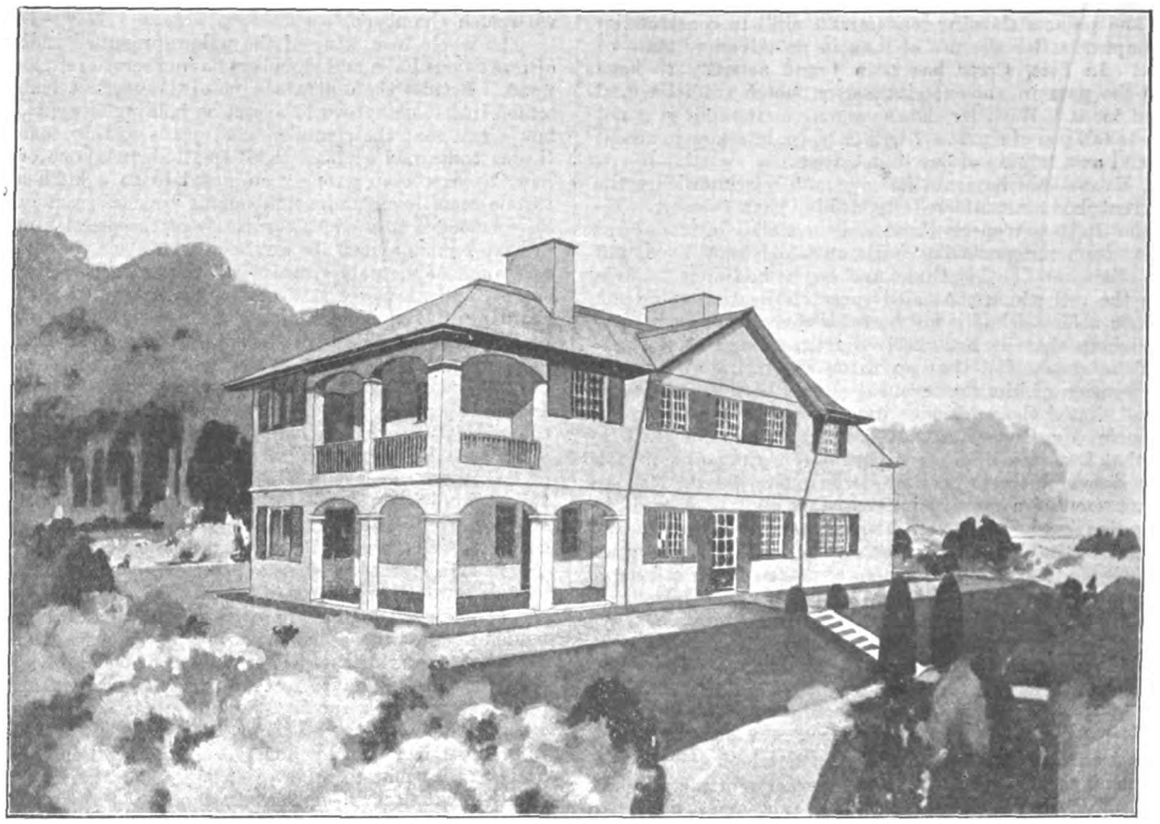
at Knossos and in other parts of Crete building huge monuments and palaces showing consummate skill in construction and adaptation for the use of man in an advanced state of culture. In fact, Crete has been found actually to have played the part in ancient civilisation which tradition had claimed for it. With Dr. Evans among us to-night it is not for me to tell you of Crete. I will only ask him now to accept the medal as a tribute of our high esteem.

Dr. Evans said he could not adequately acknowledge the very great honour conferred upon him that evening. He knew that in some respects Crete and the Palace of Minos was very far from the workaday world in which they lived, but on the other hand he felt that anything he had done towards lifting the veil which concealed early civilisation could not have been achieved had it not been for the very powerful and devoted help that he had received from a band of workers, and, therefore, he felt that anything which was said in the kind reception of him that evening should be shared by those who had shared the work with him, amongst whom were Dr. Mackenzie, Mr. Christian Doll and Mr. Theodore Fyfe. He knew that from some points of view—from the point of view of grandiose architecture as they saw it in Greece—the Minoan work represented a more primitive stage, but it showed the extraordinary advance which had been achieved a thousand years before the days of Greece. He also wished to express his gratitude to the British School at Athens, and in a more particular degree to Dr. George Macmillan, the Secretary, without whose cordial collaboration they could never have achieved the results which had been gained.

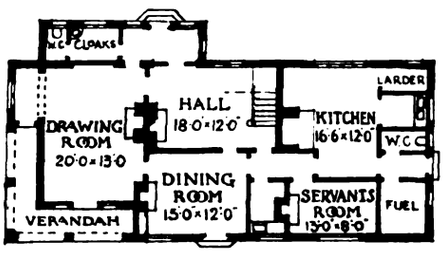
Dr. Evans gave a short lecture on

The Palace of Knossos as a Sanctuary and the "Miniature Frescoes."

He drew attention to the evidence that had accumulated throughout the whole course of the excavation of the religious aspects of the great building. It was a sanctuary as much as a palace, and the Minoan kings were also priests. It was unlike other palaces either of the ancient or modern world, in which the demands of cult might be satisfied with a single shrine or chapel. In some respects it might rather be compared to the Vatican, for it swarmed with shrines and halls for ritual functions. The evidence of a whole series of finds had now shown that the chief divinity of Minoan Crete was a virgin goddess akin to Rhea and the Asiatic Artemis, and the kings of Knossos seem to have administered their realm as her high priests. Besides the pillars of her shrines the aniconic image of the goddess was the sacred double axe, and the wonderful painted sarcophagus discovered by the Italian Mission at Hagid Triada, near the southern coast of Crete, showed an actual scene of worship in which offerings were being made to a pair of these axes rising from stepped pedestals. The double axe, as was well known, recurred at a later date among the kindred Carian population as the attribute of their Zeus, called from its native name *labrys* "Labrandeus," and the view, put forth on philological grounds, that the Cretan Labyrinth derived its name from a dialectic form of the same name was fully confirmed by the archæological evidence. The Palace of Knossos was before all things "The House of the Double Axe," and was thus the true Labyrinth of tradition.

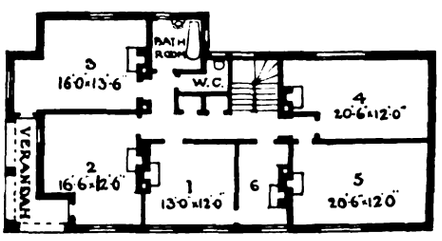


Dr. Evans said that exception had been taken to his view that the double axe, so constantly recurring on the palace blocks, was anything but a mere mason's mark, or had any religious signification. Certainly there were many masons' marks on the palace blocks besides the double axe. But in several cases it could be shown by their distribution that these had a distinct application to the character of individual parts of the building. Several of these marks, in fact, belonged to the current hieroglyphic system and possessed a recognised ideographic value. The double axe, for instance, could be shown to recur in what appeared to be official titles and coupled with the palace sign. It was far more numerously applied to the palace walls than any other sign, and marked the principal lines of wall and entrances, the grand staircase and the most important reception hall. Its repeated occurrence on the stone pillars rising in the centre of two small basement rooms might be taken to show that they possessed a special sanctity. This view had been doubted when Dr. Evans first put it forth, but the discovery of many other similar pillar rooms exhibiting evidence of religious usage has now put the matter beyond doubt. These "pillar rooms" were the "crypts" of Minoan sanctuaries. In the south-east House of Knossos the base of a sacred double axe was actually standing against such a pillar, which itself, again, was marked by the sacred symbol. Ritual vessels and bases of the same kind were found both in the palace and elsewhere, either within or in close association with such chambers.



The whole west wing of the palace presented indications of its various halls and chambers having served religious purposes. Besides the central shrine of the goddess, here represented in her nether-world aspect as holding serpents, it was now clear that the chambers contiguous to the room of the throne contained at least three small shrines, one of which had at first been wrongly supposed to be a kitchen. The throne room itself and neighbouring benches seem rather to have belonged to a small consistory of the priest kings than to have been intended for any secular usage. At the north-west angle of the palace, near this, had existed another pillar shrine, and an upper hall of a ceremonial nature, the wall-paintings taken from which exhibit a columnar structure with pairs of double axes stuck into the capitals and sacral horns above the stylobate. Other fragments of fresco from the same place showed votaries bearing gold and silver vessels, and others, again, related to the sports of the bull-ring, which themselves seem to have had a religious connection. But the Miniature Frescoes, derived from some sanctuary structure on an upper floor near the northern "piazza," gave the fullest impression of the religious functions of the palace. Dr. Evans described the methods by which two complete designs, each forming a separate panel, had been reconstructed from the fragmentary remains. One of these depicted crowds of spectators of both sexes looking on at a dance of gaily-dressed females in a court below, and a discovery made by him this season had supplied a welcome illustration of the character of the performance. From a tomb just excavated near the royal tomb already explored, and of the same interesting structure, he had obtained a gold signet with a finely-engraved design, the lower part of which exhibited similar dancing female figures parallel in attitude and arrangement to those of the fresco. But in this case, together with sacred emblems, a figure of the great Minoan goddess appeared above in a reserved celestial space. The dance then was of a religious and orgiastic character, and in honour of a goddess who in a later Hellenic garb appears as Aphrodité Ariadnè. The court, with dancing votaries depicted on the fresco, which was obviously some part of the actual "palace" system, may be taken to represent the actual "Dancing-place of Ariadné," which Daedalos, according to the Homeric tradition, was said to have fashioned "in broad Knossos."

The other panel showed the same crowds of spectators thronging the courts and terraces of a building, the central feature of which is a small, brilliantly-coloured pillar shrine with a taller central compartment and two lower wings. It is probable that this may actually represent a shrine existing in the northern quarter of the palace. Some curious evidence to which attention was called seemed to indicate that in the latest period of the remodelled palace a pillar shrine of the same kind had stood in the part of the west wing facing the central court, near the place where the repositories of the earlier shrine of the snake goddess had been discovered. On the face of a low stylobate bordering the court in this quarter traces had appeared, made clearer by successive seasons' rains, of two pairs of column bases with an intervening blank space between them, where, according to the typical plan of the Minoan pillar shrines, as shown on the fresco, the central cell would have risen. It was noteworthy, moreover, that in the inner space within one of these wings had been found a series of clay seal impressions showing the great Minoan goddess on a height between two guardian lions with a small pillar shrine on one side. These sealings themselves naturally indicated the neighbourhood of a sanctuary, and what made the evidence still more suggestive was the appearance inside the central space between the pairs of column-bases of a curious recess, in the bottom of which remains of a chest containing clay documents had been found. Putting two and two together, Dr. Evans had arrived at the conclusion that they had here the more or less complete ground-plan of a small Minoan pillar shrine, the plan and elevation of which were now shown.



Dr. G. A. Macmillan proposed votes of thanks to the President for his address and to Dr. Evans. He said he was extremely glad to see reference made to the proposed architectural school at Rome. When allusion was made to the project last year there was a flutter because some thought the British School was already in existence there. The members of the British School of Archæology in Rome had, however, put themselves into communication with the Council of the Institute and had met with such cordial treatment that he had every reason to believe that the admirable scheme proposed would be carried through. Mr. John Simpson would represent the Institute on the committee, and the speaker

said he felt sure that when the movement took shape and form it would satisfy every one interested.

Mr. GEORGE HUBBARD seconded the motion, which was carried unanimously.

It was announced that at the next meeting on November 15, Mr. H. Inigo Triggs would read a paper on "The Planning and Laying-out of Public Places."

HOUSE ON THE BRANKSOME CHINE ESTATE, DORSET.

THE house in the Branksome Chine is built of rough local brick, rough casted, and roofed with Delabole grey slates. A north Italian-Swiss effect was aimed at, and the colouring assists the idea. The woodwork is pale green and the external walls are distempered light pink. Messrs. CUBITT & GOTTS were the contractors, of Ipswich, and Mr. R. HEYWOOD HASLAM, of London, is the architect.

New Oak Choir Stalls were dedicated on Friday last by the Bishop of Exeter at the church of St. Thomas, Exeter, as a memorial to the late Thomas Maitland Snow. Improvements have also been carried out in the sanctuary, including new carved oak altar rails. The work has been executed by Messrs. Dart & Francis, of Crediton, from the designs of Mr. Harbottle Reed, F.R.I.B.A., of Exeter.

CHELTENHAM AND DISTRICT.*

(Concluded from last week.)

SOME nine miles on the road between Chipping Norton and Moreton-in-the-Marsh is Chasleton House, perhaps the most interesting building in this district, for as it now appears it seems to belong to the seventeenth century, and everything about it suggests the Stuart period. As it was planned and designed in the reign of Charles I. so it has remained. You feel when you enter that you are in a house with a history; fortunately that history has been preserved. It was built in 1603 by Walter Jones, a wealthy wool merchant of Witney. The property and original house belonged to the Catesby family, and it was the celebrated Robert Catesby, one of the Gunpowder Plot conspirators, who sold the property to Walter Jones, in all probability to raise money to carry out the plot. One of the most exciting episodes connected with this house occurred in 1651, when Arthur Jones, a grandson of Walter, and a supporter of the Royalist cause, arrived home in the middle of the night after the battle of Worcester; he was dead-beat when his wife let him into the house, and it was not long before the Parliamentary forces were after him. He was hidden in haste by his wife in the secret chamber which led off their own bedroom, the opening to which was covered by tapestry and fortunately not discovered by the soldiers. They insisted, however, after searching everywhere, on being fed and spending the night in that particular room. Mrs. Jones drugged their wine, and when they were all fast asleep she let her husband out, and he escaped on one of his pursuers' horses.

The house is a fine specimen of Jacobean work, being built on more formal and symmetrical lines than the other houses in the district. It is square on plan, with a small central courtyard. The entrance front is on the south, with two projecting square bays with no side lights on either side. The one on the left forms a porch, and the other is a bay to the dais of the hall. The staircases are placed in two central towers on the east and west fronts, and on the north side is a small square projecting bay in the centre of the elevation, the whole forming a very symmetrical plan. Externally the house is very imposing, being higher than usual, and the two staircase towers accentuate this. The rooms are full of interesting furniture and good tapestry, and the screen in the hall is a very fine example of Jacobean work. The great parlour at the north-east corner of the building is panelled, and has a fine chimneypiece; there are also several good chimneypieces in some of the other rooms. The house contains some good plaster ceilings, that of the long gallery, which has lately been restored, being particularly fine. This gallery, which runs the whole length of the northern front, is 70 feet long and 18 feet 6 inches wide. About fifty years ago the house was re-roofed with Westmorland slates. From the top of the east staircase tower a very fine view can be obtained of the beautiful formal gardens below. There are several interesting relics preserved in the house, the most important being the Bible used by Charles I. on the scaffold, which he presented to Bishop Juxon, who attended him to the last, and who retired to Little Compton after the King's death. Another interesting document is the original deed for the sale of the property by Catesby to Walter Jones. It is curious to note one peculiar feature of this house which is also common to many others, and that is the use of other people's coats-of-arms in the overmantels of the chimneypieces. In most cases they are the arms of neighbouring families, and it has been suggested that it was a custom for the owner's friends to give him a carved chimneypiece containing their own coat-of-arms for a present. On the south-east side of the house is the church dedicated to St. Mary. Part of it dates from the beginning of the twelfth century, Bardolph de Cestron building a church there on the site of an old British burying-place. It is a picturesque building, with a southern tower, the whole forming, with the house, a very pretty group. The church was restored in 1878, when the west-end gallery and high pews were removed, and the old three-decked pulpit, which bears the date 1629, was cut down and reduced in height. The oldest part of the church is the north door; the original tower of the church was destroyed by lightning, and the present one dates from the end of the seventeenth century. To the north-west of Chasleton is Moreton-in-the-Marsh, a very interesting town which time did not permit us to visit, but some ten miles further off in the same direction is Broadway, which probably has the reputation of being one of the most picturesque villages in this part of the country.

The old church is dedicated to St. Eadburga, the granddaughter of King Alfred the Great, and dates from the middle of the twelfth century. It is cruciform in plan, with a plain central tower, the chancel and transepts being of a later date.

The nave and aisles were originally covered with lead, but this being stolen the remainder was taken off and sold about fifty years ago, and the present slate roof substituted.

The font is peculiar, being very deep and circular, and entirely without ornament, and probably dates from the twelfth century.

In the north transept are stored the remains of a good Jacobean pulpit and sounding-board. There is also some good glass of the fifteenth century in the windows of the chancel and west end.

The church is some distance from the village, and consequently is very little used, as a modern church has been built which is more accessible. Adjoining the churchyard is Broadway Court, which has been recently added on to by Mr. Guy Dawber. The old house was formerly the residence of the Sheldon family, but the only part of it that is left is the old gateway, which has been utilised as a front entrance to the new house.

One of the most interesting houses in Broadway is Abbots Grange, which formerly belonged to Pershore Abbey, and was built in the fourteenth century. This house has been so often sketched and measured that probably everyone is familiar with it. Considering that it has in turn been used as a village lock-up, a workhouse, and subdivided into cottages, it has really suffered very little, and its present owner has very carefully preserved the old features of the house, and even the new studio which Mr. A. N. Prentice has lately added is built on the foundations of the old kitchens. Some of the windows show traces of the floors which had been inserted, as they are filled in above the transoms. The hall, which has a good open timber roof, runs north and south, with the dais at the south end and the kitchens on the north. There is no trace of any fireplace, and if there was one in the centre of the room there is no sign of any exit for the smoke.

A curiously contrived staircase leads to the Abbot's solar, which has a squint which commands the kitchen door; this room also contains the remains of a fireplace, and has a good two-light window with reticulated tracery.

The Lygon Arms is another interesting house. This inn dates from the middle of the sixteenth century, and the entrance door bears the date 1620 and the names John and Ursula Trevis. For over 300 years the inn was known as the old White Hart, the name being changed when it came into the Lygon family at the beginning of the nineteenth century. Charles I. is supposed to have stayed there, and met Sheldon, one of his supporters, in the oak-panelled room; and Cromwell slept here before the battle of Worcester, probably occupying the room which now bears his name. This room has a fine enriched plaster ceiling and frieze.

Passing through the villages of Willersley and Ashton-sub-Edge, both of them containing some very nice domestic work, you come to Chipping Camden, which is supposed to have derived its name from its being the meeting-place of the Saxon kings, who, at the end of the seventh century, held a conference here about the war with the Britons.

It was the centre of the wool trade in the fourteenth century, and carried on a considerable trade with Flanders. The town remained prosperous throughout the fifteenth century, and it was not until the Flemish settled in the West of England and started manufacturing cloth at the place of production that the town gradually declined. In the eighteenth century it again enjoyed a period of prosperity, as it was the centre of the silk trade.

The church dedicated to St. James was built at the end of the fourteenth century, chiefly at the cost of William Grevel, a wool stapler. It is in the Decorated style, with a fine embattled tower at the west end 120 feet high, with massive buttresses and surmounted by twelve pinnacles. It has two side chapels, the one on the south side containing a fine monument to Sir Baptist Hicks, first Viscount Camden, who died in 1629. There are also monuments to the Noel family and some brasses, the earliest of which is to the memory of William Grevel, the supposed founder of the church, and his wife; he is described thereon as the "Flower of the Wool Merchants of England."

The nave consists of five bays, and has an east window above the chancel arch. There is a tradition that the tower was built by the same builder as that of Gloucester Cathedral, for there is an old rhyme in existence which runs:—

"A man by the name of Bower built Gloucester
Cathedral and Camden Tower."

* A paper read before the Architectural Association on October 22 by Mr. F. Dare Clapham, F.R.I B.A.

Digitized by Google

There is in the church a magnificent crimson cope, very richly embroidered, and dating from pre-Reformation times.

Near the church a fine mansion was erected by Sir Baptist Hicks at the end of the sixteenth century. It was destroyed by the general in command of the Royalist forces in the civil wars to prevent it from falling into the hands of Cromwell. Very little of the old manor house remains; it was built in the Italian style, and it was probably one of the most magnificent houses of the day, as it is stated that 30,000*l.* was spent on it.

Sir Baptist Hicks also built the row of picturesque almshouses near the church, and in 1627 the old market hall, which has a stone arcade and fine open timber roof, and forms the most noteworthy feature in the main street.

The old Wool Staplers' Hall is now used by Mr. C. R. Ashbee as a private residence. It has a curious oriel window which Mr. Ashbee explains was probably the result of rebuilding in the sixteenth century the original mediæval window, which had probably fallen. In the big room on the first floor there is a large open fireplace with the arms of the Calfe family in one of the spandrils. Its present owner has done much to preserve the original features of the house. Opposite this house is the one formerly occupied by William Grevel. It has two fine bay windows showing distinct traces of Flemish design.

Some few years ago the Guild of Handicraft moved from London to Chipping Camden, and the old silk mill became their principal workshop.

Some three miles west of Cheltenham, on the way to Gloucester, is Churchdown, or Chosen, with its church standing right on the summit of a hill some 600 feet to 700 feet high. In all probability this hill served as a Roman signalling station. There is a quaint inscription on the tower recording that this "Bellhows was Bvyldede in the yeere of ove Lorde God 1601." Tradition says that this church served two villages, the one on the north being called Chosen and the one on the south Hucclecote. The inhabitants of the latter village appear to have been very jealous of the former, and it is said they objected one Sunday to the text, "Make Thy Chosen people joyful," and indignantly asked, "What have the Hucclecote people done?"

About four miles further on to the south-west is *Gloucester*, a city which has often figured in history; it was an important military station under the Romans, and surrendered to the Saxons towards the end of the sixth century. Owing to its position on a navigable river, it has always been of some importance.

In the time of William the Conqueror it was a favourite resort for his court, and several of the Norman kings used to spend Christmas there. In 1087 the city was nearly destroyed during the contest between William II. and his brother Rupert. Later it was the scene of many conflicts between Henry III. and the barons, owing to his having appointed a foreigner as Constable of the Castle. It suffered from fire three times in the twelfth century, and again in the middle of the thirteenth century. Parliaments were held there by Edward I., Richard II., and Henry IV. In 1483 Richard III. came to Gloucester after his coronation, and from here gave the orders for the murder of his two nephews

The city opposed the Royalist cause in the Parliamentary wars, and for this reason at the Restoration its walls were destroyed. The siege of Gloucester lasted nearly a month in 1643, the Royalist army being under the command of the king.

The walls of the city were 5 feet to 9 feet thick, surrounded by a deep moat; there were four gates, north, south, east and west, about a quarter of a mile apart, and where the four roads met in the centre of the town there was a High Cross, which was demolished in 1750.

One of the most interesting buildings in the city is the New Inn, built at the end of the fifteenth century by John Twining, to accommodate the number of pilgrims who flocked to the tomb of Edward II. The New Inn was probably so called because it was built on the foundation of an older one; it was formerly one of the possessions of the Abbey of St. Peter, and after the dissolution of the monasteries it was granted to the Dean and Chapter, in whose possession it remained until recently, and formed part of their income. It is a picturesque, half-timber framed building, built round two courtyards, and covers a good deal of ground, being, without the stables, 170 feet long. The rooms all lead to open galleries running round the courtyards, approached by outside staircases to the different floors; the whole of the timber is chestnut, and parts of it are richly carved. There is a well-preserved angle-post at the corner of New Inn Lane, on which is some beautiful carving. There are two figures, both angels, holding scrolls bearing the words "Salve" to welcome the coming, and "Benedicti" to speed the parting guest. The canopies above the figures are particularly good.

In Westgate Street there is a house with an old front with good windows bearing traces of Flemish influence; a chimneypiece inside bears the date 1633, and is celebrated as the house which Colonel Massey made his headquarters in 1643, when the city was besieged by Charles I. Many of the houses contain good panelling and elaborately carved chimneypieces.

In the house opposite the Corn Exchange, in Southgate Street, which has a carved and ornamented front, there is a handsomely carved chimneypiece, bearing the date 1650.

The house where Robert Raikes (the founder of the Sunday Schools) used to live is an interesting half-timbered building with three gables.

There are several good examples of gate piers in the city, those standing in front of the Foresters' Hall and another house in Westgate Street being most noticeable. There are numerous churches in Gloucester, but most of them are of a late date, having been erected on the site of earlier buildings.

It is not possible to do more than give shortly a few particulars about the history of the cathedral.

At the end of the sixth century, on the site of the present cathedral, a monastery was first built which was destroyed by fire, as was also in 1058 the Benedictine one which superseded it.

The foundation stone of the present cathedral was laid in 1089, Abbot Serlo being in charge of the work. Twice at the beginning of the twelfth century the fabric suffered by fire, and it is probable that in one of these fires the original timber roof of the nave was destroyed. This flat wooden roof was some 20 feet higher than the present vaulting, which was finished about the middle of the thirteenth century. The columns of the nave show traces of fire, being much calcined. There were two more fires at the beginning of the fourteenth century, and the south aisle of the nave was then built to save the south side from falling.

The murder of Edward II. in Berkeley Castle did much to spread the fame of the abbey church, for Abbot Thoky, fearing no vengeance from the Queen, brought the body of the dead king to Gloucester. When Edward III. came to the throne this loyal Churchman had his reward, for a fine tomb was erected by the new king, and streams of pilgrims began to flock to the city, and the coffers of the abbey were consequently enriched.

It is said that the funds at the disposal of the monastery at this time were sufficient to completely rebuild the abbey.

In the early part of the fifteenth century the reigning abbot destroyed the west front with its two towers, and is supposed to have added the south porch. In about the middle of the same century the central tower was demolished as far as the Norman piers, and the present beautiful tower was added, and the lady-chapel was built towards the end of this same century. It was not, however, until the reign of Henry VIII. that the abbey was made a cathedral.

The nave piers are just over 80 feet in height, being nearly twice the height of those at Norwich; they are about 21 feet in circumference and 12 feet 6 inches apart. The present flooring of the nave is some 10 inches higher than the original pavement.

Mr. Waller, who carried out the repairs of the cathedral in 1856, says that the whole of the nave was painted. It was at one time proposed by Kent to flute the columns, but happily the architect found out that they consisted of a stone casing filled in with rubble.

We were fortunate enough to be shown over the cathedral by the superintending architect, Mr. F. W. Waller, and the careful ½-inch scale plans which he had prepared of the various stages of the tower were of great interest. The tower at the roof level is 40 feet square and 225 feet high; it is carried by four Norman piers, which are loaded to the extent of 12 to 13 tons per foot super., a load which would make a district surveyor's hair stand on end at the present day, for the total weight of the tower is about 4,700 tons. The pierced corner pinnacles, which weigh 25 tons each, are supported at the inner angles by slight squinch arches, and probably with the idea of reducing the weight of the topmost storey, the walling of the panels is only 8 inches thick.

The cloisters were built during the latter half of the fourteenth century, and are probably unsurpassed in beauty by any in this country. The monks' lavatory, which occupies four bays of the northern side of the quadrangle, is 47 feet long, and is in a fine state of preservation, even the waste water tank being discovered about twenty years ago.

Digitized by Google

Perhaps the most interesting part of the cathedral is the choir, which at first sight appears to be entirely Perpendicular work, but in reality this is only a thin casing to the original Norman work behind; this casing was put on during the fourteenth century, and is very cleverly contrived. In order also to make room for the splendid east window, which is 72 feet high and 38 feet wide, and some 5 feet wider than the choir, the two end Norman piers of the apse were removed, as was also the eastern apsidal chapel, when the lady-chapel was built; these alterations are made perfectly clear by an examination of the crypt, where the foundations of the original Norman work remain. On the north side of the choir is the tomb of Edward II.

It would take an entire evening to describe all the beauties of this splendid cathedral, which is probably so well known to all of us, and, therefore, these brief remarks must suffice to-night to deal with what is probably one of the most interesting ecclesiastical buildings in this country.

This concludes the list of places visited on the fortieth excursion of the Architectural Association, an excursion rendered all the more enjoyable by being blessed with the only real summer weather we have had this year.

I should like to take this opportunity of expressing my gratitude to Messrs. Hennings, Searles-Wood, Gregg and Yates for the photographs with which, by their kindness, I have been enabled to illustrate this paper, also to the various members of the party who have so kindly lent the drawings and sketches which adorn our walls this evening. I think you will all agree with me that our hard-working honorary secretaries, Mr. Talbot Brown and Mr. A. W. Hennings, arranged for us a most excellent programme, not the least charming feature being the modern work which it was our good fortune and privilege to see, and which will, I am sure, be the centre of interest on future excursions in the Cotswold district.

Mr. E. Guy Dawber, in proposing a vote of thanks to Mr. Clapham, said he thought that they might make it a rule that every year one of the members who went on the annual excursion should read a paper dealing with the places visited and so furnish a delightful record, which would be appreciated by the members who were not able to go with the party. That evening's paper was exceptionally valuable because it was not a mere catalogue of interesting details and events, but they had been told about the people who lived in the houses and places, and to his mind one of the great charms of Old English architecture was the romance associated with it. Years ago on the excursions the President for the time being used to give a brief résumé of the places visited, but now the members of the party were so anxious to sketch and photograph that nothing was said by way of introduction. He suggested that the President in the second year of office should give a short résumé before the members got to work. He thought Mr. Clapham struck the key note of his subject when he said that the Cotswold work depended for its charm on simplicity and proportion, and when they had said that they had uttered everything that could be said about good architecture. The Cotswold district was cut off from the surrounding country, and he thought there was no doubt that that remoteness and the wealth of the community which had accumulated during the prosperity of the wool merchants had given them such a great number of beautiful buildings all more or less bearing a family resemblance. In other parts of England they got variety of treatment, but in the Cotswold district they saw work which showed that the tradition of building lasted for a hundred years. It was interesting to watch the way the old builders took up the Renaissance, introducing it into the accessories of the house, but when once they had mastered the Classical work, they were such an artistic people and the tradition of good work was so strongly imbued in them, that they were able to do the most charming buildings just as finely as the earlier work.

Mr. H. D. Searles-Wood seconded the vote of thanks.

Mr. John Johnson supported the motion and hoped that the result of the lecture would be to induce more members to go on the excursion.

Mr. C. E. Bateman, expressing his appreciation of the paper, said they had within the space of an hour gone over ground which had taken them a week to visit.

Mr. A. N. Prentice said the same type of building seen in the Cotswold district was curiously enough found in Northamptonshire, and he supposed that was accounted for by the seam of stone which ran through England from the Wash to the Severn, as all over that district one found the same kind of building and the same architecture.

Mr. S. Flint Clarkson also supported the vote of thanks.

The President, in some concluding remarks, said it had been agreed that the annual excursion was in future to be the subject of one lecture during the session and thus secure a record of the work done.

Mr. Clapham, in his reply, said he had only spoken about one excursion. Unless members had been on one they could not realise the fascination of such events. He compared the delights to that found in a Christmas gathering. They looked forward to it because it was the one week in the year when they could forget office worries and cares, and when principal and pupil had one thing in common—the enjoyment of the beautiful architecture of the rural districts of their own country.

MIDDLESBROUGH LIBRARY COMPETITION.

We have received the following letter from the gentlemen who have acted as ringleaders and spokesmen of the architects dissatisfied with the assessor's award:—

Houndgate Chambers, Darlington:
October 28, 1909.

Dear Sir,—We have now obtained counsels' opinion in regard to above, copy of which we enclose for publication.

We trust that this action, subscribed to by eighty-three of the competitors, will do some good in future competitions, showing as it does our legal position, and we would suggest the necessity of the assessor drawing up the conditions himself when practicable or, if he accepts them, being bound to see that they are fully carried out.

In concluding this matter we would desire, on behalf of the large body of architects whom we represent, to acknowledge your extreme courtesy and to thank you for your assistance in ventilating the matter in your Journal and the valuable support you have given us.—Yours faithfully,

Hoskins & Brown,
Kitching & Lee,
W. H. Bourne.

Opinion of Mr. C. A. Russell, K.C.

1. For the purpose of this opinion I assume (but without expressing any opinion on the point) that the designs to which the professional assessor awarded the first and second places did not comply with the "Instructions to Architects."

There is no evidence of fraud or misrepresentation on the part of the committee or of the assessor, and if the unsuccessful competitors have any right of action it must be for breach of contract.

I think the effect of the advertisement and the "Instructions to Architects" was that the Library Committee (as agents of the library authority, the Borough Council) promised each architect who should compete that they would appoint a professional assessor to adjudicate on the designs, that they would submit his design to such assessor, and that if such assessor should adjudge his design to be the best, second best, or third best, respectively, they would pay him 50*l.*, 30*l.*, or 20*l.*, respectively.

I am of opinion that there was good consideration for such promise, and that an action would lie for the breach of it (*see, e.g.*, Carlill *v.* Carbolic Smoke Ball Co., 1893, 1 Q.B. 256), but if this was the whole of the promise it is clear that there has not been any breach of it. In order to establish a cause of action, the unsuccessful competitors must show that there was an undertaking by the committee either (1) that only such designs as complied with the "Instructions" should be submitted to the assessor, or (2) that the assessor in making his award would disregard all designs which did not comply with the "Instructions," or (3) that the assessor would correctly decide the question whether a design did or did not comply with the instructions. I am of opinion that no such undertaking can be derived from the advertisement or instructions. I think it would be most mischievous to treat the committee as having reserved to themselves the right not to submit a design to the assessor on the ground that in their opinion it did not comply with the instructions, and I think the provision that the judgment of the assessor shall be final excludes any right of the committee to override or disregard the award of the assessor on any ground whatever. I am of opinion that the unsuccessful competitors have no right of action against the Council or committee.

With regard to the assessor I am of opinion that there was no contract between him and the competitors, and that they have no cause of action against him. No doubt it was part of his duty in adjudicating upon the designs to consider whether they complied with the instructions, and not to award the first, second, or third place to any design which in his opinion did not fairly comply with them. But I think this was a duty of a judicial or quasi-judicial character and not

Digitized by Google

one for a breach of which an action would lie against the assessor.

Even if there has been a breach of contract on the part of the Council or committee, I think an unsuccessful competitor could not recover as damages any expenses or loss caused by his work in preparing a design, as such expense or loss would not be a consequence of the breach. The competitor to whom third place was awarded might perhaps recover as damages the difference between first and third premium, but in the case of the other competitors I think nominal damages only would be recoverable.

2. I have advised that no action will lie. But the competitors might be regarded as parties to a reference to the assessor, and if it could be shown that he had made his award without considering whether the successful designs complied with the instructions a Court would perhaps, upon a proper application, set the award aside. But there might be difficulty in proving that there was a submission to the assessor which would bring the case within the Arbitration Act (see Sec. 27), and if the assessor had considered and determined, however erroneously, the question whether the successful designs complied with the instructions, I think the Court would not interfere with his decision.

3. Possibly it would be some protection to competitors if in all such cases as the present it was made a definite instruction to the assessor that he was to treat as disqualified for a prize any design, however excellent in other respects, which did not fully comply with the conditions of the competition. But I think the only effectual protection of the competitors is the competence and fairness of the assessor.

(Signed) CHARLES A. RUSSELL.

Temple: October 11, 1909.

Opinion of Mr. C. E. Brackenbury.

I am of opinion that the unsuccessful competing architects in this matter have no cause of action.

The County Borough of Middlesbrough, through its Free Library Committee and by its accredited officers, made a certain offer, the conditions of which were contained in an advertisement (which I have not seen, but which was, no doubt, in usual form), and in "Instructions to Architects," and on a plan. In reply to this offer about two hundred architects submitted designs and impliedly accepted the conditions of the said offer. Among the conditions was the following:—"A professional assessor will be appointed to adjudicate on the designs . . . and the judgment of these by the assessor shall be final." Moreover certain dimensions and areas were indicated as "would most nearly meet the requirements," though it was added that "small deviations would not disqualify."

Various questions were asked upon the "Instructions" and "Replies to Queries" were sent to all the competing architects. I do not think that these "Replies to Queries" constituted any new contract or made any material alteration in the previous conditions. The contract, therefore, between the Corporation of Middlesbrough and the competing architects consisted in the said advertisement, the instructions, plan, and replies to queries. Has there been any breach by the Corporation of this contract? I think not.

It is alleged that the first premiated design did not conform to the instructions, and should therefore have been disqualified. I would point out, in the first place, that the judgment of the assessor was to be final, and I understand that in his judgment "the authors of the successful plans had complied with the spirit as well as the letter of the conditions." This view seems to be confirmed (1) by the Competitions Committee; (2) by the President; and (3) by the Council of the Royal Institute of British Architects.

Secondly, whether the "Instructions to Architects" have been complied with or not by the successful architects is wholly a question of fact. From my careful examination of the papers and small lithographic plans of the accepted designs submitted to me, I do not find any sufficient evidence to support the view that "the award was given to a design which did not comply with the conditions as laid down by the Council," or that there was any "wholesale violation" or "direct contradiction" of the conditions.

The divergence of views which exists seems to me to have arisen through a misreading or a misinterpretation by a large number of architects of the instructions given to them. Thus, one of their main contentions refers to the "Instruction" (paragraph 3, p. 4), which reads:—"The general lending and reference libraries are to be placed in the northern part of the block adjoining the dwelling-houses in Dunning Street, with main entrance from Dunning Street and secondary entrance from Grange Road East." This appears to have been construed by some as though it read "the general lending and reference libraries are to be placed in the *most* northern part of the block *and are* to adjoin the dwelling-houses in Dunning Street." Now, the northern part, naturally one would have thought, merely indicated that the libraries were to be in the longer arm of the letter L, which roughly forms the site, and the word "adjoining" grammatically applies to the word "block" and not to the word "libraries." I am of opinion, therefore, that the unsuccessful competitor properly interpreted and conformed to this instruction. The replies to queries Nos. 72, 100, and 106 do not, in my opinion, vary, and are not inconsistent with the instruction referred to.

I will now deal with other alleged "violated conditions." The common counter for the boys' and girls' rooms hardly seems a vital matter, and the first premiated design appears generally to comply with the instructions.

The sizes suggested for the various rooms were approximate indications, not strictly binding, as appears from the phraseology used and also from reply to query No. 28.

As to the secondary entrance from Grange Road East, it is true that reply to query No. 84 answers in the affirmative, but with a qualification, the question "Should there be two entrances from Grange Road?" But the reply to query No. 86 does not say that such secondary entrance is absolutely necessary, and there was no reason for so regarding it.

Lastly, in reference to the communication shown in the first premiated design between the news room and entrance hall, in addition to that *via* the janitor's room, such communication, though existing, need not necessarily be for the public use, and therefore the doors indicated are not to be regarded as a violation of anything in replies to queries Nos. 80 and 81.

Comment might also be made on such alleged violations in the accepted design as the juvenile book-store not having steel galleries, although the instructions said it *must be* so fitted; as the furnace being in a basement, though no basement was anticipated; as the reference library not being "entirely lighted from the roof direct"; as want of extension room; and as the catalogue room being on the first instead of the ground floor; but it must be taken that none of these points is of great importance, or is stated to be obligatory, or goes to the root of the matter.

It is, of course, unfortunate that any question of verbal construction or legal interpretation of instructions should have arisen, but it was perhaps unavoidable among such a large body of keenly competing architects, and when undoubtedly the degree of elasticity allowable was not strictly definable. If competing architects agree to accept the judgment of an assessor as final, they must, generally speaking, be bound thereby. Their duty is to read carefully the instructions, but not to read *into* them anything that is not there, and unless there are distinctly obligatory provisions, non-compliance with which is stated will be held to be a disqualification, it will be well to allow themselves a reasonably large latitude in the production of the best design.

On the other hand, the authors of any instructions or conditions of competitions should state clearly, fully, and definitely their requirements, and set out distinctly what is and what is not compulsory on all competitors, and what is left within the discretion of the individual. My own view is that any instructions should be so well and carefully compiled that no subsequent queries or replies thereto would be necessary, and that no supplementary information should be given.

(Signed) C. E. BRACKENBURY.

16 Piccadilly, Bradford: October 12, 1909.

TESTS OF CAST IRON.*

Transverse Bending Tests.

(Continued from last week.)

TABLE III. gives the transverse tests, and in this case also it will be noticed that whilst the breaking weight of the transverse test-bars shows a slight variation, when the latter are worked out on the exact section of the bar to the moment of resistance, there is very little variation in the tests obtained from those bars with increased percentages of silicon, whilst the second part of the table shows that increasing amounts of silicon have decreased the strength, which confirms the tensile tests in this respect. In this case, also, whilst the percentages of combined carbon are not very materially altered, the fractures in the 2 inch by 1 inch test-bars show increasing openness as the silicon increases from 1.30 to 2.00, the bars with the higher percentage showing the most open fracture.

* A paper by Mr. E. Adamson (Sheffield) read at the meeting of the Iron and Steel Institute.

MODERN EUROPEAN ARCHITECTURE.
HUNGARY.

DESIGN FOR A PUBLIC SCHOOL.—Désiré Csorna, Architect. [From *A Hás.*

Table IV. shows the difference in tests obtained from the transverse test-bars as cast and as machined, indicating a great improvement in the strength of the machined bar. It has generally been assumed that the skin of the test-bar increases the strength, but this investigation has proved quite the contrary, and results in actual practice since these tests were made have confirmed the results.

Whilst making these tests, also, it was thought desirable to see what position of the transverse test-bar gave the best results. The bars in each moulding box were cast in a different position, namely, (F) cast flat with no inclination, (G) cast on edge with no inclination, and (H) cast on edge with an inclination of 3 inches in 3 feet. The results are given in Table V., and do not show that there is any material difference in the bars cast on edge. It was shown by the author in May 1906, in his paper read before the Institute, that the transverse test-bar tested with the "fin" up—that is, the "fin" in compression and the lower part or sounder part in extension—invariably gave the best results.

THE SAN FRANCISCO FIRE.*

MR. PRESIDENT AND GENTLEMEN,—As you will perhaps recollect, the fire at San Francisco was consequent upon the earthquake. On April 14, 1906, at 5.15 A.M., the main shock occurred, followed by subsequent minor shocks. Buildings with walls of masonry and brick sustained considerable damage; chimneys, parapets, gable walls and cornices were overthrown. This being a region subject to earthquakes, a large number of the buildings, especially the residential portion, were of the wood-frame type. There were, however, a number of buildings of ordinary construction, and others again of steel-frame construction, which were intended to be fire-resisting, and it is to this latter class to which I wish more particularly to draw your attention this evening, as showing the effect of the fire on the various materials used, but at the same time it will be interesting to note the effects of the earthquake. Soon after the main earthquake shock numerous fires occurred in the city. These were occasioned in most cases by the collapse of the buildings, and were most of them in the business section.

The fire department, although efficient, and which to some extent had anticipated such a calamity, had the misfortune to lose its chief, who was injured in the earthquake by the collapse of the station in which he was sleeping, and who subsequently died; but the most serious factor in fighting the fire was the want of water caused by the breaking of the water mains by the earthquake shock, and it soon became apparent that a conflagration of great magnitude had started.

For three days and two nights the fire raged with incredible fury, destroying practically the entire business and financial section of the city, where the largest, costliest and most substantial buildings were located.

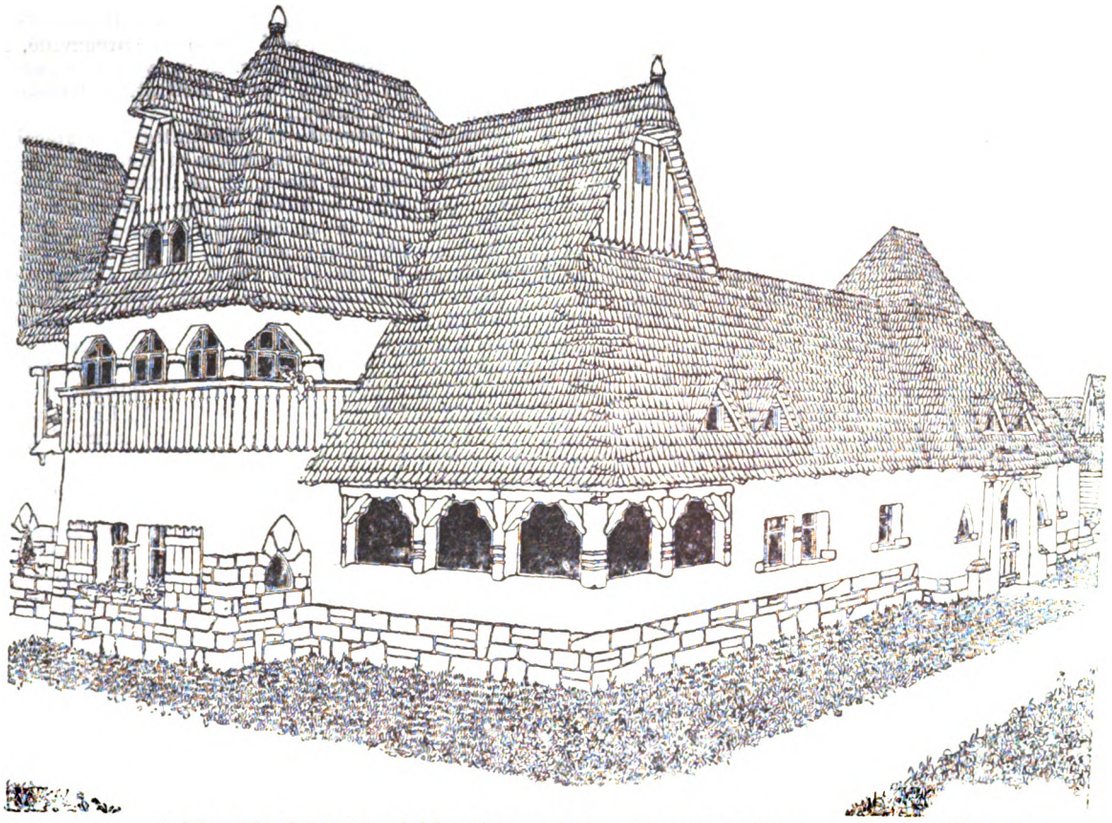
The area devastated by the fire was about 2,831 acres or 4.11 square miles. I want you to mark these figures, as we are considering the effects of the largest fire in modern times, if indeed of any time, and one which throws that of London, Chicago, Baltimore and Boston altogether in the shade; and I think it has for us some useful lessons. When I say lessons, I mean lessons from a constructional point of view, as I do not presume to come here to-night to enlighten you upon details of insurance business, of which I know nothing and of which you are all past masters.

The time has gone by, I venture to think, when it was said we do not care what the construction of a building is; we take the risk as we find it; and to-day a growing interest is taken in the construction of buildings and their surroundings and their liability to combustion both from internal and external causes, and far more attention is being paid to preventive measures by insurance experts than formerly, and this must be my excuse for appearing before you to-night, and I trust what I have to show may be of some service.

Of the general run of the buildings at San Francisco little is to be learned; they burned, collapsed, and there was an end of them; and so complete was their destruction that every scrap of combustible material was entirely consumed and blown away as ash, leaving scarcely a trace behind. But there were in certain parts of the city buildings having more or less pretensions to be fire-resisting, and these may be divided into three types:—

1. Buildings with brick or stone walls carrying floors of fire-resisting construction.

2. Steel-frame buildings with hollow tile floors and partitions.



3. Steel-frame buildings with reinforced concrete floors and fire-resisting partitions.

It is my intention to show you specimens of each of these three types of construction, but it will perhaps be interesting first to note the results of the earthquake which preceded the fire, and also the effects of the fire upon a few of the ordinary types of building, viz. those having brick walls, cast or wrought-iron columns, steel or iron beams supporting

MODERN EUROPEAN ARCHITECTURE.
HUNGARY.

A MIDDLE-CLASS COUNTRY HOUSE.—Joseph Babolnai, Architect. [From *A Ház.*

deal joists and wood floors—a type of building described in the by-laws as Class B.

I shall then come to the three types of fire-resisting buildings to which I wish more particularly to draw your attention, as they are practically the only buildings that remained after being attacked by the fire.

It will be observed in the examples which we have seen that there have been certain good points and certain bad ones or omissions, which, if they had been anticipated, would have in some cases enabled the buildings in question, if not to have come out unscathed, at least to have withstood the ordeal without material damage.

It is by adopting the good, discarding the bad, and supplying the omissions that it should be possible in the future to plan and erect a building which should be actually fire-resisting not only in the mere shell, as we have seen, but with all its internal fixtures and fittings preserved, as it is not much satisfaction to the individual tenant to be told the building remains when perhaps his little all is entirely consumed.

I think we may come to the conclusion that the steel-frame building has justified its existence and shown to the world that it is one of the most stable of all forms of construction. We in England have hitherto eyed it with suspicion and adopted it only in a half-hearted fashion, but I venture to think that it is a type of building we may well introduce, and provide in our Building Acts such rules and regulations as are applicable to this new form of construction.

The glaring omission to protect the exterior openings was the direct and sole cause of the damage and destruction of the interiors in most cases. This is further emphasised by the fact that other buildings of much less pretensions to be fire-resisting have remained undamaged by reason of their window openings having some such protection as wired glass, steel shutters, or other form of fire-resistant properly applied. I would therefore sum up my observations by inculcating the following lessons:—

1. *Protect the openings against fire from the outside.*—This, to my mind, is the most important lesson, and is the key to the position. You will have observed in the views presented that the flames were communicated to the so-called fire-resisting buildings from the outside through the windows and doors. There are now available practical devices to safeguard such openings which may be adapted to the varied circumstances of each case.

2. *Adequate protection to columns and other structural members.*—You will have noted how utterly in some cases the column protection failed, and in others how it succeeded in keeping the ironwork sufficiently under a certain temperature to prevent buckling; both hollow tile and metal, lath and plaster protection seemed to have been wanting when any long-sustained heat had to be endured. I am inclined to the opinion that concrete filled in solidly all round the column right up to the web is the best protection; but whatever it is it must be securely anchored to the column, and there must be no voids, and if brick or tile is used it must be backed up with good concrete or cement mortar filling up entirely the space, and no pipes must be hidden in the protection, as their expansion may endanger the casing, which in its turn will imperil the safety of the building.

3. *Avoid as much as possible the use of refractory materials for façades.*—It will have been seen that granite, marble, sandstone, limestone and similar building stones proved unsatisfactory materials for architectural effects. This, however, will be no argument against their use, for being deprived of the use of these materials, what is an architect to do?

Yet, knowing their inadequate fire-resistance and the better fire-resistance of all clay products, it behoves him to bear the fact in mind and avoid stone where damage might ensue by its employment for columns and piers carrying important points of support.

4. *Select a good type of floor construction.*—It will have been seen that the hollow tile floor construction failed in many cases by the expansion of the soffit causing it to split off and expose the cellular spaces. By a better construction of the tile this may be avoided in future, but the showing in the examples before us to-night has been more favourable to the reinforced concrete, and if this is executed in some form of "cinder" concrete or broken brick and the reinforcement well protected on the soffit by at least 2 inches of material I am inclined to pin my faith to that.

5. *Adopt partitions that do not expand.*—The hollow-tile partitions in the cases before us have not shown up very favourably. The reason is that when heated a large amount of expansion takes place, and bulging and eventual collapse is the result.

Digitized by Google

The metal lath and plaster partitions were also failures, and we are led to fall back upon some form of reinforced concrete or concrete slabs, the thickness varying in accordance with their height. I am inclined to see in this material more satisfactory results.

These, gentlemen, are the principal points I would wish to emphasise; there are other minor ones with which I will not detain you, as I am afraid I have already exceeded my time, for which I must apologise and thank you for the patient hearing you have given me.

ART EXHIBITIONS.

AT the Leicester Galleries there are to be seen the work of three different and differing artists, Mr. W. Lee Hankey, Mr. W. Strang and M. Edmund Dulac. The best known of these is William Strang, A.R.A., LL.D., who shows by fifty examples his versatility as well as his skill, for they include oil paintings, water colours, dry points and drawings. The oil paintings furthermore comprise portraits, landscapes and figure subjects. Mr. Strang has a large following, and it will not be disappointed by the work here shown. Such canvasses as "The Red Fez," "From Cæsar's Camp," "Sir John Fisher," and "The Painter" can only add to an already high reputation; they are full of vigour and individualism. Etching has been a favourite medium of this Scottish artist, and the eighteen dry points exhibited are of great interest.

Goldsmith's "The Deserted Village" is a rustic poem that is crammed full of incidents and suggestions for a painter with an eye for pleasing groups. Mr. W. Lee Hankey has derived some forty subjects from it. There must have been difficulty in selecting the lines, inasmuch as the poem is made up of a series of quickly-succeeding word-pictures, each and all of which would justify the effort of an artist to transfer them on to canvas. Mr. Lee Hankey shows *himself* in a new light as a book illustrator. It would appear to be a profitable outlet for a painter's activities, judging by the number of artists who have undertaken it. The love for picture-books seems to be common to all periods of a person's life; perhaps even it grows with succeeding years and deeper appreciation. This characteristic would doubtless have been encouraged by the unknown poet who said in a sonnet "No nation can be truly great that hath not something childlike in its life of every day; it should its youth renew with simple joys that sweetly recreate the jaded mind." Goldsmith has found a worthy illustrator in Mr. Lee Hankey. The pictures show charm of thought no less than of colour, and the possessor of the new edition of "The Deserted Village" has obtained a source of pleasure that should never grow stale.

In the same room as the pictures inspired by "The Deserted Village" are a series of water-colours by M. Edmund Dulac, illustrating the "Rubáiyát of Omar Khayyam." Both of these works are therefore now offered to the public in a new edition, and they must be intended for adult readers if the price of the cheapest is any guide. Publishers evidently have found glorified picture-books a commercial success. Yet it seems scarcely possible there is sufficient demand for both M. Dulac's edition and for another one that has just been issued by a rival firm of publishers, and at half the price. The illustrations by M. Dulac have something of the suggestion of a mosaic. The Oriental atmosphere has been aimed at and attained. In sharp contrast to these pictures are his "Lyrics, Pathetic and Humorous, from A to Z." These can pretend to appeal to nothing but what is childlike in the nation, for they are nonsensical and irresponsible more than humorous. Each illustration should draw an indulgent smile, though they would probably quickly tire.

There is yet another picture-book to be seen elsewhere, viz. at the Fine Art Society's premises, where illustrations by Mr. Warwick Goble for "The Water-Babies" are on view. There is so much similarity in their two methods that it is impossible not to think of Mr. Arthur Rackham's work. This is rather unfortunate for Mr. Goble, for pleasing though his pictures are, they yet seem to fall short of the sparkling life of the other artist. On their own merits they are delightful. The subjects arise naturally out of the text. It often happens that books are illustrated in such a way as to suggest the artist thought very little about the meaning of the author, but a great deal about the opportunities for displaying his own cleverness. The reverse is the case with Mr. Goble; he has put Mr. Kingsley before himself, and for this alone he is deserving of credit.

OUR CONTEMPORARIES FROM OVER-SEAS

THE *American Architect* devotes an issue to domestic architecture, illustrating a quite English-looking half-timber house at Merion, Pa., by Mr. Horace Trumbauer, a rough-cast and tile-roof house at Bronxville, N.Y., by William A. Yates, also English in type, and two houses in New Jersey by Messrs. Davis, McGrath & Kiessling, which have an Italian flavour.

Deutsche Bauzeitung illustrates a typical modern suburban residence in the house of Herr Schröder built on the Marienburg, to the south of Cologne, and designed by Eugen Fabricius, architect. There is an interesting account of the construction of the grand stands for the racecourse at Grunewald, Berlin, and a fully illustrated article on the new church at Rheydt by Professor Dr. Johannes Otzen.

La Construction Moderne deals with the Rue St.-André-des-Arts in its review of old Paris, and illustrates and describes the new building for the Caisse d'Epargne at Rocroi, of which M. Octave Gelin is the architect. Illustrations are also given of the sculptured monuments to Houdon and Corot by M. Gasq and M. Larche respectively.

The Engineering Record gives an interesting account of the heating and ventilation arrangements of one of the American skyscrapers, the Ford Building, Detroit, an eighteen-storey building occupied as offices.

Stone illustrates the Government Post Office at Winnipeg, the Apthorpe Apartment House, New York, and the People's Trust Building, Brooklyn, as examples of fine work in stone. The latter, of South Dover white marble, is an excellent piece of detail.

COMPETITIONS.

Aberdare. — Sir W. Emerson and Dr. W. Williams, the medical assessor, have made the following awards in the competition for the proposed isolation hospital for fifty-two patients, including administrative blocks, outbuildings, &c.:—First premium (100*l.*), Mr. Edward C. H. Maidman, 31 South Charlotte Street, Edinburgh; second premium (50*l.*), Messrs. Stockdale, Harrison & Sons, and Mr. Howard H. Thomson, F.R.I.B.A., joint architects, Leicester; third premium (25*l.*), Mr. E. Montague Thomas, 37 Old Queen Street, Queen Anne's Gate, Westminster, S.W. The fifty-one sets of designs will be on view until the 12th inst. at the Girls' Higher Standard School, Gadlys Road, Aberdare.

Derby. — A special meeting of the Derby Education Committee was held on Monday in connection with the proposed local competition for schools on the Osmaston Road. A letter was considered from the Derby Architects' Society pointing out that the conditions were not in accordance with the rules of the Society, and that in consequence none of their members or of the R.I.B.A. would compete. It was asked that an assessor should be appointed by the President of the Royal Institute. This suggestion was refused by the Education Committee on the ground that they desired to make their own awards. The Committee finally decided to themselves appoint an architect to prepare the necessary plans.

Eltham.—In the open competition for Eltham Parish Hall the assessor, Mr. R. Lempriere Hesketh, F.R.I.B.A., selected the joint design submitted by Messrs. Moscrop-Young & Glanfield, and Percy J. Waldram, F.S.I., of Buckingham Street, Charing Cross, W.C., who have been appointed architects for the work by the building committee. Sixty-three designs were sent in.

The Bishop of Lichfield has made an appeal for contributions towards the restoration of the parish church at Clifton Campville, a village with an agricultural population of about 400 souls. The church is a fine specimen of the Early English and Decorated periods, with a nave and two chancels, south aisle with a chantry chapel, and north transept with a chantry chapel and priests' room over. It is 128 feet long and 48 feet wide. There is a well-preserved monument of Sir John Vernon, who died in 1545, and his wife in the chapel. At the west end an arch opens into the tower, which with its spire reaches a height of 160 feet, and is a landmark for many miles round. The fabric is much decayed. It has been surveyed by Mr. W. D. Caröe, who estimates the cost of immediate repairs at 3,000*l.* The sum of 1,000*l.* has been raised, and an additional 1,000*l.* was promised by the late Lord Burton if the balance is collected by December 31, 1909.

FORTHCOMING EVENTS.

Monday, November 15.

Royal Institute of British Architects: Paper on "The Planning and Laying-out of Public Places," by Mr. H. Inigo Triggs, F.R.I.B.A.

Liverpool Architectural Society: Paper on "Reinforced Concrete and Steel-frame Buildings," by Mr. F. E. G. Badger, Deputy City Building Surveyor.

Tuesday, November 16.

British School at Rome: Annual Meeting, Sir W. B. Richmond in the chair.

Institution of Civil Engineers: Discussion on three papers read at the meeting on the 9th inst.

Wednesday, November 17.

Manchester Society of Architects: Annual Dinner at the Midland Hotel.

Thursday, November 18.

Illuminating Engineering Society: Open Meeting, and Presidential Address by Professor Silvanus P. Thompson, D.Sc., F.R.S.

Friday, November 19.

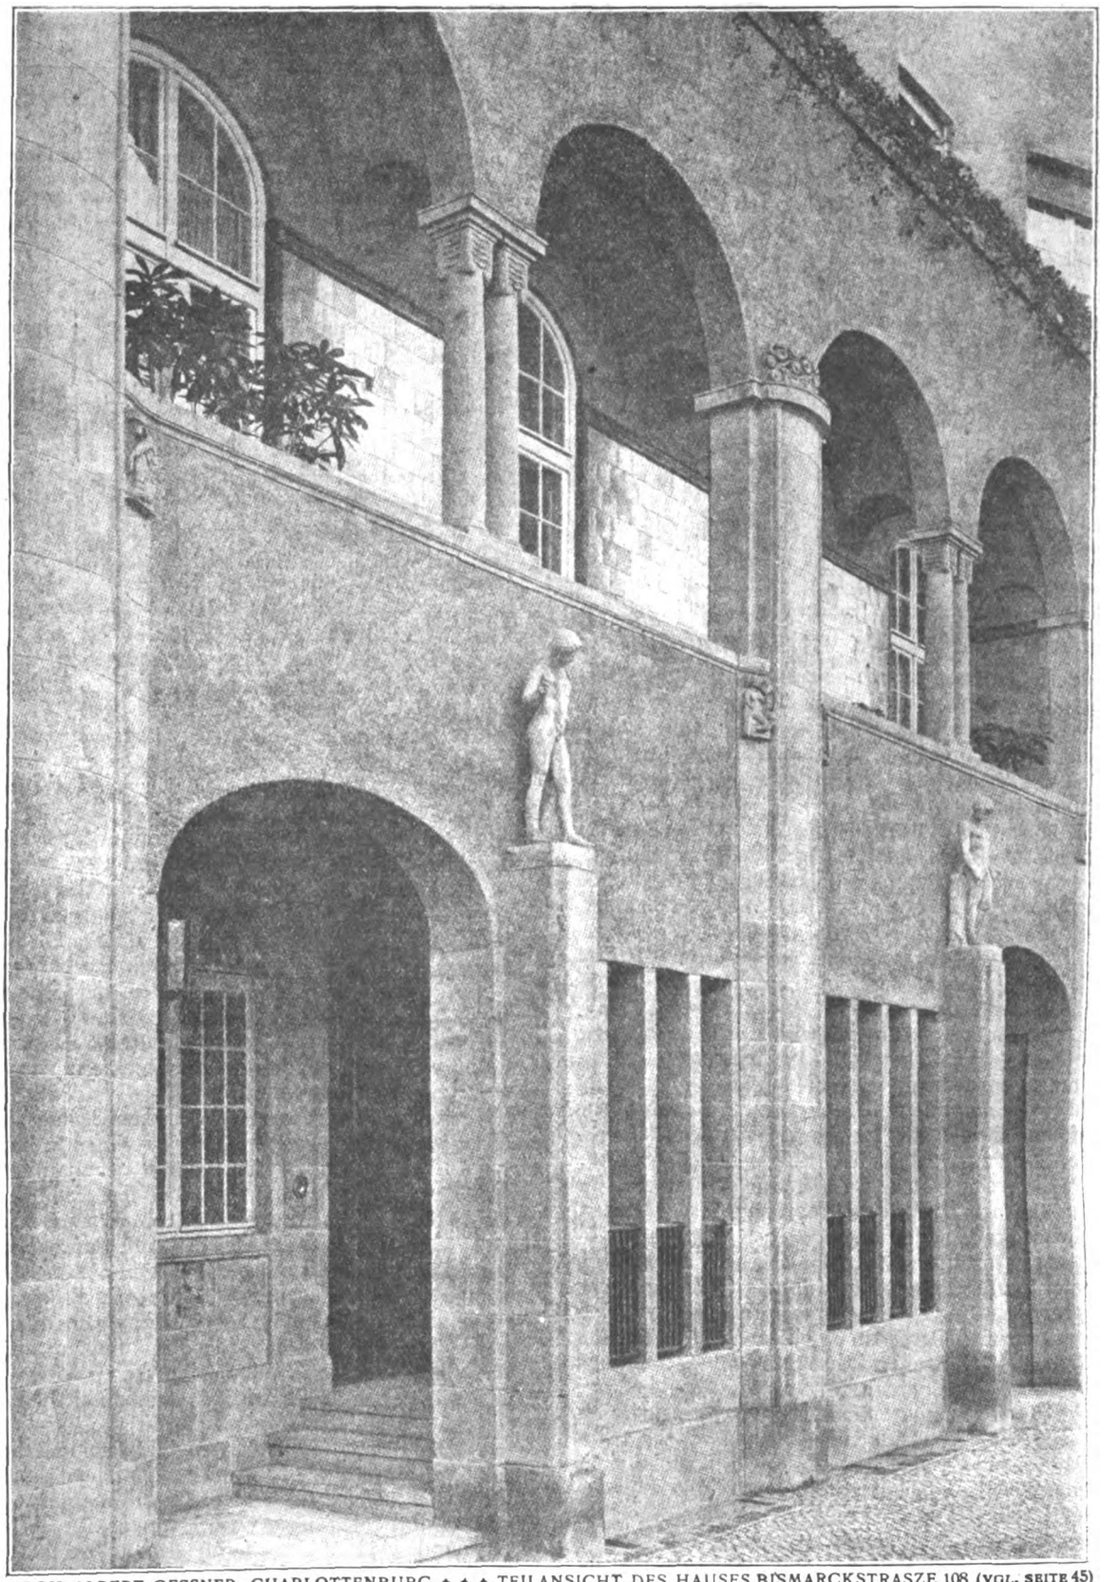
Architectural Association: Paper on "Architecture of the Incas of Peru," by Mr. C. R. Enock, F.R.G.S.

RESIDENTIAL FLATS IN GERMANY.

THE modern tenement house or residential flat in Germany has received at the hands of present-day architects a very great amount of consideration, and undergone a development in planning quite as remarkable as the modified form of the "new art" movement has produced in grouping and detail.

An excellent view of this latest development both in planning of flat dwellings and in the modern German architectural treatment of grouping and detail may be obtained from a newly published book * by Herr ALBERT GESSNER, of Charlottenburg, an architect who has himself designed and carried out some of the most notable modern residential flats in Berlin. Although some of the author's buildings are illustrated, this book should not be considered a "one-man show," as the examples with which it deals embrace the work of thirty-three other architects, or firms of architects, and are chosen from all parts of Germany. Naturally most of these examples are from Berlin, or from the suburbs of that city—Charlottenburg, Friedenau, Gross-lichterfelde, Halensee, Pankow, Schöneberg, Steglitz, Südende, Wilmersdorf—for it is in the capital and its environs that the most striking developments of the German tenement house are to be found.

The author naturally treats of the necessity for and the advantages of the flat system of dwellings for large towns as they appear to the mind of a German architect, advancing the argument that the growth of cities necessitates the concentration of dwellings, and that this implies buildings of several storeys from which follows the flat-dwelling. Now how far is this argument tenable? The concentration of dwellings can be as stringently effected by the close packing of houses in vertical strips as in horizontal strips, and the density of the concentration is only limited by the demands of hygiene for a certain minimum proportion between building and air-space. If buildings are allowed to be high, healthy conditions can only be maintained by an increase of space between them, a fact clearly recognised in the preparation of the present London Building Act, so that as regards concentration there is, *prima facie* and presuming a correct relation to be maintained between building and air space, nothing to be gained by building high buildings with large spaces between them rather than low buildings closer together. Indeed, it is quite open to question whether, for hygienic reasons, it is not necessary that high buildings should be further apart in proportion to their height to maintain equally healthy conditions. Thus if houses 40 feet high are healthily placed 40 feet apart, the same proportion of cubic space would require houses 80 feet high to be placed 80 feet apart, but it is very doubtful if the inhabitants of the ground floor of the 80-feet houses would get as much fresh air as those in the 40-feet houses.



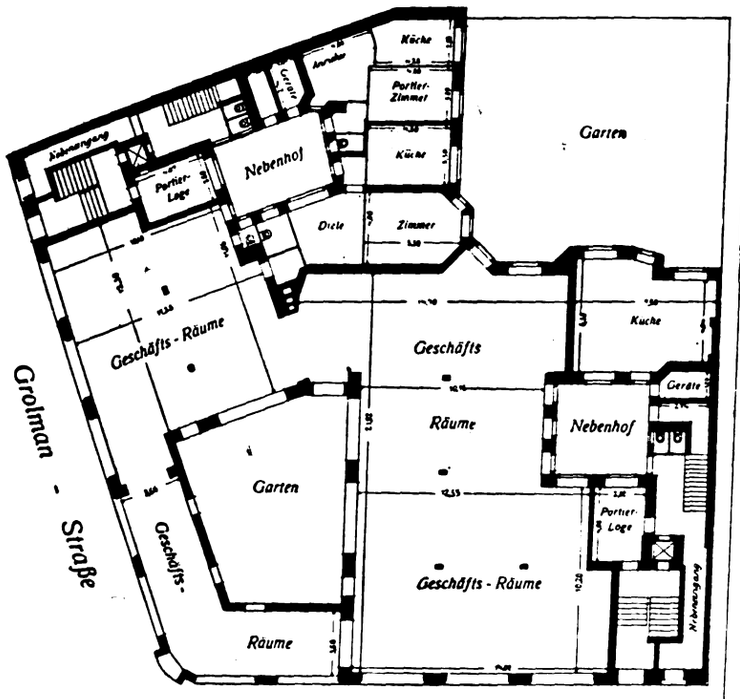
An advantage accrues to the high houses in their relation to ground rent when the necessary greater air space is provided by streets, parks or other public spaces for which ground rent is not paid, but if each house has to provide its air space from ground for which rent is paid, or which is its own curtilage, there is obviously no advantage in the high building over the low one in respect of economy of land. Nor as regards cheapness of building is there, as a general principle, any advantage to be gained by the lofty building. It is true that the roof, which is non-paying space and construction, covers a larger amount of accommodation, but against this there must be set the increased cost of the walls of the high building by reason of their greater thickness and the loss of floor area that they entail.

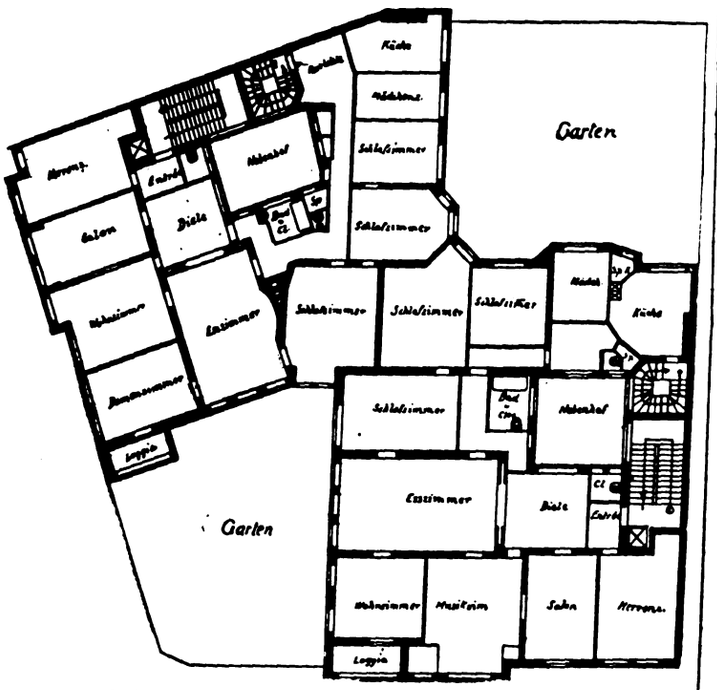
We must therefore seek for some benefit in other directions to justify the preference for dwellings in horizontal strips as favoured on the Continent rather than in vertical strips, as in our own country. The flat dwelling, when skilfully planned, has the merit of compactness and avoidance of stairs within the residence itself, thus economising labour in cleaning and waste of space in non-useable components. When the occupants have reached their flat they have no stairs to mount so long as they remain at home. The fact that the desire to avoid running up and down stairs is largely a factor influencing the preference on the Continent for flats is shown by restriction of the height of tenement houses to three storeys in the case of small dwellings of three or four rooms and kitchen, and the avoidance of greater height except when the scale of the house is sufficient to pay for the cost of lifts. Judging from the examples illustrated in the book before us, it may be taken as a general rule that in modern German tenement houses, ground, first and second floors are alone expected to pay unless a lift is provided. Cellars and attics in the roof for storage may be an accompaniment, but virtually the smaller houses are no more than three storeys high.

Other advantages of flats which have recommended them to Englishmen as well as to Germans are the simplicity of paying with one's rent for rates, taxes, water and other etceteras that bother the householder. In some of the German modern tenement houses heating is supplied from a common source and paid for as part of the rent, an arrangement that much reduces the stringency of the eternal servant question. Not frequently but occasionally a restaurant is included in a block of German flats, but as a rule the residences are planned to be self-supplied in the matter of meals.

* "Das Deutsche Miethaus." By Albert Gessner. With 220 illustrations and plans. (Munich: F. Bruckmann A. G. 8s.)

Digitized by Google





ARCH. ALBERT GESSNER, CHARLOTTENBURG ◆ ◆ ◆ TEILANSICHT DES HAUSES BISMARCKSTRASZE 108 (VGL. SEITE 45)

German architects of the present day in their designs for flat-residences or tenement houses have made strenuous efforts to get away from the barrack-like monotony of plan and elevation that has seemed to be during the last century an inseparable accompaniment of this class of dwelling. Of loggias, balconies, oriels and bays some or all are provided on each floor and for every suite, and by counter-changing these features variety and differentiation are given to similar suites on different floors as well as to the elevational treatment. The balcony or its modern German development, the loggia or recessed balcony, is regarded as so important an accessory of the flat that the author lays it down as a general principle that the kitchen should always have a balcony. As the German town-dweller, unlike the Frenchman or at least the Parisian, is a garden-lover, the modern blocks of flats in Germany are usually planned so as to include within the curtilage garden-courts and frequently small roof-gardens over lower floors, a device that has had exemplars in our own country.

It is needless to say that this book, being an exposition of the work of the advanced school of German domestic architects, the external architectural treatment follows the latest development of the "new art" movement, always interesting if not perhaps what we may consider uniformly successful.

NOTES AND COMMENTS.

THE President of the Society of Architects was fully justified in his opening address last night in laying stress upon the overwhelming majority of opinion amongst architects generally in favour of registration, and in his deduction that the policy recommended for adoption by the Registration Committee of the Institute is not one with which the general body of its own members is in sympathy. The position of affairs within the Institute appears to us to be this:—The majority of members, although in favour of registration, recognise that the minority includes many of the foremost architects and artists in the profession; that it embraces, in fact, all architects who are members of the Royal Academy, and therefore all those who aspire to become members of that body. It is also recognised that those architects who have attained the front rank have done so not only by reason of their ability as artists, but by their ability as men of business, and it is presumed that those who have managed their own business successfully can manage well the business of the Institute. Therefore when the scheme of Licentiates is brought forward and the ideal of universal inclusion of all real architects within the ranks of the Institute is propounded by the minority, the majority, however dubious they may be as to the success of the scheme or the attainment of the ideal, have sufficient tolerance to give the minority a chance. If the minority fail, as we agree with Mr. BOND in thinking they will fail, in approaching anywhere near the ideal, then we feel sure the voice of the majority will be heard in no uncertain tones insisting upon some such measure as the Society of Architects has been advocating for the last quarter of a century.

A GOOD opportunity of viewing some highly interesting relics of old English architectural art and crafts is afforded by the sale, which will take place next week, of the collection belonging to Mr. JOHN FORD, F.S.A., Deputy-Lieutenant of the County of Middlesex, at his house, Old Park, Enfield. There in the gardens are life-size lead figures and marble vases, stone ornaments from WREN'S City churches, palisading from the old South Sea House, iron gates and marble vases from the old palace at Theobald's Park, stonework from old Burlington House, Piccadilly. Inside the house are old English silver and pewter, and furniture by English cabinetmakers of the seventeenth and eighteenth centuries.

THE annual report of the Council of the Manchester Society of Architects is of a very satisfactory character. The membership has increased, and the accounts show that there is a balance of income over expenditure of 45*l.* 18*s.* 5½*d.* The activities of the Society are in many ways notable. It maintains a club for members, with a billiard table and billiard handicaps, and makes a profit out of its catering of a quite useful amount. In this respect it sets an example to the Royal Institute. It does for its students what the Architectural Association does for London students. It takes an active part in fighting the battles of architects in its own district and in bringing pressure to bear upon local authorities in matters of professional interest. The following papers are arranged to be included in the syllabus for the current session:—"Ancient Lights," by P. M. OLIVER, B.A.; "Workmanship," by HENRY WILSON; "Concrete and Concrete Tests," by A. E. CORBETT, A.R.I.B.A.; "Truro," by Professor S. H. CAPPER, M.A., A.R.I.B.A.; "Town Planning," by Professor S. D. ADSHEAD, F.R.I.B.A.; "Draughtsmanship," by PAUL WATERHOUSE, M.A.; "English Castle Building," by J. T. HALLIDAY, A.R.I.B.A.

THE London County Council has agreed to grant to the University and City Association a lease of Crosby Hall, when re-erected by the Association, for a term of 500 years at a ground rent of 1*l.*, and the agreement provides that the Hall shall be open to visitors daily from 2.30 P.M. to 4 P.M. from October 1 to March 31, and from 2.30 P.M. to 5 P.M. from April 1 to September 30, and that, in addition, when students are in residence the Hall will be open on three days a week from 11 A.M. to 12.30 P.M., and during the vacations from 11 A.M. to 12.30 P.M. daily, and during the long vacation (July to October) from 10 A.M. to 12.30 P.M. daily. The Association will have power to close the Hall temporarily for the purpose of exhibitions on giving notice in the public Press. As the foundations have now been put in, it is probable that the old Hall will be re-erected and completed before very long.

THAT restoration and repair may be too conservative in the case of ancient buildings has been shown by the recent fall of a portion of the Norman string course

Digitized by Google

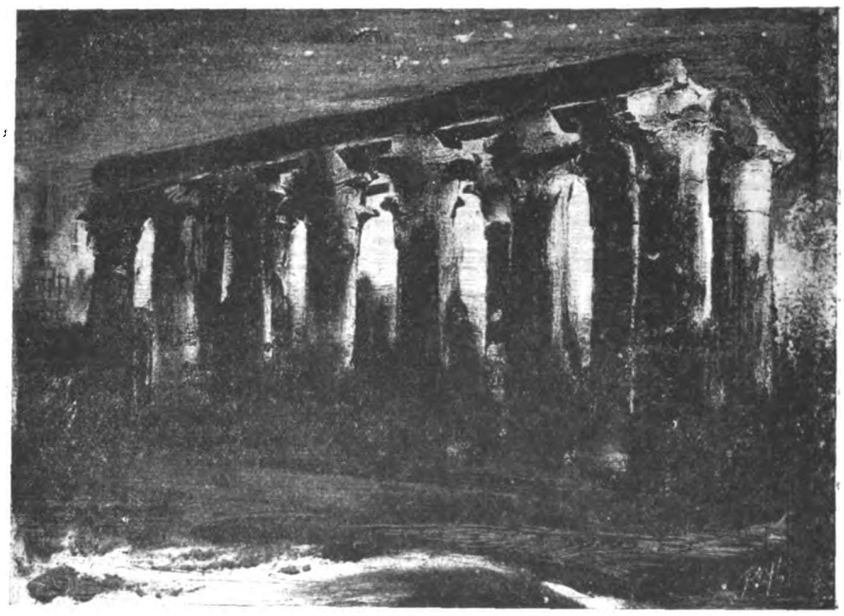

FIG. 44.

of the south tower of Exeter Cathedral. Dean MARLBOROUGH, in a letter to the *Western Morning News*, expresses the fear that the restoration was not sufficiently drastic, and that in their anxiety to preserve as much as possible of the old stonework the repairers have stayed their renewal too soon. This is one danger that always threatens those who have the care of ancient buildings, and postponement of repair in deference to the views of certain enthusiasts may very readily lead to injury to life and limb and to irremediable damage to the fabric.

ARCHITECTURE: ITS TRUE PRINCIPLES.—XXII.

By R. OWEN ALLSOP.

CLIMAX.

OUR business being with the general massing of buildings, we deduce from the foregoing considerations that concentration as a principle leads to *compactness*—as a rough-and-ready term—in grouping.

We continually employ the expression a "straggling" building, as we also commonly talk of a "rambling" plan. The prime cause of both these delinquencies in architectural composition is diffuseness, and that is *want of concentration*.

The loss of this compact character is seen very plainly in the outline of buildings. A good outline requires that the several features shall be well *bonded together*. Only in this way is unity gained. The straggling outline is the outline of a conglomeration—the sky-line of part of a town or city—picturesque itself, but wanting in any relativeness to the whole composition—wanting in unity.

The eye rests on the position of concentration. Plain wall surface is called a "relief"—rightly enough in the sense employed. But plain surface such as a breadth of brick-work or monotonous plaster of itself affords no relief *to the eye*. The eye rests on a point—large or small. It wanders about the plain surface seeking, in nautical language, somewhere to "come to an anchor," for a time. The action of the eye may be exactly compared to the wanderings of the bee—it ever moves restlessly from point to point until the eyelids are closed. The flight of the bee is from flower to flower—from point to point—and consideration will show that the eye is equally restless. What "plain wall surface" is to the eye, the intervals between flower and flower are to the bee. If it be thought that this is not so, it may be that it is considered that we can look fixedly at a plain surface and do habitually do so. It will, however, be found that the mind is here either in a state of thought-abstraction or that a half state of catalepsy is concerned. The eye, then, moves from object *to object*, and highly concentrated and condensed parts of the design are its actual resting-places. These are the halting places—the flowers—and the contemplation affords either pain or pleasure, or, it may be, neutral emotions of varying grades. The taste of the eye is for infinite variety—either that or total oblivion in sleep; and no voluntarily operated organ of the body compares with the eye in ceaseless and restless activity.

The considerations we have just made are full of the widest import in æsthetics. If the eye seeks infinite variety and change, it can be understood how it must be always averse to rigid confinement such as by being led to run along harsh lines as hard, unbroken shadows; and one appreciates better the theory of the Doric guttæ. The eye doubtless delights in curves even if the mind has a taste for ruggedness and angularity; any exception to the rule being readily accounted for by considering the mood of the beholder—a reflex action of the brain. But there is no more home in the desert than rest for the eye on plain, monotonous surfaces. The "relief" to the eye is not plain wall-surface, but the more enriched object that it flanks or bounds. The painter talks of "leading the eye" along a picture. The same consideration must be shown in architectural design.

Naturally, in viewing large and distant compositions our attention (the eye) is attracted by the several component masses which we proceed to examine. There is, however, the well-called *coup d'œil*—the whole composition—when we are at such a distance as will give us an embracing view. Here we must be chiefly impressed by the most dominant mass or masses; but, in the case of views at a moderate distance, the relative position of the component features—towers, domes, or otherwise—is what concerns the critical spectator; and that arrangement will be the most pleasing that least resembles equality and mathematical division.

Inequality, with unity, is the aim sought—it will be found on close analysis of the questions at issue. It so happens, therefore, that that concentration of work which is to be considered in matters of façade making must also be the prime factor in composing whole masses. The variety ever sought by the eye is thereby afforded.

The "one-principal-object" theory of composition—a sound theory—must therefore enter into the question of general outline. There must be no diffuseness—the

Digitized by Google

outcome of the concentrative mind must be evidenced as concentration to the beholder. The reverse effect is required to that of the eye "jumping" round the teeth of a cog-wheel—*i.e.*, passing, on a tour of inspection, from tooth to tooth. This, to the eye, is worse than aimless wandering about a monotonous surface. One definition of the picturesque might fairly be no more elaborate than that it is variety offered to the eye, and the truth of this is a literal one; for variety is a wholly comprehensive term. It embraces variation on the variation to an infinite series.

Why, then, the principal object? Because variation is between extremes, and the greater the extreme the greater the variation. This necessitates plainly one extreme—in size and weight and importance. The extreme is therefore the dominant object—the important centre—the theme of the theme; for art knows nothing of dead-level equalities.

Without this arrangement of concentration or condensation, the eye would be restlessly revolving round and round the several monotonies of the equal-featured composition. With the concentrated feature, or the dominant object, we are offered a rallying point and a powerful arrester of the attention.

(To be continued.)

THE SOCIETY OF ARCHITECTS.

AT the meeting of the Society of Architects held last evening, the President, Mr. George E. Bond, J.P., delivered the following address:—

In entering upon the duties of President of the Society of Architects for a second year, my first desire is to express my warm appreciation of the honour conferred upon me by my fellow members, and to assure them that I shall endeavour by careful and painstaking attention to the duties of the office, to merit this renewed token of their confidence.

Never before in the history of the Society have the responsibilities of management been so great as they promise to be during the ensuing session, but I am confident those responsibilities will be accepted cheerfully and borne willingly by the very able and energetic body comprising officers and members of Council now charged with the direction of the Society's affairs. I sincerely hope that at this time next year your President will be able to congratulate the Society upon the consummation of the Council's efforts to provide for its use a permanent home, with adequate and suitable accommodation to meet its ever growing needs. The provision of such a home will, I am sure, prove to have been a wise and progressive step in the evolution of the Society.

The twenty-fifth annual report of the Society has been in the hands of the members during the last month, and its perusal must have given great satisfaction, for though it records nothing of a startling nature it shows a year of steady and continuous progress.

Notwithstanding the very general depression in the building trade, which necessarily affects adversely the position and prospects of architects, our balance-sheet is a favourable one, and the work of the Society is evidently appreciated by the profession generally, from the fact that sixty members, two honorary members and forty-two students have been added to the register during the past year, and that, after allowing for deaths, resignations and removals (which, owing to the depression have been abnormal), there is a net increase of twenty-five. Present conditions with regard to membership in another architectural body justify me in predicting a much larger increase during the ensuing year to the Society.

There are several points in the report to which I should like to direct your special attention, the first being that in connection with the students' section.

I am confident that every member of the Society must feel, that even were he unable to secure any personal advantage from his membership, his subscriptions to the Society are amply justified by the fact that they enable the Council to encourage so many of the younger members of the profession to more fully equip themselves for the proper performance of their future work. Upon the students of to-day will devolve the duty of maintaining the honour and dignity of the profession in the future, and anything we can now do to encourage *esprit de corps* among them, to check the present selfish spirit of every man for himself, as exhibited by the steadily growing evil of scheming, and unfair and indecent touting for architectural work, must ultimately tend towards maintaining that honourable conduct which until recent years was one of the distinct characteristics of the architect. I submit that the present organisation of our students' section, under which it elects its own chairman, secretary and committee, holds distinct meetings and makes its own arrangements for sketching tours and social functions, is eminently calculated to secure the object we have in view.

In no other section of the Society's work has so much progressive development been achieved, the past session having been from a practical point of view the most successful one we have known. With Mr. Emerson as its chairman, and Mr. Margary as its indefatigable hon. secretary, four very instructive sketching tours to interesting architectural centres were arranged, and largely taken advantage of by the students, who in each case were accompanied by members of your Council, some of the results of which we had the opportunity of seeing on Monday evening last at St. Bride's Institute. The visits to the Building Trades' Exhibition, the London timber docks, and to Messrs. Lawrence & Sons' brick and tile works at Bracknell, were also largely attended by both students and members, and without doubt added considerably to the knowledge of all taking part.

On the other hand the correspondence classes, conducted by Messrs. Bartlett and Mead have hitherto been but a moderate success. Your Council, however, by offering prizes to those securing the best positions in the first, second and third years' courses respectively, hope to attract a class of correspondents, earnest and conscientious in their desire for improvement in the practical details of their work.

Of the various competitions, that for the travelling studentship, as usual, attracted the larger number of competitors, and the submission of some really excellent designs for a secondary school, all of which were exhibited in this room, and subsequently at Birmingham and Cardiff, where they attracted a great deal of close and critical attention, and received high commendation. You will agree that this section of the Society's work deserves all the encouragement your Council can give it. No scheme of the kind can be perfected at once, but its development in a comparatively short time from a small and unimportant beginning, to its present position, leads one to hope that within the next few years we may be able to discover means of further developing its sphere of usefulness.

Next, I would refer to the question of new premises. The continually increasing work of the Society necessitated the formation of a larger General Council, and more frequent meetings of the various standing committees, with the result that our present accommodation was found to be utterly inadequate; the library has very considerably outgrown the space we are able to allot to it, the room in which it is housed is also our only available committee room, and frequently at the practice committee meetings there is not room round the table to seat the members who attend, and of course, an important committee cannot perform its duties to the best advantage under such conditions. Acting, therefore, upon the advice of a sub-committee appointed for the purpose of inspecting various premises offered, your Council has entered into an agreement for the lease of No 28 Bedford Square, where, subject to some alterations, accommodation already exists for all the Society's present needs, with the further advantage that there is at the rear a space sufficient for the erection of a large assembly hall, plans of which have already been prepared. Your Council, however, feels that after meeting the liabilities incurred by the purchase of the lease, and the execution of the necessary alterations and repairs, the funds available are not sufficient to warrant further expenditure upon the erection of the hall at the present moment.

Mention is made in the report of the Architects' Benevolent Society, and as your representative upon its Council, may I commend it to your notice; it is doing a good and necessary work in an unobtrusive manner, and is fully deserving of your generous support. It is to me a matter of regret to find in its register of subscribers so few names of members of this Society. May I hope for amendment in this respect? As a Society, we only subscribe five guineas per annum. This is, I submit, not very creditable to us, and I sincerely hope to see this amount considerably increased during this session.

Now, gentlemen, I must refer to that hardy annual, Registration. Although it has not been possible to have our Bill read in Parliament during the past year, all supporters of that far-reaching measure may congratulate themselves

Digitized by Google

upon the fact that it has now passed beyond the academic stage, and entered the region of practical politics. This has been clearly demonstrated during the year by the large share of attention accorded to the subject at professional meetings, and by the professional journals both at home and abroad. We are able to record the first legislative success, in the cause of the registration of architects, which has been achieved in the British Empire; and we offer our hearty congratulations to our Transvaal brethren upon the consummation of their desires in this direction.

Early in the session your Council forwarded to the South African Branch of the Society a sum of 50*l.* as a donation towards the cost of promoting the Bill, which was duly introduced in the Transvaal Parliament in June, and referred to a select committee; its second reading was only opposed by some three or four members, whose remarks with reference to its working demonstrated clearly that they had not understood its provisions, and it ultimately passed the third reading without opposition. A Bill having the same object in view is now being prepared for submission to the Parliament of New South Wales, and as it is receiving the practical support of an united profession, we trust it will meet with similar success.

Three States in America, viz., California, Illinois, and New Jersey, already have statutory license or registration, and that its general working is satisfactory is evidenced by the manner in which leading practitioners have expressed themselves with regard to it; the general opinion being that the public is benefited by the rising standard of professional training and technical knowledge; and that the proper practice of the architectural profession is just as essential to the public welfare and safety as that of any other profession.

Coming nearer home, let us consider what has been done here during the year.

It will be within the recollection of all that in April last, *The Builder*, with a certain amount of success, secured a plebiscite on the question of registration, sending out some 5,500 stamped post cards for replies to definite questions. According to the first announcement 2,484 were returned, showing that half the practising architects in the kingdom were either too apathetic, or too uncertain about their own convictions, to write one word on a stamped post card; some qualified their replies; but the net result was that 2,113 direct votes were recorded in favour of registration, against 264 direct negatives, almost exactly eight to one in its favour; subsequently ninety-nine further replies were received, divided again in about the same proportion, and this practically agrees with the result of a similar plebiscite instituted by your Council some six years ago.

In their attempt to secure the opinion of the profession, the proprietors of *The Builder* sent out with the post cards 5,500 free copies, containing a leading article with quotations from our Bill as last printed, with comments thereon.

With your permission, I should like to consider this article in detail; firstly, because it contained arguments for and against the Registration Bill, to guide the reader in the exercise of his vote; and secondly, because the article with its quotation from the speech of Mr. E. T. Hall represented very fairly and fully the expressed opinions of all opponents of the measure with whom I have spoken, and was evidently intended to demonstrate the superiority of the policy advocated by the Institute. Therefore, in meeting this presentation of the subject (which I think was stated as impartially as we could reasonably expect, from one whose general conclusions proved clearly that he was not in sympathy with either the Bill or its promoters), we may assume that we are dealing with some of the strongest points of our opponents.

Firstly, let us note, the writer did not advance a single argument against the central principle of the Bill; but he made one very significant admission, when he said:—

"We recognise that while the reasons in favour of the measure are mainly practical ones, the objections to it are mainly objections of sentiment."

And referring to the clause which reads as follows:—

"An applicant for admission after the passing of this Act must not be less than twenty-one years of age and must, except in cases hereinbefore and hereinafter mentioned, have served as apprentice for not less than three years with a registered practitioner, or practitioners, and have passed such examination or examinations as the General Council shall authorise,"

the writer says:—

"That is the best provision in the Bill, and could have nothing but a good effect."

But that is our Bill; that is the principle for which we are fighting; every other word, every other line, contained in the Bill is but subsidiary to the carrying out of that principle, and if the effect of its universal adoption could be nothing but good, I ask why it is so persistently opposed by those who profess to have the welfare of architecture so much at heart—by the very select band of architects which the leader writer of *The Builder*, in a subsequent article, ventures to call the makers of English architecture of to-day?

Following the train of thought induced by a careful reading of his adverse arguments, we can readily recognise two of the sentimental objections both he and other opponents have to the measure; the first being, that under its provisions certain powers and privileges would be handed over to the suggested General Council, which he and they think ought to be exclusively vested in the Council of the R.I.B.A.; and the second, that Parliament following its usual procedure with regard to the creation of monopolies, would protect the interests of all those persons who, though not possessing the usually recognised qualifications, shall be at the time deriving an income from the practice of some of the lower forms of work usually performed by an architect; with the result that in any Registration Bill which it is possible to pass through the House of Commons, conditions would be imposed compelling recognition of the right of such persons to have their names registered in the same list with duly qualified architects, and thus lowering the prestige and status of the profession. In support of the position thus taken up he quotes Mr. Edwin T. Hall, chairman of the registration committee of the R.I.B.A., who in a speech to that committee said:—

"The object was to collect into the R.I.B.A. all qualified architects, and then to apply to Parliament to give them a legal diploma and legal titles. When this had been brought about, it was decided, and it was recommended, that in future admission should only be by a compulsory training upon lines to be settled by the Institute, and by compulsory examinations. When this was done with all the accompanying publicity which of necessity would arise from it, it was felt that those who were outside, the unqualified men, might be left alone; people might go to them just as they now go to medical quacks, but in no other sense would they be in the course of a few years a factor that need be taken into account. The advantages of this scheme were generally felt to be that instead of giving titles to unqualified men, and so to that extent lowering the immediate prestige and status of the profession for a time, they could proceed at once on an upward course."

The writer of the article considered this "a very reasonable and sensible position, and worth the serious consideration of the profession."

We may fairly assume that Mr. Hall's remarks may be taken as the concentrated essence of the opinions of all his supporters on the Committee, opinions arrived at after serious discussion, and that it was possible after any kind of discussion to arrive at and deliberately express such opinions only proves how, by continually and doggedly looking at a subject from one point of view, our mental vision may become contracted to such an extent that the perfectly obvious from other points is unseen and unrecognised. Of course this may apply equally to ourselves.

But let us give the statement the consideration the writer suggests it deserves. "The object was to collect into the Institute all qualified architects." This implies, of course, that the Institute is the proper body to be entrusted with the solution of this serious problem, and I am sure all our sympathies would run in that direction if only the Institute would rise to the occasion and adopt some practical scheme of compulsory training and examinations *for all*.

Well, the object is to collect into the Institute all qualified architects; but how is it proposed to attain that object? We may assume that, at a moderate estimate, there are at least 3,500 practising architects in the kingdom who are not direct members of the Institute, the majority not being members of any society; and of this number, we may safely estimate, at least 500 possess qualifications and social status equal to those of the average Fellow, many of them being men of long and honourable standing in the profession; and until quite recently such men had the opportunity of submitting themselves as candidates for the Fellowship class, and after satisfying the Council they might (subject to the will of the junior members) have been duly elected members with all the prestige and privileges of that class, but apparently these privileges were not a sufficient inducement; at any rate, the fact remains they have not joined, nor can they now join as Fellows. But

Digitized by Google

the Institute has a broad-minded desire to admit all *bona-fide* architects within its communion. Yet, where the Fellowship class proved an insufficient inducement, they are to be collected into the Institute by being cordially invited to join a third-class rank, mere hangers on, paying smaller fees, and having fewer privileges than the junior class. Because they did not take timely warning and rush in before the gates were closed they must henceforth be content to occupy a lowly position, where they can be patronised by their juniors and in many cases by their assistants; is it possible to imagine a more absurd proposition? No self-respecting man could possibly join under such conditions unless he were compelled by statute, and as this is not proposed he will simply continue on his present lines, either as a respected member of some other society or as an unattached member of his profession.

So we may fairly conclude that as this large collection is going to be made *before* applying to Parliament for legal diploma and titles, Parliament will not be troubled in the near future.

But let us for the moment assume that it is possible to collect all qualified architects under such conditions, and that subsequently the Institute shall be successful in its application to Parliament. What would then be the position? Future admission would only be by compulsory training and examinations, upon lines to be settled by the Institute. This we quite agree with, and the question naturally occurs to one, why, if such training and tests are necessary to protect the status of the Institute and its members, they would not be equally beneficial if applied to the profession as a whole? One of the stock arguments of our opponents is that compulsory training and examinations will tend to stereotype art and kill individuality. But if these are essential parts of the policy of a body which places art before all other considerations, how can the Council of that body argue with any degree of consistency that such principles when promoted by another body would be productive of evil?

Then we are told that "all those outside the unqualified men may be left alone." The idea being that few people would resort to them in future. Does not such an expression of opinion prove decisively that the gentlemen who had the matter under consideration had not grasped, even in an elementary manner, the conditions which many provincial architects have to face and about which they are complaining?

Even in a part of my own district it will be safe to assume that two-thirds of the buildings erected have been carried out without the intervention of a recognised architect. In one year alone, as arbitrator appointed by the Court, I had to deal with three distinct cases, the aggregate costs of the buildings being 2,100*l.*, where the plans and specifications had been prepared by writers in H.M. Dockyard, and although in each case the building owner suffered pecuniary loss, such warnings were disregarded by the public and the same conditions continue unabated.

I recognise, of course, that difficulties would occur in dealing with such persons under our Bill as drafted, but not, I am sure, to the same extent. The concluding statement contained in the quotation from Mr. Hall's speech is:—

"The advantages of this scheme were generally felt to be that instead of giving titles to unqualified men, and so to that extent lowering the immediate prestige and status of the profession for a time, they could proceed at once on an upward course."

How is it possible to proceed at once on an upward course when it is proposed to leave unchecked the large army of parasites which is eating its way into our legitimate practice and compelling well-trained and qualified men, who must practise to keep the wolf from the door, to drop their dignity, slip into the arena and fight that army on its own terms, accepting the reduced fees and degrading conditions now frequently imposed both by public bodies and private clients? What cares such an army about "the accompanying publicity which would of necessity arise" from the Institute's action? The only way to check its growth and prevent further aggression is by imposing statutory tests of qualification.

With regard to the sentimental objection of giving titles to the present unqualified men, what practical difference can it make to the position? Such men now assume the titles, and they are recognised and resorted to by the building public, and are at the same time included with R.A.'s, F.R.I.B.A.'s, and A.R.I.B.A.'s in the various professional lists and directories; in fact, it is the objectionable persons who generally figure most prominently in such lists and whose names are also found in other directories and lists used by the public, but tabooed by the profession. One case I know of where in a well-known and professionally recognised directory arranged in districts and in alphabetical order, the first name in a certain place is that of a man who combines the practice of architecture with his business as a dealer in second-hand furniture; he occupies a double-fronted shop, the windows being filled with odds and ends of old furniture, and prominently on the centre of the glass, in china letters, I am able to read So-and-So, architect and surveyor. What can we possibly have worse than this in the immediate future, even under a thorough-going Registration Bill? Were such a Bill to pass to-morrow, then the conditions existing to-day would be the very worst, for it is my honest conviction that not one in ten of these objectionable persons would apply for registration. Thus the first list published under such an Act would be a very considerable improvement upon the lists now existing, and thenceforward further improvement would be effected gradually and continuously as a result of the removal of undesirables by the steady but persistent hand of time—compulsory tests preventing their further development.

Let me now summarise the arguments; we may then consider from a practical point of view how our position is affected by these later developments.

Firstly.—Considering the Registration Bill, we are told with regard to the suggested composition of the General Council, "The principle of selection is very fair and there is nothing to criticise in it."

Secondly.—The clause dealing with compulsory training and examination of future candidates for admission to the ranks of the profession (and this, I submit, is the soul of the Bill) is pronounced to be "the best provision in the Bill and could have nothing but a good effect."

Thirdly.—No arguments were advanced against the general principles of the Bill, but only against some of its details, and these I am sure we are willing to reconsider if our central principle is accepted; much was made of suggested difficulties in its administration in the event (impossible according to the writer's prediction) of it becoming law.

Otherwise we were told "the reasons in favour of the measure are mainly practical ones, while the objections are mainly objections of sentiment."

With regard to the alternative suggested by the Registration Committee of the R.I.B.A., I would say it is based upon the assumption that it is not only possible, but extremely probable, that all qualified architects now outside the Institute will within one year join that body. Join under conditions which imply that as undesirables they are as a class to be allowed to die out, and that they voluntarily acquiesce in this recognition of their inferiority, and are therefore willing and anxious to take advantage of the Institute's gracious permission, allowing them to practise for the time being as members of a lower grade upon the distinct understanding that they shall have no effective voice in its management. When I remember that some of the most respected members of the profession do not at present belong to any professional organisation, it seems incredible that there is now in existence a body of gentlemen whose sense of humour is so undeveloped as to be unable to realise the ludicrous nature of such a proposition.

As their further propositions are contingent upon the realisation of their wishes in regard to this, I will not add to the remarks previously made in reference to them.

The present position therefore may be stated as follows. The leading article we have been considering (with its quotations) was submitted to the readers of *The Builder* as some sort of guide to enable them to arrive at a decision upon the subject before voting. The result of the plebiscite was a vote of eight to one in favour of registration. One peculiar feature being that notwithstanding the Council of the Institute's strenuous opposition to our measure, we find that the total number of negative votes received (although many were from non-Institute men) represent only about one-eighth of the Institute's membership. Under such circumstances one is apt to wonder whether the policy recommended for adoption by the Registration Committee of the Institute is one with which the general body of its own members is in sympathy.

In a letter to *The Builder*, our Secretary, Mr. Butler, pointed out that a plebiscite had been taken both by the Society of Architects and *The Builder*, yielding very similar results, and suggested that the Council of the R.I.B.A. should now organise one, not only of its own members, but of the profession generally, and subsequently act in accordance with the results obtained. By following this course I venture to say the Institute would practically and satisfactorily justify its claim to speak for the whole profession—a claim all of us would be glad to see amply justified; any assistance we could render would be willingly placed at its service, as we are not only willing but anxious that this subject, which is of such vast importance to all practising architects, should be dealt with in a fair, just, and comprehensive manner by the senior body, for after all is said we only wish it to carry its own policy to a

Digitized by Google

logical conclusion. Logic hitherto has not been a dominating factor in the framing of its policy; pure reasoning has had to contend at a great disadvantage with such incidentals as usage, sentiment, tradition, and, strongest of all, inertia. I submit that the advocates of the Registration Bill have the best and strongest arguments behind them, always stated fairly, honestly, and consistently, and should the R.I.B.A. take advantage of its present great opportunities and endeavour to meet in an adequate manner the general wishes, it will receive the practical support of an united profession, and incidentally add very materially to its own prestige and position.

COMPETITIONS.

Workington.—The Secretary of the Royal Institute of British Architects desires us to mention, for the information of architects proposing to take part in this competition, that the R.I.B.A. competitions committee is in communication with the promoters with a view to the amendment of the conditions of the competition for the Workington technical school.

ILLUSTRATIONS.

LIVING ARCHITECTS.—NO. 20, MR. ERNEST NEWTON.

MR. ERNEST NEWTON has been one of our most prominent and successful domestic architects for many years now, and has worthily upheld the honour of being Mr. NORMAN SHAW'S first pupil.

NO. 21, MR. WALTER CAVE, F.R.I.B.A.

MR. WALTER CAVE has filled for two years the position of President of the Architectural Association, which is in itself a testimony to his popularity amongst the younger members of the profession.

DESIGN FOR A TOWN HALL AND MUNICIPAL BUILDING.

THIS building was designed for a provincial town, the site being a large public square with the main avenue on the south side. The entrance to the municipal offices has been planned off this avenue. The town hall has been placed at the back off site. The seating capacity is 800. Public galleries have been arranged, also large orchestra and organ. A feature has been made of a promenade gallery around three sides of hall for use during dancing. The original drawing, by Mr. BERTRAM LISLE, from which our illustration is taken, was exhibited this year at the Royal Academy.

HIGH SCHOOL FOR GIRLS, STOCKPORT.

THIS school is now in course of erection in Beech Avenue, Cale Green, Stockport. It provides accommodation for 200 girls and fifty pupils in the Kindergarten department, there being eleven class-rooms and three division rooms. On the ground floor in a central position there is a large assembly hall, which is panelled in oak to a height of 7 feet 6 inches. The reception hall, library and committee room, and head mistress's room are also finished in oak. In the east wing are provided a gymnasium, dining room, and cookery class-room. On the first floor music rooms and practice rooms are provided, well cut off from the ordinary class-rooms. A large art room and science laboratory are also arranged on the upper floor. The building is faced externally with Accrington bricks, with Darley Dale stone dressing, and the roofs are covered with Elterwater slates. The construction is fire-resisting throughout. The contractor is Mr. JOSIAH BRIGGS, of Stockport, and Mr. S. MELLOR is acting as clerk of the works. The architects are Messrs. SPALDING & SPALDING & ERNEST G. THEAKSTON, of 36 and 37 King Street, Cheapside, London, whose design was selected in the recent competition.

HOUSE AT KINGSTON HILL.—MAIN STAIRCASE.

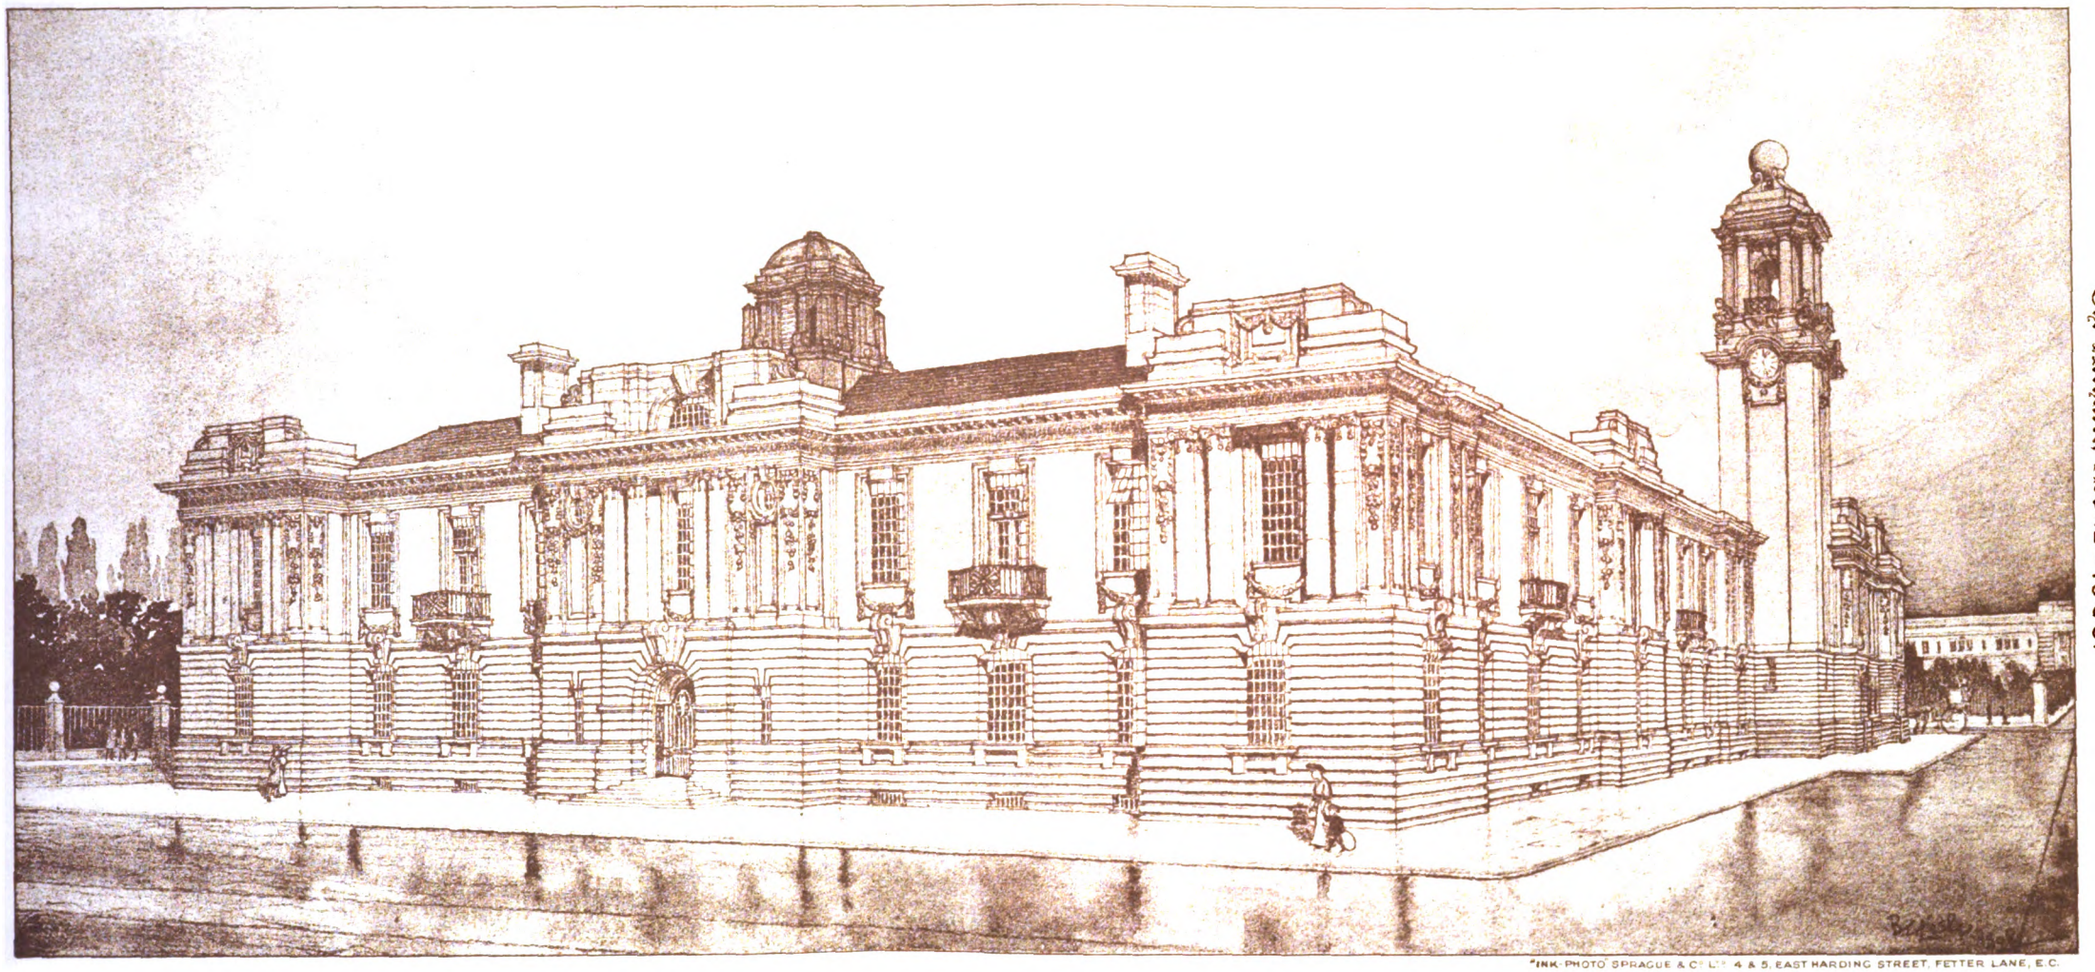
THIS house is situated at Kingston Hill, on a beautiful site overlooking the Banstead Downs. It has been the idea of the architect to adopt the Georgian tradition. No attempt has been made to introduce features merely for the sake of picturesqueness, but reliance has been placed entirely upon simplicity and proportion to gain an interesting and dignified effect. A feature of the front, which is perfectly symmetrical, is the Classical arrangement of cornice and frieze, the latter being formed by the broad-framed first floor sash windows with their louvred green shutters. Externally the walls are faced with bricks of a soft red colour, and the roof slopes are covered with sand-faced, uneven weathering tiles. The main cornice is of wooden construction with carved medallion brackets. In plan the rooms are arranged for the most part symmetrically; the drawing and dining-rooms are divided by an oak portable partition, which permits of a sufficiently large room for dancing being easily formed when desired. The garden is approached from these rooms through a verandah, with steps leading on the terrace. The oak staircase and panelling in the hall are based in design upon examples of the later Renaissance period. Other decorative features are the rain water heads, designed specially by the architect. The decorative carving is by Mr. T. OSMUND, Old Street, E.C., and the metal fittings by Messrs. GEO. WRAGGE, and the Guild of Handicraft, Chipping Campden. Messrs. D. S. THOMSON, of Wimbledon, for the gardens. General contractors, Messrs. W. H. GAZE & SONS, of Kingston-on-Thames. Mr. A. JESSOP HARDWICK, F.R.I.B.A., was the architect.

COMPETITION DESIGN FOR ADDITIONS TO TOWN HALL, STOKE-UPON-TRENT.

IN Mr. GEORGE BLOORE'S competition design, the present entrance to Glebe Street is intended as the principal approach to the small assembly hall and judicial end of the court, to the existing assembly hall, and the banqueting and to both floors of the large hall. To this end the existing staircase is to be completely remodelled, and the new one will occupy a position slightly north of it, thus enabling the present wide corridor to be continued. All the exits are on to Corporation land and not on to the towing-path. The acoustic properties of the large hall have been carefully considered, and the sides of orchestra are shaped in the funnel-shaped form, wider at the end nearest the audience, thus delivering the sound direct into the large hall where the numerous openings surrounding the first floor break up the sound and prevent any possibility of echo. It has also been thought advisable to leave the trusses open to view for this purpose. They can be suitably decorated. Two portions of the front to Tower Street it is proposed to face with Hollington stone entire, while for the front of the circular hall and the circular portion of small assembly hall best red-brick and stone dressings might be employed. The front of the court to Aqueduct Street to be faced with red-brick and stone dressings. It is thought that red-brick would introduce a little bright colour contrast, and it retains its colour longer than stone in a smoky atmosphere. The remaining frontages for the most part would be faced with a good, sound red brick. The areas where narrow to be faced with white glazed bricks. The cubical contents of the whole buildings are 795,070 cubic feet, measured from the top of the concrete foundations to half way up the roof, and it is proposed to divide this amount into what may be termed high and low-price work as follows:—

The large hall and front entrances, assembly hall, two front spare-rooms, ante and all committee-rooms, new rooms for banquets, staircase, judge and court-rooms amounting to 562,750 cubic feet at 8*d.*, works out to 18,752*l.* The remaining buildings amount to 232,310 cubic feet which, at 6*d.*, works out to 5,802*l.* These total to 24,554*l.* Adding 1,000*l.* for organ as instructed, the total cost equals 25,554*l.*

In view of the large amount of empty spaces in the buildings, it is reasonable to expect that the most of the work would not exceed the amounts stated.



An Exhibition of Mr. Arthur Rackham's water-colour drawings, illustrating "Undine" and "Grimm's Fairy Tales," will be opened on November 20, at the Leicester Galleries, Leicester Square. There will be exhibited at the same time a choice collection of water-colours by Birket Foster, and a series of drawings of English rural life by Mrs. Allingham, R.W.S.

HOUSE AT HORNCHURCH.

THIS house has been recently built in Woodland Avenue, Great Nelmes Estate, Hornchurch, Essex. It stands on a plot 88 feet by 300 feet. The external walls are rendered and floated in cement and sand, stippled and distempered buff. The woodwork is painted white, and the windows are casements divided with wooden glazing-bars. The columns on front elevation are cast-iron cased with expanded metal and finished in Keene's cement and painted. The roofs are covered with purple brown genuine Broseley tiles, and the chimney-caps and the yard wall are coped with the same tiles. The fittings throughout are good and the work has been well carried out by Messrs. EWINGS & WARE, builders, Stoke Newington, N. Mr. WALTER GRAY ROSS, A.R.I.B.A., of 1 West Street, Finsbury Circus, E.C., is the architect.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at Tufton Street, Westminster, Mr. H. Tanner, F.R.I.B.A., president, in the chair.

The Hon. Secretary announced that the annual conversazione would be held on November 24, at 8 P.M.

The following gentlemen were elected members:—Messrs. C. Grellier, E. K. Rowe, H. M. Whitehead, A. B. L. Roberts, R. Williams, R. S. Cobb, N. A. Walton, J. Basevi, W. S. Peto, and the Hon. L. J. Fiennes.

On the motion of the President hearty votes of thanks were passed to Mr. James Williams for a donation of water-colour drawings by the late George Devey, and to Mr. Ernest George for six water-colour drawings.

Mr. W. D. SCOTT-MONCRIEFF read the following paper on

House Drainage and Sewage Disposal.

When I was asked to contribute a paper and read it before the members of the Architectural Association I accepted the invitation with the greatest pleasure, but when it came to writing I found the task was not so easy as at first appeared. The first difficulty that occurred to me had reference to the section of the Association that ought to be particularly addressed. As a teaching body, which is now its most important function, the students should have the first consideration, but they, after all, form only a small proportion of the total membership, so that the full-fledged architect could not be overlooked, and besides, there is a great distinction between the kind of address that is suited to the respective capacities of the first, the second, and the third year student. All things considered, I came to the conclusion that a somewhat discursive paper might best meet the case, and that for several reasons. To begin with, it is hardly advisable that such an opportunity should in any way take the place either of the text-book or the teacher. The subject of drainage and sewage disposal is so full of necessary detail that a single lecture is an altogether inadequate medium of instruction, and in domestic sanitation more especially there is nothing that can supply the place of actual practice and experience. The most carefully acquired knowledge from a printed book must always leave many points uncovered and difficulties unsolved when principles have to be put into practice, and it is for this reason that I would venture to suggest the necessity for students to be saturated with an understanding of the principles involved, so that when troublesome points arise, even if they are not settled in the best possible way, they will, at any rate, be disposed of without any disregard of the general conditions that are universally accepted as the essentials of success.

All this is obvious, and may be accepted as little better than a truism, but unfortunately we have to deal with cases in which principles that have long been accepted as funda-

Digitized by Google

mental, and the very basis upon which architects have conceived and executed their plans, have been again made the subject of discussion and returned to the melting-pot of the unaccepted. It is here that I must address myself to the senior members of the Association, but in doing so I trust the youngest student may find something to think about, so that when his turn comes to take sides in the controversy he may bring his full share of well-matured argument to assist in the best possible solution of the problems involved.

I think everyone present will admit that the system of disconnecting the house-drain from the sewer has been so generally accepted, and has been so long in almost universal use, that it may be looked upon as a fundamental principle of good domestic sanitation.

Within the last few years this position has not only been attacked, but has been made the subject of argument from quarters that are too influential to be lightly disregarded. At the present moment the question is under the consideration of a departmental committee of the Local Government Board, and I am not aware of the architectural profession having taken any strong position as to their claim, their just claim, to take a leading part in the controversy. I think that architects are more interested on behalf of their clients, who are, above all others, the householders and ratepayers of the community, than any other profession, and I am afraid they hardly realise the extreme importance of the issues that have been raised.

Many years ago, but within the recollection of many of us, the only protection that existed against the dangerous intrusion of sewer-gas to the interior of our dwellings consisted of an unventilated soil-pipe provided with a D trap, connected to a pan-closet. The idea of making at some point a complete disconnection between the house-drain and the public sewer occurred to me, and no doubt many others, as an obvious precaution, but the honour of having put the proposal into actual practice and giving publicity to the system rests, I believe, with the late Dr. Fergus, of Glasgow, who made a manhole in his back garden on the line of his house-drain, where he fixed an old-fashioned form of trap with a disconnecting channel. This arrangement I saw myself more than thirty years ago, and I was keenly alive to its obvious advantages. Soon afterwards the arrangement first used by Dr. Fergus was improved upon by Mr. Buchan, who introduced an improved form of trap, which bore his name, and became widely adopted in connexion with an access chamber. This system of disconnection has remained, with a few changes in details, the standard arrangement ever since, and its adoption has spread all over the civilised world unchallenged until quite recently, when advocates have risen who almost demand that it should no longer be used and that the disconnecting house-trap should be definitely abandoned.

The first sign of revolt against this widely-accepted device of a disconnecting trap, so far as my information goes, came from the surveyor of one of the outlying London District Councils, who undertook the somewhat laborious task of making a systematic note of the actual working of several hundred disconnecting-traps in his own district and tabulating the results. It appears from this examination that the habits of the householders in that neighbourhood were, to say the least, somewhat peculiar, and seem to have been principally characterised by their indifference to the disappearance of their scrubbing-brushes, which the inspectors discovered in their disconnecting-traps. I think the obvious objection to making this information a ground for doing away with disconnecting-traps altogether is that it would not apply to other districts where the inhabitants are less indifferent to the disappearance of their domestic appliances and where a similar investigation would give totally different results.

The other argument used was of a very different kind, and consisted of a suggestion or claim or demand that the local authorities should be free to make use of the ventilated soil pipes of the householders as a means for solving the problem of sewer ventilation which surveyors have been unable to achieve in any other way.

To this proposal I think there are many serious objections, and the interests, as well as the principles, that are at stake are of such importance that I hope my referring to them very shortly will not be considered out of place. The argument that a certain amount of carelessness is unavoidable in the cheaper kind of houses occupied by people who are altogether indifferent to what goes on with their drainage, as I have said, disappears with the facts supporting it, and can carry no weight where the carelessness referred to does not exist. The other argument that the traps interfere with the use of soil pipes for the ventilation of the public sewers so as to avoid the use of street gratings is in a quite different category. It is true that sewer gratings on the level of the streets is not a sanitary arrangement, but, because sewer ventilation still offers many difficulties, it would surely be a mistake to interfere with the perfection that has been attained in our domestic sanitation by mixing it up with defects in the public sewers with regard to which great efforts are now being made to find a remedy. In certain states of the atmosphere, and especially when the weather is calm, it would be a most risky system that provided for foul sewers being ventilated through the house drains and soil pipes, where the gases would be absorbed by the water in the traps and discharged as foul odours in the interior of the houses themselves. Against this most serious occurrence there could not be a remedy of any kind, because the disconnection of which the trap is a necessary adjunct would be prohibited by the by-laws which it is proposed to alter in order to give effect to the new proposals.

Referring to the sewers, Sir Robert Rawlinson, who was a past-master in their construction, laid down the apparently reasonable proposition that if they were laid with an adequate fall and were efficiently flushed they would be self-cleansing, and that being so, their ventilation would be a simple operation if there were no foul gases to be dealt with. This seemed to be a simple solution of the problem by the expedient of avoiding the existence of the difficulty.

I do not know if there are any sewers that comply with the conditions he suggested and in which no nuisance has ever occurred, but it has transpired in ordinary practice that even sewers with ample falls and efficient flushing still give rise to emanations from the street gratings. It should be observed that in practice the flow varies greatly at different hours of the day and night, and that this must involve the existence of large surfaces that are so fouled as to give rise to the odours complained of. It has also been found that the movement of the air in sewers is of the most erratic kind, due to wind and other causes, and that arrangements that work admirably under certain conditions altogether fail owing to sudden changes which it is impossible to control.

It is difficult to arrive at reliable information as to the immediate effect of the existing arrangements upon the public health, because other conditions overlap so as to make it difficult to fix upon the one which is really accountable for the different death rates. There is certainly no immunity on account of a rapid fall in a particular line of sewers, because the gases may find their way most freely to the highest level, and the escape from the street gratings may be as bad, or even worse, at the top that at the bottom of the incline.

As matters stand at present it really amounts to this, that a sewer open from end to end, or, in other words, a well-constructed ditch, is just as much or as little likely to be a danger to health as a sewer with its foul gases escaping in a more concentrated form at any particular point. In this connection it may be well to refer to the experience of Bristol, where no system of ventilation has yet been found which could be adopted in any one district of the city without being detrimental to others, and, this being so, they have not provided sewer ventilation of any kind. All the same, the houses have been provided with disconnecting-traps, and there is no evidence to be found in the death rates arising from diseases in any way attributable to sewer gas, that can be regarded as unfavourable to the existing arrangements when compared with the death rate of other towns where the sewers are ventilated throughout. In any case it seems a poor remedy for any evils that may exist to ventilate the gases from the sewers on or about the level of the windows where the great majority of the occupants are in the habit of sleeping. My apology for having said so much upon this aspect of domestic sanitation must be that it is a matter seriously affecting the interests of architect's clients, and that the revolutionary proposals I have referred to ought to have their very serious consideration.

I do not know that with the short time at my disposal I ought to take up more of your time in dealing with the subject of domestic drainage, as there is little in dispute beyond what I have already dealt with, and until these new suggestions were made I think we were justified in considering that we in this country had not only been the pioneers of sanitation, but had reached to something very near perfection in its application.

Before going on to deal with the subject of sewage disposal there is one point on which I should make some remarks, as it must often prove to be a stumbling-block in the experience not only of the young architect, but of every member of the profession who has to deal with domestic sanitation. I refer to the question that often arises as to the amount of defect in an existing drain which justifies a recommendation for its complete renewal. As you all know, the method that has been adopted for many years and which has superseded all other

Digitized by Google

devices is the water test. In the case of stoneware pipes this is a severe test, and it is doubtful if it can always be regarded as a fair one. With so many joints made in a way that is never dreamt of as a practical means of bearing water pressure in other cases, such as the conveyance of a water supply, it seems strange that it should be justified in a conduit that is condemned if it is not water-tight when it happens to be used as a drain. Recent opinion as to the relation between bad

Climax of Aerobic Nitrifying Organisms.

smells and disease has not confirmed the extreme views that prevailed a few years ago, and in any case no one suggests that a slight leakage of sewage several feet below the level of the ground even inside a house can be of serious danger to the health of the inmates. If this were so, it is obvious that, *pro rata*, a well-manured garden would be almost certain death. Whether this view is a right one or not, if an architect does not condemn a drain for the smallest leakage that is perceptible under a water test, it is fairly certain that some other expert, if he is called in, will find it incumbent on him to do so, and in that event the architect who ventured upon taking a commonsense estimate of the danger will be looked upon by his quondam client as a man who did not understand his own business. As a matter of fact, this has often occurred in practice, and new drains one after another have been frequently condemned in the same house on a change of tenancy or ownership for some trifling failure in an arrangement which in practice is never subjected to a water pressure greater than that of the passing sewage, which is practically no pressure at all. It was from the consideration of these difficulties that I made up my mind long ago to look at the question, not from the relative merits of stoneware or cast-iron, *per se*, as the best material for the construction of house-drains as if the water test had not come into vogue, but from the point of view as to which was best able to stand the test when applied. This was more than twenty-five years ago. The first large building which was redrained throughout with cast-iron pipes in London was the Foundling Hospital, where I was allowed a free hand, but it was several years before the architectural profession began to see the necessity of considering the subject mainly from the point of view of the water test. It is obvious that, in the case of cast-iron pipes and connections, the whole system should be capable of standing a high pressure of water without the slightest leakage, and that if any occurs the architect is quite justified in condemning them.

In looking back upon the early days of domestic sanitation I remember the enthusiasm with which many architects took up the crusade against the prevailing defects: the old pan-closets, the foul D traps, the unventilated soil pipes, the dip-stones, and the bell-traps, all of which have now become ancient history with which the young architect seldom has to deal with nowadays. Among these was my old friend Mr. Philip Webb, but the architect who was most distinguished for his direct and original contributions to the solution of the many unsettled practical problems of that time was the Nestor of your profession, Mr. Norman Shaw. What he made use of in his own practice was an arrangement that not only provided for a double disconnection of the soil pipe from the house drain, but did away with the use of a trap underneath the closets and sinks as well. This he accomplished by means of a hopper head into which the soil and sink pipes discharged at their upper extremities, with a corresponding disconnection on the ground level arranged with a gully-trap. In this manner he avoided the use of any closet or sink traps inside the house, to which I believe he had a strong objection, and he at the same time advocated the adoption of soil pipes of a small diameter to avoid any accumulations upon their internal surfaces. It happens that a case came to my notice only last year in which these arrangements were condemned by a local authority as being inconsistent with their by-laws, and, in consequence, they were entirely removed and ventilated soil-pipes with traps ordered to be put in their place. I mention this because it was found that the system had worked exceedingly well for, I suppose, about twenty years; and it was discovered on the removal of the soil pipes, which were only 3 inches in diameter, that their internal surfaces were as clean as the day upon which they had been fixed. It is probable that if this system had been in universal use the proposal to do away with the disconnecting-trap between the house-drain and the sewer would never have been made.

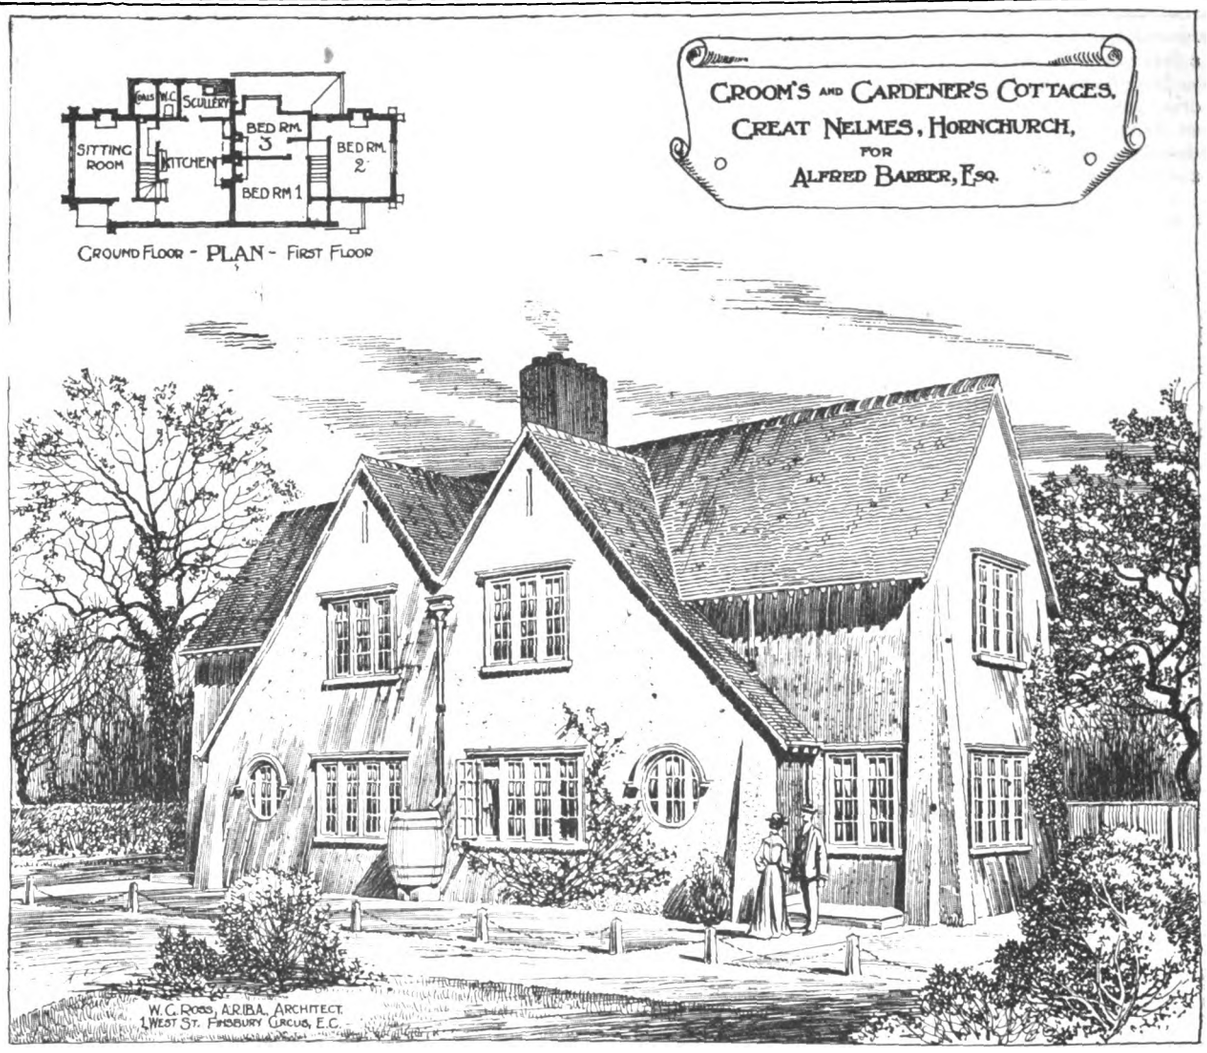
(To be concluded.)

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE first general meeting of the winter session was held on Thursday evening, November 4, at the Society's rooms, 10 Park Street, Leeds. Several new members and associates were admitted and the minutes of the previous meeting read and adopted.

The President, Mr. Percy Robinson, F.R.I.B.A., in the chair, announced the results of the Society's annual competitions, which, although lacking the keenness of previous years, had called forth work of a higher standard, the selection of sketches exhibited being particularly good.

The prizes were awarded as follows:—



Silver medal and President's prize for measured drawings, to Mr. P. de Jong; prize for design, to Mr. P. de Jong; prize for sketching, to Mr. J. H. Farrar; prize for construction, to Mr. J. H. Farrar; prize for essay, to Mr. F. Scatchard; Halden prize for testimonies of study, to Mr. F. L. Kruckenberg.

Sketching Club Competition.—Prize for best set of studies of ancient buildings, awarded to Mr. G. H. Foggitt; prize for best set of sketches, to Mr. P. de Jong; prize for second best set of sketches (consolation prize), to Mr. C. T. Whiteley.

The remainder of the evening was occupied in an examination and criticism of the students' drawings exhibited by the members present.

The annual smoking concert and distribution of prizes was held at the Queen's Hotel, Leeds, on Thursday evening, November 11.

COTTAGES AT HORNCHURCH.

THIS pair of cottages has been built in the grounds of the old mansion of Great Nelmes for the head-gardener and groom. The plans show the accommodation. The walls externally are rendered and floated in cement and sand, stippled and finished with distemper of a rich cream colour. The roofs are covered with old tiles from part of the mansion which has been demolished. The woodwork is painted apple-green and the ironwork dead black. The windows are wooden casements glazed with leaded lights. The cost was 475*l.* the pair. Mr. WALTER GRAY ROSS, A.R.I.B.A., of 1 West Street, Finsbury Circus, E.C., is the architect.

TESTS OF CAST IRON.*

(Concluded from last week.)

Casting Temperature.

THERE has been a good deal of discussion on the temperature at which cast iron should be poured into the mould, a medium casting temperature being considered by some to give the best results. To prove this, 10 cwts. of iron was taken from the cupola and poured into five sets of moulds. The first mould was poured at 3.40 P.M., well within two minutes of being tapped from the cupola, the second at 3.45 P.M., the third at 3.50 P.M., the fourth at 3.55 P.M., and the fifth at 4 P.M., showing a five minutes' interval between each mould. The tests shown in Table VI. clearly indicate that the mould poured first gave the best results.

Moment of Resistance Test.

It will be noticed that the transverse tests are all worked out to the moment of resistance in order to see what the result of a given test would be on the exact section of the transverse bar. In Table II. it will be seen that each bar is slightly over the 2 inch by 1 inch dimension, and the area therefore of each test-bar varies, as do also the tests, but when worked out to the moment of resistance based upon Unwin's formula :—

W = Breaking weight in tons,
L = Length of the bar between supports in inches,
b = Breadth of bar in inches,
d^2 = Depth of bar squared in inches,

$$M = \text{Bending moment} = \frac{WL}{4},$$

$$Z = \text{Modulus of section} = \frac{bd^2}{6},$$

$$f \times \frac{b.d^2}{6} = \text{Moment of resistance of bar to breaking},$$

$$f \times \frac{b.d^2}{6} = \frac{W.L}{4}.$$

Then

$$f = \frac{W.L.6}{4bd^2} = \frac{1.5WL}{bd^2}.$$

The tests show that whilst the transverse bars themselves may slightly vary, when worked out to this test based on the exact area, there is very little variation with the increasing silicon in one case, and a fall in the strength in the other. On the other hand, in the case of the bars tested as cast and as machined, whilst the machined bars may show if anything a less favourable result, if the breaking weight of the bar is based upon the exact area and worked out to the moment of resistance, it gives upwards of 10 per cent. better breaking load and 40 per cent. better deflection.

Transverse test-bars in Britain are of two sections, 2 inches by 1 inch and 1 inch by 1 inch, and the supports vary from 12 inches to 36 inches, and whilst it is not difficult to obtain an approximate comparison between these bars, it is very difficult to do so between our transverse bars and those of other countries. This difficulty could, however, easily be overcome by adopting such a test as moment of resistance, which is based upon the section of the test-bar and length of bar between supports, thus reducing the tests of all sizes of transverse test-bars to one common comparative result.

* Very hot. † Fairly hot. ‡ Thick § Very thick.

Conclusions.

1. The best tensile and transverse tests are obtained from bars which have been machined.

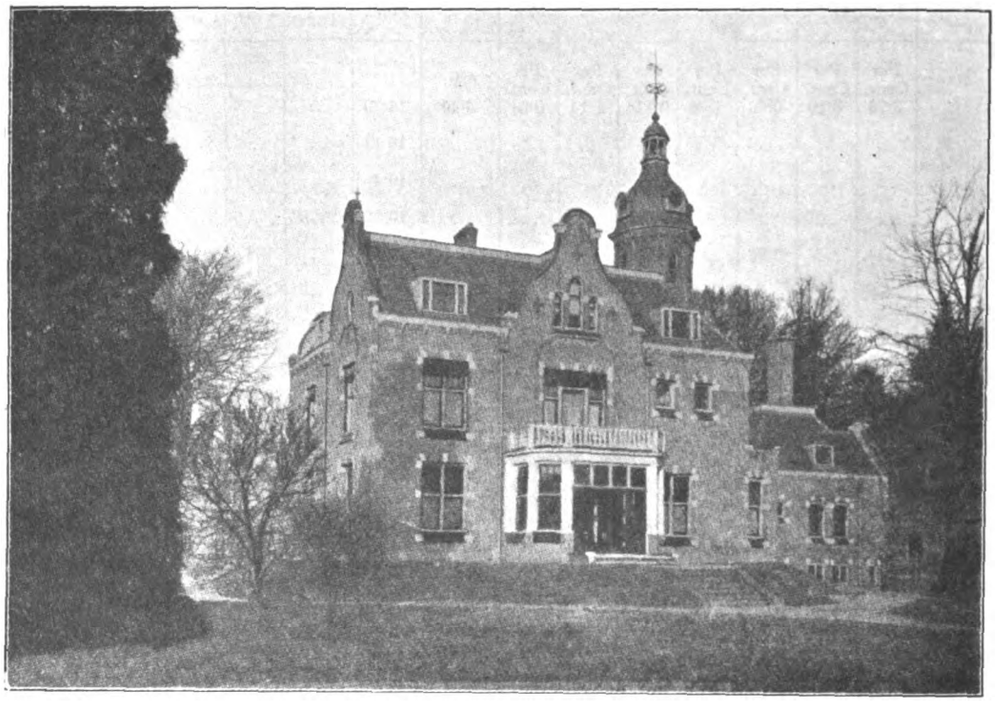
2. Transverse test-bars cast on edge and tested with the "fin" in compression give the best results in testing.

3. The transverse test is not so reliable or helpful as that of the moment of resistance.

4. The use of high-grade ferro-silicon in the foundry is of no commercial value.

5. Cast iron gives the best results when poured as hot as possible.

The author wishes to thank Messrs. William Gray & Co., of West Hartlepool, for placing their foundry at his disposal for these tests; and at the same time Mr. John B. Williams, their assistant manager, for the interest taken in the experiments; as well as his late colleague, Mr. George H. Hewson, for assistance in the analyses.



THE SURVEYORS' INSTITUTION.

THE ordinary general meeting of the Surveyors' Institution was held in London on Monday last, when the President (Mr. Alexander R. Stenning) made an interesting contribution to the discussions on the land problem in the course of his presidential address. The question of land, he said, was a subject of interest at all times. As a professional class, surveyors could not fail to have their interest in the subject increased by the legislative proposals now before the country. A wise policy of development meant prosperity to the profession, while, *ipso facto*, whatever checked that development had an equally adverse effect. To different classes land presented itself under different aspects. The farmer's chief concern was its constituent elements; to the builder it was simply so much surface to cover; while to our present rulers it was merely a taxable commodity whose chief virtue resided in its immobility. For the consideration of

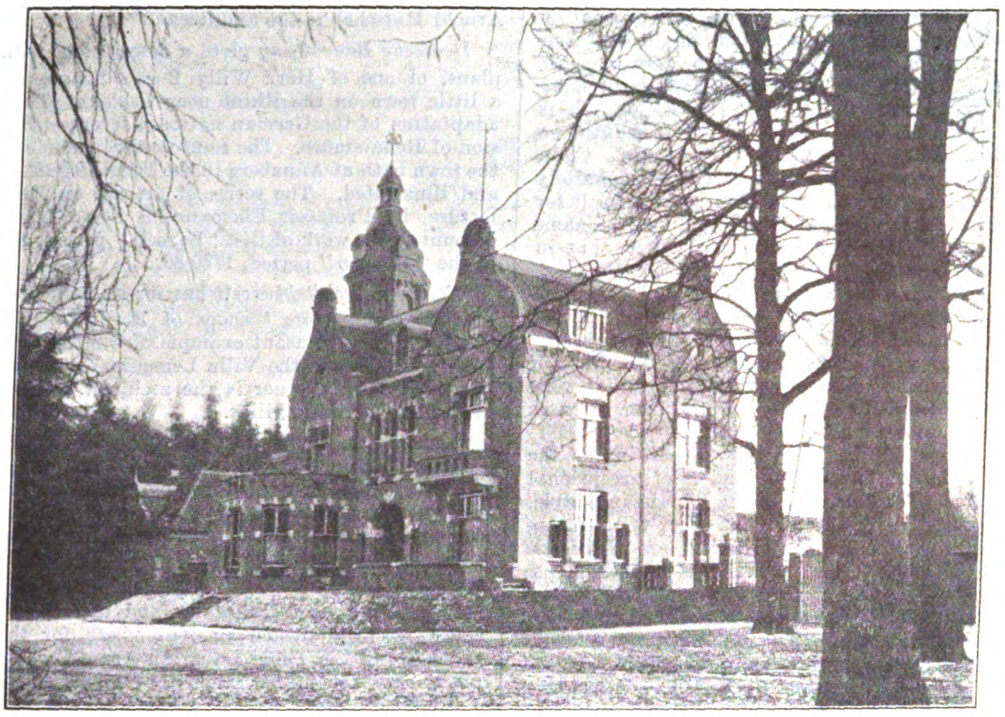
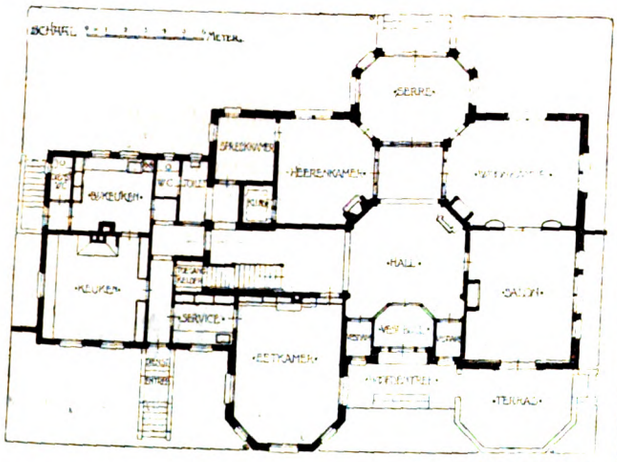
COUNTRY HOUSE AT VILSTEREN.—GARDEN FRONT [From *Het Huis.*

the Institute he would divide land into two classes—"food land" and "dwelling land," and in regard to the former, first discussed the question of ownership.



At the present time, he said, a great and growing school of would-be reformers are raising the contention that no man can have a right to hold any land as a private possession, but that, as in the old feudal days all land was deemed to belong to the Sovereign, so now all land belongs to the State, or to the sovereign people who have succeeded in gradually wresting from the Crown so large a proportion of the rights and powers it once enjoyed. Apart from any question as to the manner in which the State is to obtain possession of the land now in private hands, he for one did not believe that such State ownership would be for the good of the community. It may be admitted that a small minority of owners use their powers harshly, and that there are some incidents of private ownership which work injustice and hardship, both to individuals and to communities. But these can and ought to be alleviated by judicious legislation without subverting the social system. The experience of those countries where the primitive tribal or communal ownership of land has subsisted to the present day—Italy, Russia, India —does not encourage us to believe that any real advance in material welfare is possible under such systems at all comparable with that which we have achieved under the individualistic system with all its faults. Moreover, the present tenure of land in this country is the outcome of generations of social advance, and is buttressed by the growth of the traditions of centuries. By whatever mode possession was obtained in the distant past, and however wrongly the claims of the State were set aside by the original possessors, it cannot be denied that the present owners, in all but an infinitesimally small number of cases, paid in full for what they now enjoy. Confiscation by the State would be a crime and purchase a gigantic folly. The value of "food land," he continued, depended primarily upon what could be got out of it; and, secondly, upon what opportunities existed for marketing the produce. In a similar manner the value of the crops depended to a great extent upon what was put into the land. Here the speaker paid a tribute to English agriculture by remarking that, despite the fact that the wheat area of the country had been halved during the last thirty years, the returns showed that the farmer had adapted himself to the new conditions in such a manner as to obtain an increased yield in proportion to the area under cultivation. Further, the live stock on our farms had almost universally increased in numbers. These facts supported the suggestion that, in the absence of outside disturbing influences, the agricultural industry of Great Britain would regain its balance.

As for the value of land, no one could contend that the improvements in or upon it belonged to any but those who had made them or their successors. The present Chancellor of the Exchequer has recognised the injustice of assessing owners of land under schedule A for income-tax purposes, while commercial enterprises are assessed under schedule D. The small concession he made was due in part to actual returns from estates placed before him by the Surveyors' Institution, which showed that the annual cost of upkeep to preserve estates in a condition to maintain their present rents averaged 27½ per cent. of the gross rents. The capital expended upon food land, therefore, together with the annual cost of its maintenance, leaves little balance of value to be attributed to its original prairie or forest value. Dealing next with "dwelling land," the speaker remarked that this class, like "food land," derived its value from what could be got out of it. But in this case the crop took the form of rent, and was regulated according to the enterprise which the owner had put into his investment. The system of building leases, which plays so large a part in the development of building land in this country, has been hotly denounced by that school of reformers who seem to believe that the experience of the past is worth nothing, and that the only way to cure disease is to kill the patient. That at the end of a long period, it may be sixty or 100 years, the owner of the land should become by agreement the owner also of the building upon it, is described by them as rank robbery. But we shall all agree that unless and until the whole element of speculation is eradicated from all business, when few of us will care to indulge in it, the reversion of the building to the owner of the land is a rational and fair condition of leasehold tenure. The freeholder agrees to forego for a long period any chance of appreciation in the value of the site, and accepts a rent, well secured it is true, but small, and in no way commensurate with the value which the land will probably reach after a few years. If such additional value does accrue to the land, the profit is taken during the whole currency of the lease by the original lessee, or his successors in title, and till its termination the freeholder has no share in the profit. He is content to exchange his chances of immediate gain for the possible accrual to his children, or his estate, of a considerable future profit.



On the other hand, the leaseholder is enabled for a small fixed payment to exercise for a long period all rights of

ownership over this plot of ground. Instead of sinking a large sum in the mere purchase of the site, he has full use of his capital for as long a period as he is likely to want it himself. It will not be to the advantage of the community if the owner is to be deprived of this future bonus. If the leasehold system is to continue, he will naturally demand a rent in excess of what he is now willing to take, and the tenant's position will be worsened rather than improved. After quoting figures showing that in 1901 one-twelfth of the small working population of this country was employed in the building industry, Mr. Stenning remarked that because the owners of land were fortunate enough to find their property increasing in value year by year, the Government had decided that every building owner was to have taken from him one-fifth of any profit which might accrue on the land to be developed. No allowance was to be made for any loss he might incur. Now, surely, the man who took great risks was right in expecting the chance of substantial reward, and therefore, if so large a share of his profits were to be claimed by the State, he must, to protect himself, raise his terms. The ultimate effect of the tax would thus be to make houses more costly.

The immediate result of the Budget proposals has been to strike dismay into these men, accustomed though they are to considerable risks. Unable to foresee or calculate the whole of the risks they must run, they have chosen rather to be idle, with the unhappy result that the whole building trade is paralysed, and many thousands have been thrown out of work. The land-taxers say that the tax on undeveloped land will force into the market a good deal of land which is now held up to the detriment of the community; and they maintain that building land is limited in quantity and the scarcity is artificially aggravated by those who have a monopoly of it. Now in the first place I believe this assertion to be untrue, and in the second, even if it could be substantiated, I do not think the remedy proposed is the right one. It is absurd to say that building land is limited in quantity while in every county there are thousands of owners willing, nay, even anxious to sell. What is meant by the assertion is that certain owners on the outskirts of great centres of population are not willing to sell except at higher prices than are at present offered to them, and that some people are eager to obtain particular plots, which seem to them specially eligible, at less than the present market price.

HISTORIC HOUSES IN LINCOLN'S INN FIELDS.

THE improvements committee of the London County Council reported as follows to the Council, and at last Tuesday's meeting the recommendation of the committee was adopted:—

The Council on December 22, 1908, agreed to let to Mr. R. Stafford Charles, on behalf of a syndicate, the site of Nos. 61 and 62 Lincoln's Inn Fields for ninety-nine years at a rent of 1,500*l.* a year. In connection with this letting it agreed on May 25, 1909, to grant him an option until March 25, 1911, of taking a lease for ninety-nine years of the site of Nos. 59 and 60 Lincoln's Inn Fields, at a rent of 1,550*l.* a year, provided that, if the option were exercised before December 31, 1909, the rent would be 1,500*l.* a year. Plans of the building to be erected on the first site were approved during the recent summer recess. The agreement in respect of the lease of the site has not been completed although several appointments have been made with Mr. Charles's representatives for doing so, and the option in respect of Nos. 59 and 60 has therefore not been granted.

Our attention has been called to the fact that Nos. 59 and 60 are of considerable historical and architectural interest. We have had before us reports by the clerk of the Council

Digitized by Google

and by the architect on these points, and we have also consulted the local government, records and museums committee. In 1900 the general purposes committee, as a result of representations made by the Society for the Protection of Ancient Buildings, asked that, if consistent with the carrying out of the Holborn to Strand improvement, steps might be taken for the preservation of those houses which were of most historic interest. Of the houses affected none is of more interest than Nos. 59 and 60 Lincoln's Inn Fields. It is generally agreed that the house (which was divided into two a few years after 1750) was built by Inigo Jones. Colin Campbell, in his *Vitruvius Britannicus*, states definitely that it was designed by Inigo Jones in 1640. It was built for Robert Bertie, Earl of Lindsey, and thus obtained the name of "Lindsey House." The Council's records show that in 1700 the house was occupied by the Earl of Dorset, the poet, and thrice Regent during the absence of William III. from the country. Subsequently it was occupied by that Earl of Lindsey who was created Duke of Ancaster. It was in consequence known for a time as Ancaster House, though finally the title of Lindsey House prevailed. Another well-known person who occupied the house was the Hon. Spencer Perceval, Prime Minister from 1809 to 1812.

The house is one of the oldest now remaining on the western side of Lincoln's Inn Fields, and is of exceptional architectural merit. The façade is in the Renaissance style, of stone, since covered with stucco. The other two remaining houses in the square of great interest are Newcastle House, and Nos. 57 and 58. In the case of Newcastle House the freeholder, Sir William Farrer, has expressed his intention to preserve the existing front to Lincoln's Inn Fields, even when the rear of the site towards Kingsway is dealt with for rebuilding. In connection with the letting of Nos. 57 and 58, agreed to on January 26, 1909, it has been specially provided that the lessee shall preserve the existing front in character and design, and effect only such internal alterations as may be approved by the Council.

The local government committee are strongly of opinion, especially in view of the action which has been taken to preserve Newcastle House and Nos. 57 and 58, that Nos. 59 and 60 should not be destroyed until all other schemes for dealing with the premises have failed. They point out that it would be inconsistent with the Council's position as the statutory authority for the preservation of ancient monuments and objects of historical and architectural interest in London, to give its consent to a proposal which involves the destruction of one of the best specimens of domestic architecture with historical associations; and that were the Council to do so, it would be difficult for it in the future to approach private owners with a view to the preservation of similar buildings.

The Council of the Royal Institute of British Architects has expressed the earnest hope that it may be possible to avoid the destruction of these fine examples of historic architectural work.

We are advised that, if the present option be withdrawn, and the houses be let subject to a condition that the main internal features and the frontage be preserved, the Council will sustain comparatively little, if any, ultimate loss. Having regard to the facts set out above, we think that the frontage of the premises should be preserved, and with this object we recommend:—"That the resolution of May 25, 1909, with regard to granting to Mr. R. Stafford Charles an option of taking a lease, on certain conditions, of Nos. 59 and 60 Lincoln's Inn Fields, for ninety-nine years, be rescinded."

OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* gives an ecclesiastical number in the matter of illustrations, the examples being St. John's Church, Jacksonville, Florida, by Messrs. Snelling & Potter, a somewhat unhappy and fretful piece of Perpendicular; the Church of Our Lady of Guadalupe, Audobon Park, New York, by Mr. C. P. Huntington, a dignified Classic design; and Touro Synagogue, New Orleans, by Mr. Emil Weil, which may be presumed to be based on Byzantine or Romanesque.

La Construction Moderne illustrates and describes the new cattle market and abattoirs of the city of Lyons, for which M. Tony Garnier is the architect, and which will occupy an area of 244,000 square mètres and cost at least fourteen million francs. An infants' home, founded by the benevolence of the late Madame Louise Koppe, is also described and illustrated.

Architekten und Baumeister Zeitung has another example of Viennese city architecture in the shape of a building with shops on ground floor and mezzanine with flats above. The present example is in the Tuchlauben, and Arnold Hatschek is the architect.

Deutsche Bauzeitung gives a description, with views and plans, of one of Herr Willy Bock's houses at Vallendar, a little town on the Rhine near Coblenz. This is a clever adaptation of the German national seventeenth-century version of Renaissance. The reinforced concrete construction of the town bath at Annaberg in the Erzgebirge is also described and illustrated. The series of articles on Frankish architecture, by Professor Ehemann, is now concluded with an account of the work of the "Barock" period, 1650-1720, and of the "Rokoko" period, 1720-80.

Berliner Architekturwelt has for its principal subject one of the great "store" shops of Berlin, that of Hermann Tietz. A very pleasant example of a modern country house with accessories is the Villa Lemm at Gatow, on the Havel, of which Max Werner is the architect. There are several examples of smaller villas.

Dekorative Kunst has an appreciation of the work of Johann Vincenz Cissarz, one of the best known decorative artists of West-Central Germany. Another artist of whose work a full account is given is the sculptor Georg Roemer. An article on "Small Dwelling-houses" deals with the efforts of one architect, H. E. Von Berlepsch-Valendàs, to solve the question of building a small house artistically.

Der Profanbau illustrates and describes the new residence recently erected in Nuremberg for the general in command of the Third Bavarian Army Corps at a cost of a quarter-million marks, from the designs of Herr Gottfried Kurz, of Augsburg.

Construction extols the use of clinker bricks which a Toronto architect, Mr. W. F. Sparling, of the firm of Curry & Sparling, has employed in building his own house, both for exterior and interior facing. It is at least interesting as a study in texture. In an article on "The Modern Church: What should it be?" the question is answered by illustrations of several New York churches by various architects.

The *Engineering Record* has an article on "A Concrete Church and the Methods of Waterproofing it," the building being the Church of Our Lady of Mercy, now nearing completion in the Borough of Bronx, New York City.

Competition-Mongering.

SIR,—The attention that you devote to competition-mongering and its weaknesses deserves grateful recognition on the part of a long-enduring body of professional men.

I can write without animus, but with some knowledge, for in the past I competed for some of the important buildings, but so much water has run down to the sea since then that any personal bitterness is allayed.

I recall one instance of a select competition between myself and two others, where all three were shelved, and subsequently the architect, who held the balances, executed the work. But peace be to his *manes*—the relish supplied to me by the facts outweighs any disappointment.

The counsels' opinions reported in your current number are just what may be expected from members of the Bar, so penetrated by the cleverness of their minute research into phraseology as to disregard the obvious intent; it is such men as these that produce the judges, who decide by law in preference to equity.

I came to the conclusion a long while since that the best chances of winning in a competition (and the more important the latter, the more does this apply) was to depart to the utmost from the furnished conditions and stipulations.

I will not say that I have tested this method, as my arrival at the belief in its accuracy was probably coincident with my ceasing, Sir, to be

A DISAPPOINTED COMPETITOR.

FORTHCOMING EVENTS.

Saturday, November 20.

Royal Sanitary Institute: Provincial Sessional Meeting at Nottingham. Discussion on "The Improvement of City Slums by Housing Reform and Otherwise," to be opened by Alderman T. J. Dabell.

Monday, November 22.

Surveyors' Institution: Paper on "Town Planning," by Mr. W. R. Davidge, district surveyor.

Tuesday, November 23.

Institution of Civil Engineers: Continuation of discussion on three papers read at the meeting on the 9th inst.

Wednesday, November 24.

Architectural Association: Conversazione at 18 Tufton Street.

Manchester Society of Architects: Paper on "Ancient Lights," by Mr. P. M. Oliver, B.A.

Thursday, November 25.

Leeds and Yorkshire Architectural Society: Paper on "An Unknown Italian City," by Mr. Martin Shaw Briggs, A.R.I.B.A.

Concrete Institution: Paper on "Some Points Relating to Reinforced Concrete as Applied in the United States," by Mr. R. L. Humphrey, of Philadelphia, U.S.A.

THE GROWTH OF THE ENGLISH HOUSE.

HAVING in his great work on the Earlier Renaissance period of English domestic architecture given us a complete view, Mr. GOTCH has now presented us with a smaller handbook * which, though in a measure useful to the professional student, is rather better suited to the intelligent amateur of architecture, interested to know something of the houses of our ancestors, the part they play in reflecting the history and manners of their time, and the development by which they have reached the point at which the author stops, the end of the eighteenth century, by which time we come to many of the houses in which some of us live to-day.

Mr. GOTCH starts with the Norman castle as the first seed from which sprang and grew the English house, and says, "The keep, then, is the earliest form of English house built in permanent fashion." The so-called Jew's House at Lincoln at once occurs to us as a representative of probably very many stone houses of far less importance than the keeps or castles, but nevertheless built in what was at the time intended to be a "permanent fashion." The "permanent fashion" of a building designed to be merely the residence of a peaceful subject is quite a different thing from that of a castle, the fortress of a military chieftain.

It is quite wonderful when we consider the average life of an ordinary house, that is, not a castle or a palace, that we have left to us so many examples as there are of even thirteenth century domestic buildings, and it would be still more wonderful if we had more than the merest fragments of peaceful houses of the twelfth or eleventh centuries and *a fortiori* of earlier dates. Dilapidations, fire, and, above all, improvements, are constantly reducing the number of our eighteenth and nineteenth century houses. How can we expect to find homes rather than fortresses remaining as they were eight or nine hundred years ago? Because the fortresses remain whilst the homes have vanished, we cannot admit that Mr. GOTCH is justified in asserting that the keep is the earliest form of English house, even with the qualification of "permanent fashion."

We have ample literary evidence to prove that there existed in England, prior to the Norman invasion, two distinct types of house, the hovel and the hall, the homes of the serf and the master, the latter with a large contingent of dependents who lived in the hall, as Mr. GOTCH himself points out was the custom in the manor-house of the thirteenth century. Mr. GOTCH appears to be unable to get away from the obsession of a military ancestor for the English house, for he speaks of the thirteenth century manor-house as "fortified," a quite needless qualification. The origin of the hall in which the landowner and his farming men lived is not quite easy to determine. Certainly the Vikings brought with them the practice of living in "hall," but we are inclined to believe that it was of even older date.

Mr. GOTCH dismisses in a sentence the Roman dominion of Britain, and says, "We need not trouble ourselves about Roman villas; they were exotic, and there is no reason to believe that they had any influence on English houses." Considering the influence that Roman methods of building had upon English architecture, it is difficult to believe that the plans of houses erected in Roman times had not "any influence on English houses." Mr. GOTCH must have forgotten the "farmhouse" type of Romano-British house. This clearly shows a plan suitable to the "hall" method of living. So that, in our view, it is certain that the "hall" type of house existed in England before the Norman invasion, and highly probable that it was in vogue in the Romano-British period.

The keep essentially differs from the manor-house, as Mr. GOTCH points out, in that in the former the hall was accompanied by several rooms of equal size, whereas in the latter "it was not so much the heart of the house as the house itself." We therefore prefer to regard the Norman keep as an "exotic" and the manor-house as a descendant of a far older hall type of dwelling.

We think it must be his reliance upon the false premises of fortified keeps that has led Mr. GOTCH to ignore a very characteristic class of mediæval house, the grange, and to regard the moat as purely a defensive device. The plan of a grange so closely follows that of a manor-house in its adherence to the hall type that it would be difficult for anyone to suppose that both were not derived from a common ancestor; but even Mr. GOTCH does not venture to suggest that the grange was a derivative from the keep. With regard to the moat, we do not suppose Mr. GOTCH is prepared to maintain that this adjunct to so many houses in East Anglia, for example, was not intended rather as a store of food and water than as a means of defence against hostile intruders.

The town house of the Middle Ages is also strangely neglected in the author's historical survey. Is it because this cannot possibly be assigned the parentage of the keep, or because Mr. GOTCH will not admit the possibility of growth and development of this class of dwelling except for occasional illustration of façade design? A very interesting chapter might have been written on the growth of the cottage from the hovel, but cottages are not descended from keeps.

* *The Growth of the English House.* A Short History of its Architectural Development from 1100 to 1800. By J. Alfred Gotch, F.S.A., F.R.I.B.A. (London: B. T. Batsford. 7s. 6d. net.)

Digitized by Google

If one could but clear the book of the idea that the Englishman's house is literally a castle, it would be easy to follow Mr. GOTCH in his history and enjoy the lucid and yet not abstruse way in which he treats of the growth of the manor-house in mediæval times, its development in Elizabethan and Jacobean times, and its final supersession by the amateur and *dilettanti* of the eighteenth century.

Mr. GOTCH's history is, we think, not quite faultless, however, when he dogmatically asserts that the first appearance of the Renaissance manner in England was in the tomb of HENRY VII., "erected by the order of HENRY VIII. in the year 1516. Any work with Italian or Italianised detail may safely be dated subsequent to that year." The author refers to Layer Marney, and we believe that there is documentary evidence that the Renaissance work there was ten or twelve years earlier than HENRY VII.'s tomb.

We like the way in which the author treats first of the planning and general character of the house of each period, and then deals with the detail of features.

In a book intended for the amateur rather than for the professional, the author has done well to point out how much is due to the influence of local material in determining the character of the exterior of old houses, and how especially suited to the environment is the particular treatment adopted, a point too often forgotten in these days, when railway-carriage has abolished distance, and one can if one will commit the solecism of a red-brick house on a Westmoreland hillside.

We must regard Mr. GOTCH's latest book as an interesting introduction to the subject of English domestic architecture, and hence regret what we consider the false basis from which the growth of the English house is presumed to start, in view of the very admirable treatment of the subject when once the growth is fairly started and the seedling has passed through the sapling stage to the time of fruition.

NOTES AND COMMENTS.

THE report has been published of the Commissioners to the Board of Trade on the unfortunate explosion, which occurred last April, of the heating apparatus at the Thomas Barton Holmes Council School (Infants' Department), South Parade, Hull, resulting in the death of one child and the scalding of six others, as well as their teacher, the latter so severely that she was unable to attend the formal investigation held four months after the accident.

IT is satisfactory to know that the Commissioners are able to state that no one was to blame for the occurrence, that the apparatus was properly installed, regularly inspected and tested, and worked under safe conditions as far as could be reasonably expected. On the other hand, it is very disquieting to be told that such an accident, attended with fatal consequences, has occurred, and may therefore be presumed to be liable to occur in other cases, without any satisfactory reason being discoverable, and therefore in spite of the utmost care and precaution.

THE apparatus in question was of the small tube type, commonly known as the PERKINS High-pressure System; that is, pipes $\frac{7}{8}$-inch internal and $1\frac{1}{8}$-inch external diameters of wrought iron and butt welded were formed into a closed system, part coiled round the furnace, and the remainder serving as circulating pipes with an expansion-tube 6 feet 6 inches long and $3\frac{1}{2}$ inches external diameter, the length of the piping being 840 feet. The apparatus was tested by hydraulic pressure to one ton per square inch on October 30, 1908, and burst on April 5, 1909, at which date it was twenty-two years and four months old. As many of our readers know, it is the usual practice to test these high-pressure systems to about 2,000 lbs., or, as in the present instance, to one ton the square inch, and this had been done repeatedly during the life of the apparatus.

IN the course of the inquiry this apparatus was tested to see what pressure could be obtained from the boiler, and it was found that 1,800 lbs. could be obtained by special endeavour, sweeping flues, and skilful firing, conditions which did not exist when the explosion took place. The Commissioners therefore considered that at that time the boiler could not have been worked to its full pressure, and that the figure of 1,800 lbs. to the square inch was not nearly reached.

As to the possible causes of the explosion, the Commissioners considered the suggestions of water hammer and fatigue of the metal. The former they dismissed as improbable, the latter, they considered, might be slight, but not sufficient to account for the bursting of the pipe, in view of the fact that it had been tested in the previous October.

WE do not find in the report of the Commissioners any reference to a question that occurs to us to be of primary importance, the ultimate strength of the pipes of which the apparatus was constructed. In the tests made periodically one ton to the square inch did not burst the pipes. What pressure applied to a new pipe would burst it? Unless there is a large margin of excess beyond the ton to the square inch, we are inclined to think that the repeated application of the test pressure was a factor in the disaster. But in view of the fact elucidated, though unexpected, that it is possible to develope a pressure in these systems of 1,800 lbs. or more, it cannot be said that the test pressure of one ton is excessive.

THE report and the circumstances which it discloses form a most severe condemnation of the high-pressure, small tube system of hot-water heating. A system of which no amount of care in fitting, maintaining and working can ensure the freedom from fatal accident is not one that any architect can feel justified in recommending for adoption in any building with which he is concerned.

TECHNICAL institutes are not at the present time exercising that beneficial effect upon the youth of the country who ought to become the skilled workmen of the future, or to have become the skilled workmen of to-day, that the money lavished upon their foundation and equipment have led us to expect. Hence we have the various propositions of the new Lord Mayor of London and the London County Council. When the Lord Mayor advocates a return to the old-time system of apprenticeship, he implies that the technical institutes, which were supposed to supply the training that the decline of apprenticeship rendered non-existent, are ineffective.

THE London County Council looks at the question from a different standpoint. Its position, in plain language, is,—the technical institutes exist, but they have not got the scholars; therefore the school-leaving age must be raised, and "half-time" classes must be compulsory. Of course, the root of the trouble is that when a boy or girl leaves school at the present statutory age, they can do work of a kind and earn money. The work teaches them nothing, and the money is very small, but they can do the job sufficiently well, if not quite as well as a man or woman. Hence the man or woman displaced by the boy or girl is unemployed. In due course the boy or girl grows older and is in turn displaced by a fresh generation, and becomes both unemployed and unemployable.

IN modern building the architect finds one of his greatest trials in the increasing number of the untrained or half-trained workmen, and if either Sir JOHN KNILL's revival of apprenticeship or the London County Council's extension of the old Lancashire system of "half-timers" succeeds in increasing the number of craftsmen in building trades who ken and can, it will be to the advantage of architecture, whether we view it as an art or as a profession.

MR. G. T. BROWN, F.R.I.B.A., president of the Northern Architectural Association, in his address at the opening meeting of the season dealt, amongst other topics, with the growing evil practice of municipal corporations undertaking work in their own offices with their own staff which ought to be carried out by architects in independent practice. The ostensible reason of the practice is economy. It looks smart business to employ a young man just out of his articles at a salary of 350*l.* to do the architectural work of three or four schools a year when the outside architect's fees for any one of them would amount to the official's yearly salary. Equally so is it to spend 6*s.* 8*d.* on a book instead of going to a solicitor, or to buy a bottle of stuff at the chemist's for 1*s.* 1½*d.* rather than consult a qualified and experienced doctor. In each case money is saved, but value is not obtained. Even supposing the low-salaried official touches no "graft" and works a good deal harder than most officials do, it cannot be supposed that he is worth more than he gets, and in all professional matters it rarely happens that, however high his fees, the expert is not fully worth them. The money that is saved in fees is lost, over and over again, in unrecognisable directions when building is in question, and municipal authorities who work with cheap professional services damage the ratepayers' interests to an incalculable extent by not getting value for the money that is spent.

MR. TEMPLE MOORE, having made a further examination of Hexham Abbey, has said that the west wall of the north transept is in a dangerous state as well as the roof, and that the mischief is of old standing. That is the usual thing, of course: dilapidation starts, as it will do in every building; it is neglected, and therefore grows, and finally the point is reached at which immediate and costly reparation must be undertaken to prevent the whole thing falling down.

WE are glad to know that, after considerable delay and discussion, the Court of Common Council of the City of London has resolved to adopt the report of the Bridge House Estates Committee recommending that a new bridge over the Thames shall be constructed at an estimated cost of 1,646,983*l.*, and that Southwark Bridge shall be reconstructed and improved at a cost of 261,000*l.* We hope that in carrying out these recommendations the Corporation will take care to see that the new St. Paul's Bridge is worthy of the City of London, artistically as well as practically. On the Continent we see beautiful bridges at Paris, Berlin, Vienna, Ostend, and elsewhere. Let us have one in London.

THE famous Greek statue found on the property of the ALDOBRANDINI family at Porto d'Anzio more than twenty years ago has, by the beneficent operation of the Italian law against the exportation of works of art, become the property of the nation, the Italian Government having purchased the statue for 18,000*l.*

YOUNG MEN'S CHRISTIAN ASSOCIATION, PONTYPRIDD.

THIS building is now in course of erection. It has been planned to suit the particular requirements of the Association. The ground and first floor plans are illustrated. On the second and third floors, over the front portion, are the housekeeper's quarters, kitchens, boarders' sitting-room and class rooms, and boarders' bedrooms. At the back, a large concert hall and gymnasium runs up the height of the second and third floors, a special feature of the hall being the gallery, which is level and continued round the back of the stage, thus forming a running track. The building is fireproof throughout, and has a flat roof, to be used as a roof garden. The elevations are in red facing bricks of the neighbourhood and Forest of Dean stone. The general contractors are Messrs. KNOX & WELLS, of Cardiff. The design was prepared by Mr. VERNON HODGE.

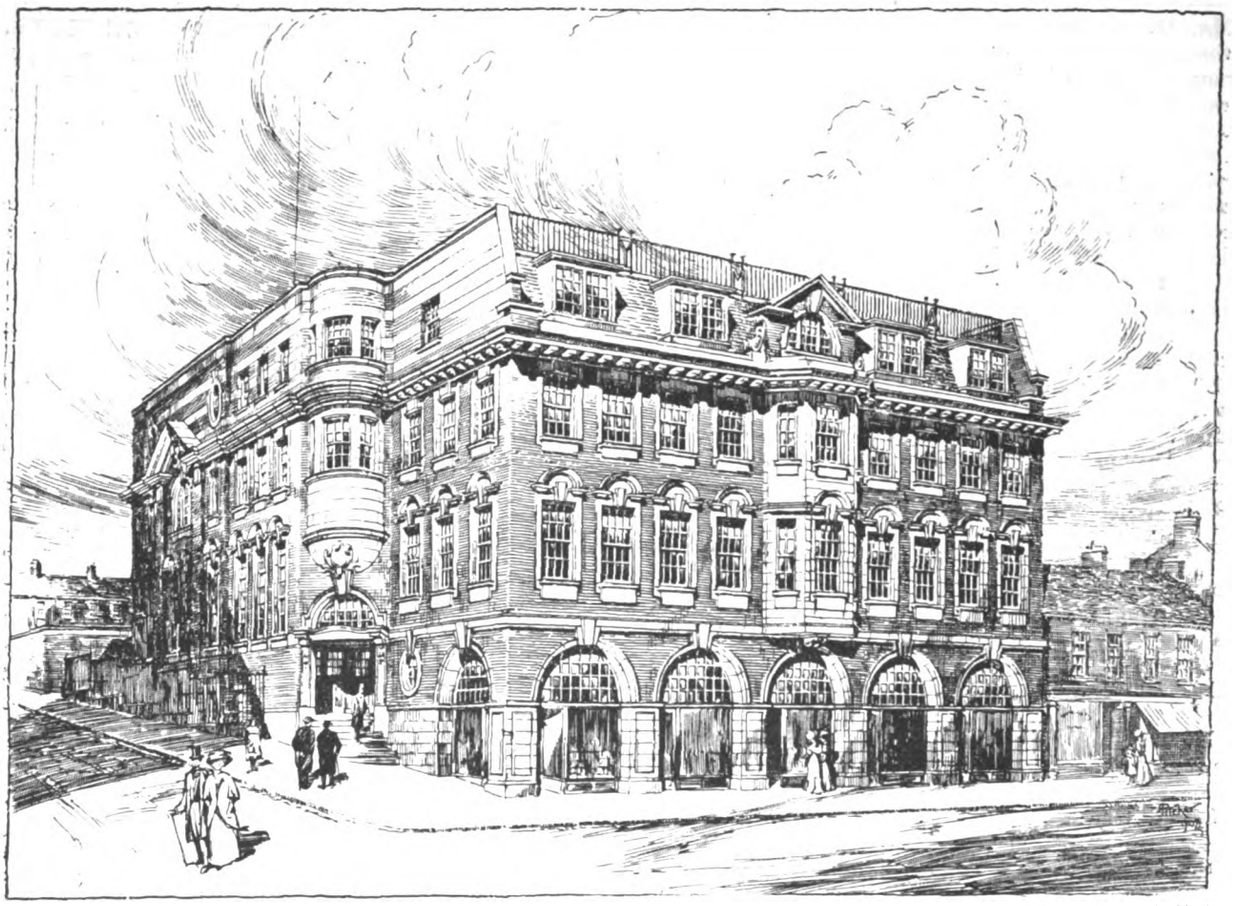
ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. Ernest George (President) in the chair.

Mr. H. T. HARE, Hon. Secretary, announced the decease of Thomas Worthington, past president of the Manchester Society of Architects. Mr. Worthington's connection with the Institute, he said, dated as far back as 1846, when he was awarded the Institute silver medal for an essay on the "History and Manufacture of Bricks." The deceased member was elected Fellow in 1863, and served as vice-president during the years 1885 to 1889. He retired from practice and was placed on the list of retired Fellows in 1907.

It was formally agreed that a letter of condolence should be sent to the relatives of the deceased.

Presentation of Mr. T. E. Collcutt's Portrait.

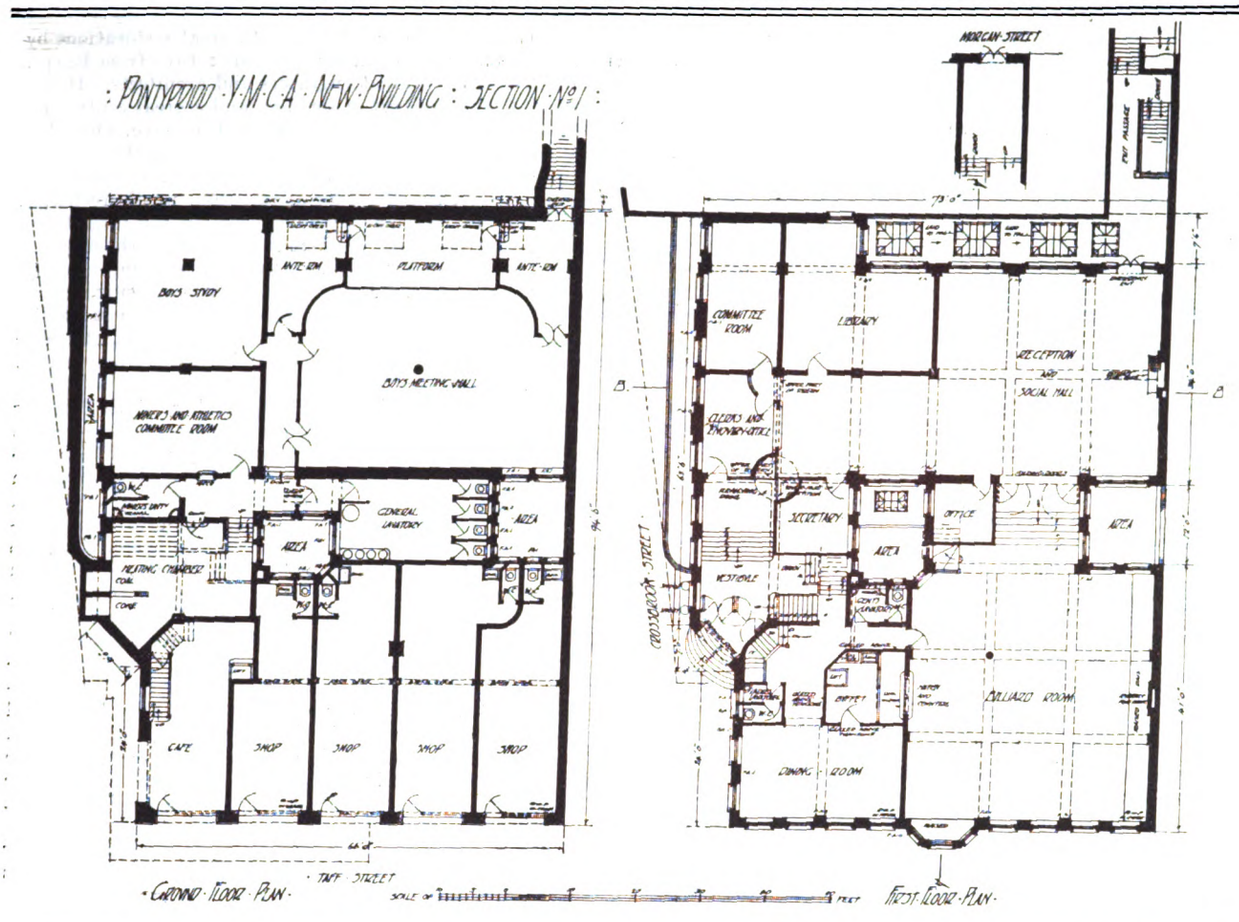


The PRESIDENT said the Institute had the pleasant function before it of receiving the last addition to its portrait gallery and a memorial of the presidency of Mr. Thomas Collcutt. The portrait was painted by Mr. Cope, A.R.A., to whom he said their thanks were due for so masterly and charming a work.

The Planning and Laying-out of Public Places.

Mr. H. INIGO TRIGGS, who had prepared a paper on this subject, was unable to be present at the meeting owing to indisposition, and the paper in his absence was read by the Secretary.

The author dealt more particularly with the architectural side of his subject, and considered the planning of public places from a modern point of view. Whilst admitting that many lessons could be learnt from classic and mediæval planning, he suggested that imitation of the same arrangement would not meet modern requirements. A demand, he said, had arisen for new types of public places, for traffic places that should effectively receive and distribute streams of vehicles with safety to pedestrians, for monumental and garden places that should show to the best advantage the buildings that surrounded them, and for places that should be useful at the same time for military parades, exhibitions, or sporting purposes, sanded or turfed, and surrounded by trees, such as the Champ de Mars. They had even to anticipate the possibilities of aviation. The author alluded to the importance of grouping the principal public buildings, and explained how in replanning Paris Baron Haussmann and his successors had fully realised that more depended upon the placing of structures than upon the structures themselves. Town-planners, too, in the United States had, within the last decade, grouped their public edifices, increasing the æsthetic effect and the simplicity of administration and maintenance. In London they had too often lost sight of the importance of enclosure to a public place, and in citing Hyde Park Corner as an example, Mr. Triggs said the scheme would have been finer had the five broad roads which entered the enclosure been arranged to converge towards a large semi-circular architectural place. The sense of enclosure, however, need not necessarily be obtained by means of architecture, and often a fine effect might be made at very small expense by the skilful planting of trees; but where planting was substituted for architecture it should be of as formal a character as possible. In order to further obtain the effect of enclosure, the streets opening into the place should be as far as possible so planned that a vista was avoided and that the eye travelled over the open space and rested on one of the boundary walls. Continuing, the author said the public places of a modern city may be considered from three wide aspects, traffic, business and ornament. In England the possibilities of treating traffic places as a means of properly intercepting and distributing traffic currents have not yet been fully realised, and it has generally been considered sufficient to place a few "islands" at those points where pedestrian traffic seemed to demand them. The second class, which we will term business places, include those various types of place whose principal object is to facilitate the transaction of business, such as the market-place and the garage place in front of railway stations or similar points. Ornamental places include all those laid out solely with the object of adding beauty to the surroundings without any regard to traffic. We do not, of course, mean to imply that a traffic place may not be also a beautiful spot. Architectural places include those which are designed to set off the surrounding architecture to its best advantage. It frequently happened that the fulfilment of two or more different purposes was attained by one public place, as in the Place de la Concorde, Paris, which was both a traffic and an ornamental place, and also in some of the Parisian *ronds-points*, which, besides receiving and distributing the traffic, were adorned with gardens, monuments, and



Digitized by Google

Y.M.C.A. PREMISES, PONTYPRIDD. [*Vernon Hodge, Architect.*

fountains. The Place de l'Etoile was a combination of a traffic and an architectural place. The ideal form of town plan was the one in which the smallest number of traffic places occurred, and it certainly did not add to the ease with which traffic circulated, if it was continually being obstructed by a large number of streams converging to one point. But as they could not do away with such places and must perforce regard them as a necessary evil, it only remained to guard against the formation of useless traffic areas, and in planning such places to take the greatest care, first to estimate the volume and direction of the traffic, and then to regulate it by the disposition of the islands, whether they be the mere oval-shaped refuge or the more ambitious garden or monumental plot. For practical reasons it was desirable that the various lines of traffic should not intersect one another at one point, and where this was likely to be the case that point should be chosen for a pavement or grass plot. High monuments, or any objects likely to impede the drivers' view were to be avoided in such a position. Mr. Triggs then considered how the various places devoted to business or pleasure, in which were included market-places, exchanges, and places for public shows and festivals could be arranged to serve double purposes. In the larger towns of England and on the Continent open markets had gradually given place to closed ones, but in smaller towns and in suburban areas where a demand still existed they could still be encouraged, for besides being a valuable municipal asset if properly planned they might confer great benefits upon all classes. Plenty of trees should be planted round the sides and in the centre, and every effort made to render the place attractive as a promenade, as well as a useful centre for shopping. It might also be possible to lay out such a place so that, in addition to being a market by day, it might be used for entertainment purposes in the evening, after the manner of some of the small Spanish *alamedas*. The long stretch of the Piazza Navona in Rome, adorned with three magnificent fountains, used as a market by day, was illuminated and rendered charmingly attractive as a public dancing place by night. The author next treated of places entirely surrounded by buildings, and he offered the opinion that such squares should rely for their effect entirely upon their own architecture. It might be regular or irregular, but the enclosed space should belong definitely to one type or the other. Though the square form was pleasing, the oblong arrangement was most generally used. The garden place in a town square called for treatment in a formal manner, and the introduction of turf or trees subordinated to the architectural character of the place. Mr. Triggs lamented the indifference that was apparent in making London squares attractive, and expressed surprise that so little was done towards making them bright by the planting of trees, shrubs, and flowers. The author then went on to deal with the value of forecourt places as means of exhibiting the architecture of important public buildings to their best advantage. It was inadvisable, he said, that such buildings should be erected in a line with the frontages of the other buildings in the street, and if it was possible to set them back somewhat an air of greater importance was imparted, and at the same time they gained considerably by being seen in a more favourable perspective. France and Rome afforded many charming examples of such treatment. The last part of the paper dealt with places which were partly built upon. These frequently, said Mr. Triggs, occurred in cities where triangular and irregular sites had been created by intersecting thoroughfares, and were suitable for the erection of such buildings as churches, museums, and picture galleries, whose character demanded an open site on account of their architectural importance and of the necessity of obtaining light on all sides. Extremes of narrowness and width were to be avoided; an exaggerated width led to a feeling of emptiness which it was not easy to disguise by tree-planting and gardens. It is, of course, difficult for the designer of the place to estimate the probable height of the building to be erected, and the future might generally be left to the sensible treatment of others, if the authorities on their part would only insist on the importance of recognising the necessity of proportion between the width of the place and the height of the adjoining buildings. That class of place demanded skilful treatment where it occurred in a position terminating a vista and forming the meeting-place of several traffic arteries. In that respect most of the best examples were to be found in Paris, where the importance of obtaining a series of imposing street vistas had been better realised than in any other city. In the smaller English towns they often found the market-hall placed in the middle of an open place, as at Abingdon and Peterborough, with a very pleasing effect. In larger examples the traffic requirements demanded that the buildings should be set well back from the traffic currents, and the many instances they found of the violation of the rule resulted in great disturbance to the traffic. The Place de l'Opéra and Place de la Madeleine, Paris, and

Digitized by Google

the Gensdarmen Markt, Berlin, were good examples of ornamental places, though varying considerably in their character.

Mr. H. V. LANCHESTER, in proposing a vote of thanks to the author of the paper, said they were indebted to Mr. Triggs for the breadth of his studies in connection with the treatment of public places. The paper referred to the axiom that more depended on the placing of the important buildings than on the structures themselves. That would be true, the speaker suggested, in the school of formal civic design, but the opposite was also true when they came to the informal method of civic design. The latter arose from the adaptation of the natural lines of traffic and the obvious utilities of the primitive city, and it seemed to him that those cities which had been apparently laid out by instinct had acquired a charm which was lacking in those planned and laid out in studied design. They saw in the one case a school that said let us have buildings absolutely adapted to their positions, however curious and irregular they may be; let us study the irregularities of the site and secure every charm available. The other school said let us study the position of our buildings, and if the positions are reasonably good they will tell of themselves. He was sorry not to have seen an illustration on the screen of Mr. Triggs's scheme for a semicircular place at Hyde Park Corner, as the author's intention was not quite clear to him. With regard to the garage place opposite railway stations, he thought in England they were more in favour of circulating the traffic. The method adopted was more or less slip-shod, and he believed a great deal might be done to make the circulation easier and more gradual. In alluding to forecourt places, Mr. Lanchester said the arrangement had no doubt grown up from the feeling in the south of Europe that there should be a gradation in the act of passing from the outside air to the interior of a building. The planning of a building and its surroundings was not a distinct thing, and a passage was adopted from the open air to the building by *loggi*. In northern climates they did not feel there was the same need for graduating the transition between the building to the open street. Architecturally they could not help feeling the value of forecourts to important buildings, for even from the earliest periods it formed part of the general plan, and in the narthex of the early churches they had a familiar example of its importance.

Mr. PAUL WATERHOUSE seconded the vote of thanks, and said he regretted that the author of the paper was not able to be with them. He did not wish to enter into a discussion of general subjects, but he would like to make a few remarks on what he might call general grounds. He felt that the whole question of planning places or *Places*, so far as it had practical bearing for architects, must be intimately wrapped up with the general principles of town planning. Those general principles might be divided into classes—the needs of small provincial cities and those of a large metropolis, and in another division the entire new planning of an old city. The real trouble of their unhappiness in regard to London was that they did not see how the remodelling of it was to come within the range of practical politics. The Traffic Commission had achieved an enormous work in bringing together data of the very foundation of the difficulties of the traffic problem, and the speaker believed that if the scheme suggested by the Commission was nurtured architecturally and brought into harmony with some of the existing buildings, great benefit to the metropolis would ensue. Another solution of the traffic problem, he believed, could be found in regulated gyration and the making of subways in crowded centres; the viaduct system too might be adopted, for there were places in London where time was lost by the congestion of vehicles, and a remedy would be attained by overhead traffic.

Mr. H. H. STATHAM said reference was made to towns formed or planned on natural lines, and he asked what were natural lines. Thoroughfares might have begun as lanes passing fields, but he did not see in considering town planning what they had to do with natural planning. The town was an artificial thing, and they had to treat it as such. There was a great deal to be said for radiating streets, but he reminded them that from the point of view of buildings such schemes left a great many awkward plots, awkward to plan, and awkward to treat architecturally.

Messrs. Francis Hooper, W. Woodward, F. W. Speaight, and Raymond Unwin also supported the vote of thanks.

THE BRITISH SCHOOL AT ROME.

THE annual meeting of the subscribers and friends of the school was held on Tuesday last, Sir W. B. Richmond, R.A., in the chair, when the ninth annual report of the managing committee and Dr. Duncan Mackenzie's report on Discoveries in Sardinia were presented and taken as read.

The committee's report states that the year 1908-9 has been marked by two features of special interest—the successful excavations in Malta carried out by the Government of Malta with the collaboration of the school, and the comple-

Digitized by Google

tion of the catalogue of the Capitoline Museum, which the committee have pleasure in announcing will be published in due course by the Clarendon Press.

Dr. Mackenzie's report deals with the discovery of dolmen tombs and the nuraghi, which in Sardinia "are of the very greatest importance, especially from the point of view of their strategic influence. They form a regular network as far as the sea, and one can see by studying their positions of vantage that they were all directly or indirectly in signalling communication with each other."

It may perhaps be supposed that from the stress laid on the excavations in Malta and the relics of the bronze age in Sardinia that the work of the British School at Rome is mainly concerned with prehistoric archæology. Such, however, is not the case, and the committee's report deals with the work of several of the students and associates who during the past year have given their attention to Roman work of the Classic Imperial time, to Mediæval and Renaissance colour decoration, to Renaissance architecture, as well as to subjects of more purely archæological character.

A collection of drawings showing the width of scope of the work of the school was exhibited.

Possibly the most interesting feature of the meeting was the suggested formation of a Society for the Promotion of Roman Studies on the lines of, and in collaboration with, the Society for the Promotion of Hellenic Studies, the Council of which latter Society has taken the initiative in the formation of the new body.

Sir W. B. Richmond said that his only claim to speak was that he was an enthusiastic amateur and that archæology had always had a great fascination for him. The fruits of a cultivated observation could, however, never be out of place in a gathering of scholars, for book-learning without it cramped the mind. As in an engrossing lecture the introduction of graphic examples is necessary, so archæology brings to history vitality and accuracy.

Archæology is essentially a modern science. Though scarcely a century old it has converted dead into living pages of history and illuminated much that was obscure. The study of archæology is perhaps the most practical way to learn history. A hundred years ago the knowledge of Egypt was practically nil, now through the labours of archæologists it lives again. Schliemann, despite opposition, broadened our views of the Greek races and directed attention to Crete, where Arthur Evans, Mackenzie and Hogarth have since attained revolutionary results. Boni and Lanciani, following on Rossi, have traced the annals of Italian races. These and others have, in a sense, remodelled history and shown the building up of ancient civilisations. Their labours have been most serviceable to artists, whose spontaneity and technical artifices need not be hampered by being inexorably truthful when the mind can be projected into the very atmosphere of ancient life. It is possible to give such local colour to ancient themes that they now possess as much raison d'être for art as any modern subject can provide. Yet curiously it is banal to do so, as if no fine work of art could be produced except the motive be the everyday and the commonplace.

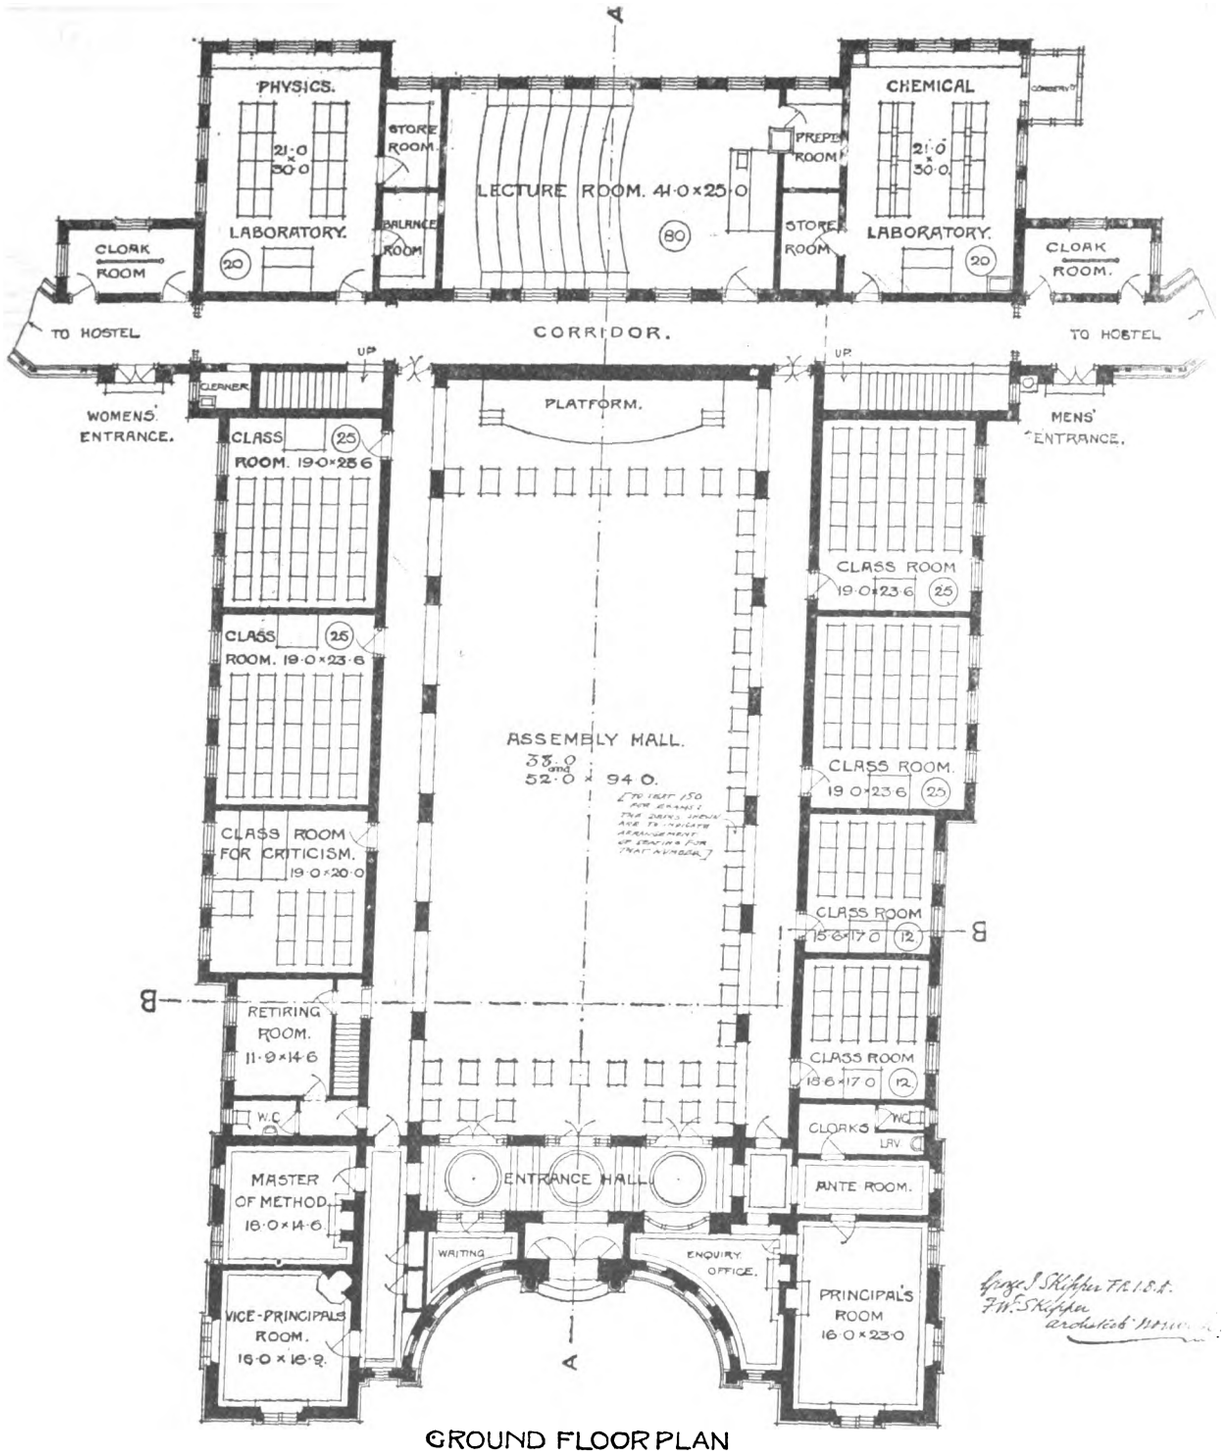
Although Italy has been thrown open to an extraordinary degree, all archæologists seem to have concentrated round the Capitol. To some extent this was inevitable. But a more or less fresh field for the operations of the British school might be found in many important centres where Italian life has been working its destinies from prehistoric periods to to-day. Italy is full of variety and possessed of abundant manifestations of individual though related art. The whole country is a mine of unexplored treasures; and to spend two or three weeks in some of the smaller and more out-of-the-way cities is only to have enough time to begin to know people who would aid in researches, and to touch only too lightly on the fringe of what might prove to be unknown treasuries. Everywhere a local archæologist is to be found, struggling sometimes to bring out a book, with small funds and a pittance to live upon, learned in his way, and ready to give up his time to an eager stranger.

There are one or two places which might be mentioned as offering reward to the well-equipped and strenuous student. All know of the treasures found at Palestrina, but how few really know the place whence they came. Summer would be the best time, when long days can be spent unravelling the countless links of a chain which bind ancient "Prenesti" to modern life. Prenesti gained its independence before Rome, and is in its way as interesting. This little city, on a spur of the Sabine Hills, is contained within the area of the Greek Temple of Fortune, whose Cyclopean walls cover a line of some three miles. It possesses historical evidence from prehistoric times, through Etruscan rule, the great Republican period and the Empire, the latter ending with great restorations by Hadrian, probably immediately after his return from Egypt.

Here foregathered great engineers and architects. It was the seat of a religious cult of fortune, and a great centre of a mysterious kind of cave worship. Around the cave, which has been at some time apparently cased with metal, there gradually arose a college of priests. The Temple grew up under Etruscan, Republic and Imperial sanction, until erected on several hewn-out terraces it became perhaps the largest and most important in all Italy. One can almost see the majestic pile, the various altitudes of terraces, the culmination of splendour which rose up at the extreme altitude, surrounding the sacred cave whose floor still displays the mosaic pavement, set there possibly by Greek and Egyptian artificers, elaborate in detail, finished as workmanship, and strangely romantic in its design.

The basilica erected over the sepulchre of the martyr Agapito is as a growth from the ancient shrine; it is encrusted with tablets; Christian and pagan signs jostle one another, giving evidence of the subtle interweaving of pagan and Christian votaries. Several fragments of Egyptian obelisks have been discovered; and in many parts of the mediæval town highly ancient pavements and walls crop up, some Cyclopean or Pelasgic, others of the Republican periods. In this small area there must be yet undiscovered history. A restoration of the temple was made by an Italian architect, and since its publication some excavations have been carried out, but there remains much to be done. Mention must be made of a group of colossal scale, carved out of the rock, unfinished, but noble in the extreme, probably by Michel Angelo when he stayed self-exiled with the Colonna family. This group has been strangely overlooked. It seems to be the work of that master in his prime, unfinished, though the greater parts of it are; the figure of the dead yet living Christ could scarcely be the work of any other hand than his.

Volterra is another town but little visited. In the summer it is one of the most delightful places in all Italy, and teems with possibilities for the student of nature, art and archæology. The distasteful invasion of philistinism has not yet reached even the outskirts of its ancient walls, or at least it had not done so eight years ago. The muniment rooms of the Palazzo Publico contain thousands of details, chronicles and literature on every conceivable subject connected with the city. There is no museum of the kind to be compared with the Etruscan Museum of Volterra, either for the quantity or the quality of the works mainly executed in alabaster, and often exhibiting a local genius for design neither Greek nor Roman in character, but obviously the apex as it were of an indigenous art, if there is such a thing. The subjects range from reliefs relating to death and the travelling soul, to episodes from the Iliad, especially of the story of Helen and Paris, some of which not being at all archaic, but highly accomplished art, are remarkable for spontaneity and freedom of design. Scattered about in various churches there are very fine pictures, besides some unfinished frescoes by Ghirlandajo, of first-rate importance as regards the fresco painter's technique.



The fact is we have only been permitted a glance at the treasures contained in Italy, treasures which may still await the student in most unexpected places. If in a summer wandering one only found a single important work, or even clue to one, that would be a reward for roughing it a little in a glorious climate and among a delightful people.

Another field for a student of the British school at Rome would be the investigation into the unsolved problems of wall paintings. In the Museo Nationale at Rome there are some fragments of such inscribed with Greek names, which are of great beauty of design, execution and colour. One longs to know the methods of those ancient masters, the pigments they used, what technique was employed.

The scholars of the school need be no "dry-as-dusts" in the face of all the fresh conquests there are before them to achieve, if with energy and enterprise they manfully attack hitherto unvanquished difficulties, and lead to others as extended knowledge is gained and experience accumulates. The prompting voice of enthusiasm will call out enterprise, and solid hard work undertaken gravely and in earnest, must in time make the young English school at Rome an important factor in the history of Italian archæology.

Sir Rennell Rodd, K.C.M.G., in seconding the adoption of the annual report, said he had only just returned from Rome, and he could report that the school was getting on very well. What was most wanted was students, and these would, he trusted, be attracted to the school by the knowledge of what they could obtain from it. To be absolutely candid, it was impossible to look at the sister institution of the United States without envy. There was lots of room for more students so

long as Italy presents such enormous fields that have been hardly investigated, and it was to be hoped they would go to Rome from England as they do to Athens. In archives alone the resources of Italy were practically limitless. It was true that there were not the same facilities for exploration as in Greece, but that for many reasons was impossible. The school was very vigorous and flourishing. The work of the director and the assistant-director would alone justify its existence.

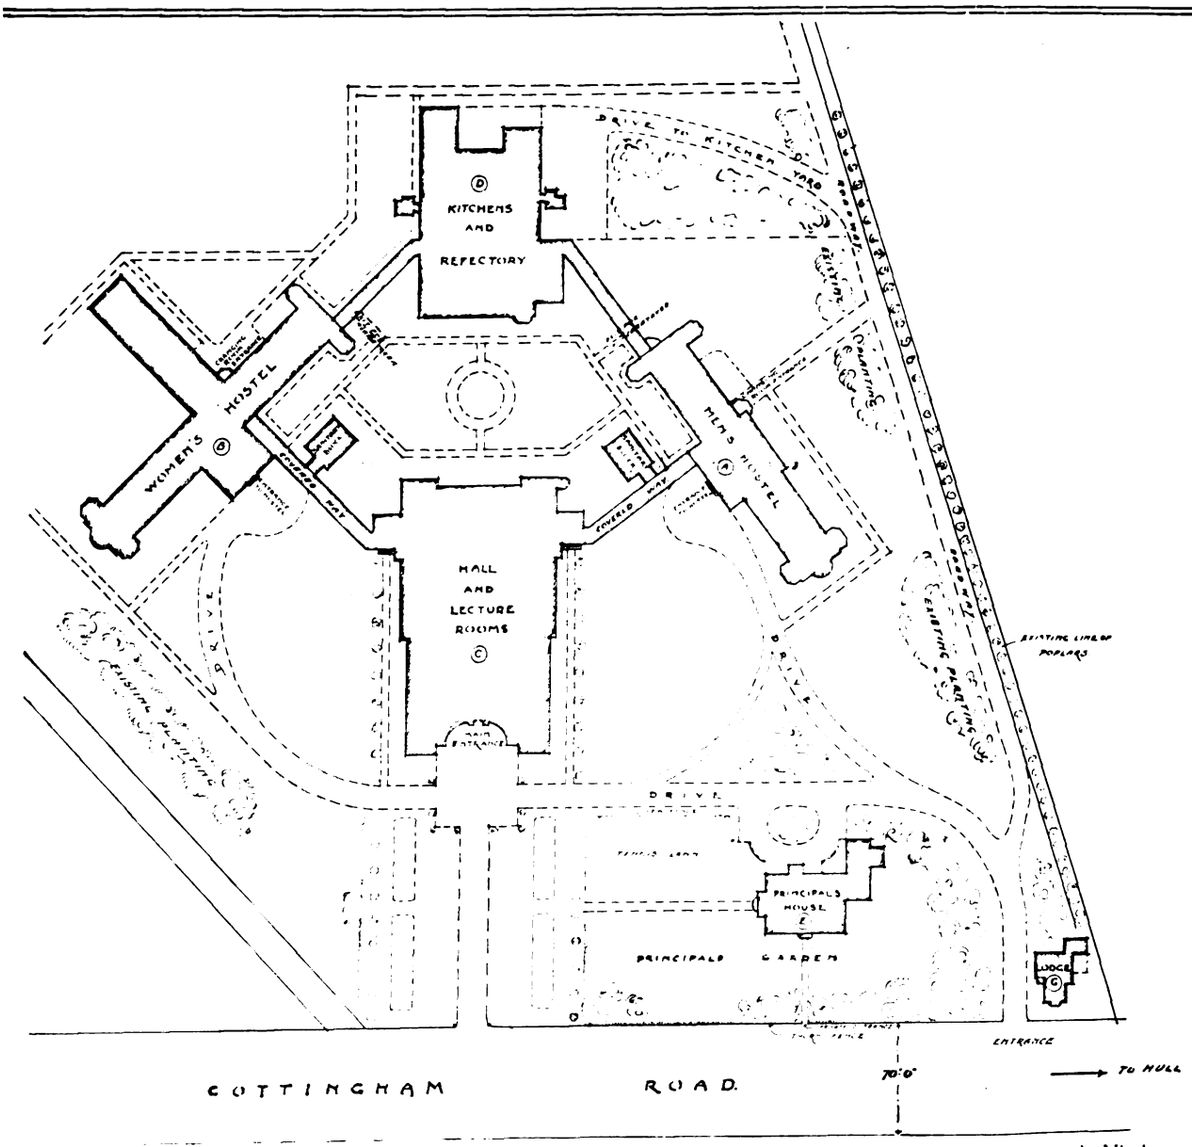
LIVING ARCHITECTS.—NO. 22, MR. JOHN W. SIMPSON, F.R.I.B.A.

MR. JOHN W. SIMPSON has filled the office of vice-president of the Royal Institute of British Architects and acted as the energetic representative of the Council in the endeavour to secure for British architects the benefits of an international law of copyright. Mr. SIMPSON has recently been elected a member of the committee of the British School at Rome.

NO. 23, MR. A. N. PRENTICE, F.R.I.B.A.



MR. PRENTICE is one of the younger generation of our prominent architects, who first made his mark as the introducer to English students of the Plateresco period of Spanish Renaissance architecture. Always an able draughtsman, Mr. PRENTICE has shown ability and originality in his designs for domestic work. His latest achievement, the fitting up of the s.s. *Orvieto*, is to be visited by the Architectural Association to-morrow.

COMPETITION DESIGN FOR TRAINING COLLEGE, HULL.

THE very carefully drawn conditions in this competition led the authors of this design to conclude that the promoters demanded a scheme embodying the greatest possible *utility*, perfection in *sanitation*, and *economy* in regard to *working expenses* more than economy in first cost. The conditions were complex: in the scheme submitted the authors venture to think that all essential points in the conditions are complied with.

Some of the advantages of the scheme are:—(*a*) The freest exposure of all parts of the building to external air

Digitized by Google

COMPETITION DESIGN FOR TRAINING COLLEGE, HULL.—Block Plan. By Messrs. G. J. & F. W. Skipper, Architects.

and sun, (*b*) most direct means of communication between all parts of the building, (*c*) the general disposition of buildings adapts itself to the peculiar shape of site, (*d*) direct supervision—no study bedrooms on ground floor—(as being objectionable in the case of a mixed college), (*e*) isolation of sanitary blocks, (*f*) the required isolation of the sick rooms, which are cut off from the rest of the hostel, having a separate staircase of their own, and being quite near to the refectory block.

The request for special spacing of desks in study rooms and in the assembly hall necessitated much larger rooms than the superficial area laid down by the Education Department. Worked out on these lines, economy was not a ruling factor; had the authors known that economy was the object to be achieved, without interfering in the least degree with the plan of their scheme, by reducing sizes and heights to the lowest possible standard, they could have effected a saving of many thousands of pounds. The price per cube foot, being fixed at the rate of 7*d.*, necessarily worked out to great disadvantage in the case of a design developed not on the most economical principles. The total cost amounted to 54,222*l.*

The architects were Messrs. George J. Skipper, F.R.I.B.A., and F. W. Skipper, of Norwich.

Church of St. Anselm and St. Cecilia, Kingsway.

This church takes the place of that which was long known as the Sardinian Chapel, Lincoln's Inn Fields, which was taken by the London County Council in connection with the forming of the new Kingsway thoroughfare. There was a tradition that the old chapel was designed by Inigo Jones, who did so much other work in the vicinity, but having been completely wrecked during the Gordon riots, and afterwards restored at the expense of the Government in apparently as cheap a way as possible, it bore no trace of any architectural character that could be thought attributable to its reputed designer. It was, however, the oldest post-Reformation Catholic place of worship in London, and existed under the protection of the Sardinian Ambassador until such help was no longer required. The new church is designed in the Early Renaissance style (as being considered most suitable to its traditions), and consists of a nave and chancel with one wide aisle on the south side, the sacristies being beneath the chancel. A feature of the interior is the rood loft beneath the chancel arch, in connection with which are two side galleries to accommodate the organ. The church accommodates about 500 people, and together with altar and furniture and a residence for three priests has cost about 12,500*l.* Mr. Fredk. A. Walters, F.S.A., of 37 Old Queen Street, is the architect; and the contractors are Messrs. James Smith & Sons, Ltd., of South Norwood.

Detail of Competition Design for Berkshire County Council Offices, Reading.

The competition for the Berkshire County Council offices was remarkable for the many excellent details submitted with the designs, two of which we illustrate this week, those by Messrs. Wenyon & Potter and Messrs. Crouch, Butler & Savage.

Oxford College Series, Brasenose.—Chapel.—Organ Screen in Chapel.

We this week complete our series of views from Brasenose College, the descriptive account of which appeared on October 1.

HOUSE DRAINAGE AND SEWAGE DISPOSAL.*

(Concluded from last week.)

COMING now to the subject of sewage disposal, although my remarks should be confined to that part of it which most concerns the architect, namely, the drainage of country houses, it may be well to say something about the general principles which should apply when adopting what is known as the bacterial system of sewage disposal, which was the first to apply in this country, deliberately and in a practical form. It is needless to say that as a matter of fact the final purification of all foul matters has been due to the work of micro-organisms from the beginning of life on our planet, and that their work has been to restore organic wastes to their inorganic elements so as again to allow of their being used for building up the life processes of plants and animals through successive generations.

On the occasion last year of giving the course of Chadwick Lectures on Sanitation at the London University I attempted to explain the processes that are now being invoked for the purification of sewage in a popular form, and, after dealing with the chemical aspects of the subject from the practical side, I endeavoured to describe the biological conditions that are necessary in order to arrive at satisfactory results. As these were put in the simplest way, avoiding technicalities as much as possible, I hope I may be allowed to make one or two quotations. There are two terms, aerobic and anaerobic, which are in constant use, for which we are indebted to the illuminating genius of Pasteur. They represent the dividing-line between two kinds of micro-organisms, viz., those than can and those that cannot live without air; but it is a line that is frequently crossed. Without going into details, it is sufficient to observe that whether or not a particular organism can or cannot work in only one or in both of these conditions, the difference between the results achieved by the two classes of bacteria is of the most remarkable kind.

The anaerobic changes come under the general term of putrefaction, and the aerobic of oxidation, but they each break down organic substances into simpler molecular forms. About the great difference that exists between the two processes there cannot be any doubt, seeing that one produces gases that can be used as illuminants, and the other, the aerobic group, those that will put out the light of a candle. The work of the two kinds of organisms, from a practical standpoint, must be judged from the effect they have in carrying on the required changes to the necessary standard of purification in any particular case, and the whole object of the process is to take the greatest possible advantage of their natural functions. Unfortunately the subject has hitherto been approached from an altogether unscientific standpoint, seeing that it has never been subjected to any method of measurement. The result has been, what must always be expected from rule of thumb, that no real progress in a scientific sense has been achieved at all, and though a Royal Commission has been sitting for more than ten years and spending large sums of money upon the collection of a vast accumulation of facts and figures, these can be of little value until they can be correlated in terms of a common standard of comparison, in comprehensible terms. In such a case an architect who is only concerned with practical results, but who is anxious to obtain some reasonable and definite knowledge such as he can obtain in other branches of his profession from text-books that deal with accurate and scientific data, may well be forgiven if he is quite fogged when a client appeals to him for advice on the subject of sewage treatment by bacterial processes, and I am afraid that if he applied to the Royal Commission on Sewage Disposal for specific advice they could only refer him to reports and minutes of evidence and appendices that would make confusion worse confounded and be altogether beyond his comprehension.

One point is fairly obvious, that an architect has to deal with the problem in one of its simplest forms because, while there are many disturbing factors in the case of town sewage by reason of trade wastes and other complications, he has to deal with it in a fairly normal and uniform condition. It follows that if any real progress had been made in the direction of a standard method of disposal the architect should have been the first to be able to take advantage of it.

Turning your attention for a few minutes to what actually does occur when micro-organisms convert organic matters into their inorganic elements, it may be well to refer you to the highest results that have ever been obtained in the purification of purely domestic sewage by bacterial processes. It happens that the information is given in a much more detailed form than in any other experiments, because the changes are shown as they actually occur during the process of filtration. They are known as the Ashtead experiments, and are clearly set forth in the table. Without going into technical details it will be sufficient to point out that the great object is to convert the polluting nitrogenous substances into the mineralised form of nitrogen as nitric acid, in which they were originally assimilated by the life processes of the plant or animal. This is done by the conversion of the ammonia, and you will see from the table that as the one of these is decreased there is a corresponding increase in the other. This may be regarded as the whole *rationale* of the process. The results were obtained by first subjecting the sewage to the action of the anaerobic or putrefactive fermentation carried on by organisms that do not require air, but assimilate the chemically combined oxygen in the organic matter itself. It was long a question as to how long this putrefaction should be allowed to continue, but as the result of experiments which I carried out for a committee of the Surrey County Council quite recently it was shown that with a well-arranged filter a wide range in the period of the putrefactive fermentation was permissible without seriously affecting the results.

The most recent installation that has been carried out on these lines has been for Messrs. Forsyth & Maule at a large country house in Berkshire. Here the sewage is first delivered into a chamber in which a deep dip-stone is fixed. The effect of this is to force the incoming sewage in a downward direction so as to allow the heavy inorganic matters to fall to the bottom, provision being made for its removal as occasion demands. The sewage overflows from the forward end of this chamber into the same kind of apparatus which I used in my Ashstead experiments, and to which I gave the name of a "cultivation-tank." The object of this arrangement is to allow the sewage to impinge upon the surfaces of stones, with which the tank is filled, and which provide a permanent nidus or resting-place for the anaerobic bacteria. Whether it is the best arrangement possible may be called in question, but at any rate it is the one which has given far higher results than any other as regards the final effluent it discharges from the filters. The sewage remains in the "cultivation-tank" for a period that depends upon the ratio between the rate of flow of the sewage and the cubic capacity of the tank, after deducting the displacement due to the flints or stones, and this must necessarily vary much longer during the night, and much less during the day, and so on. In order to meet the case of the house being empty or full, the tanks are arranged in a group of four. All irregularities are no doubt a disturbing factor, but from the recent experiments referred to a considerable range of variation makes no material change in the results. The effluent from the cultivation-tanks escapes at practically the same level as the intake, and is then carried in a pipe to a distributing apparatus, known as Fidian's, which is self-acting, and is revolved by the weight of the liquid itself, which falls evenly over the surface of the filter and discharges by its own gravity, first, through 3 feet of graded filtering material, and then through another pipe and distributor over and through another filter which was provided to meet the case of having to discharge into a river celebrated for its trout. Although this arrangement is practically the same in most respects as the one which I used partly as regards the preliminary anaerobic tank in 1892, and wholly in the Ashstead experiments in 1897, I do not think it fails in any way to give effect to the most advanced ideas of the present day, but it has one great disadvantage, and that is its cost. Although I have devoted nearly twenty years to its development and have contributed a full share of my time in attempting to put the whole subject on a more scientific and satisfactory footing, I cannot but think that in the case of country houses, at any rate, there must be some more simple and inexpensive means of arriving at equally satisfactory results. I must also admit that, although the apparatus I have described was based upon the results of long experience, it, too, has been carried out to some extent by rule of thumb, and it is a question with me as to whether it would not have been better to get the actual facts beforehand with regard to this particular sewage. The difficulty is that doing so would have entailed the employment of a chemist and the use of a testing-apparatus beforehand, which in the case of small installations would be regarded as too expensive, though in nine cases out of ten it would be far the cheapest procedure in the long run.

In towns, where millions of pounds of the ratepayers' money have been absolutely wasted upon schemes that have been approved by the Local Government Board, but have proved futile, it is a different matter, because in such schemes the cost of arriving at definite information and safe conclu-

* A paper read by Mr. W. D. Scott-Moncrieff at the last meeting of the Architectural Association.

Digitized by Google

sions beforehand would be trifling, whereas in the case of an ordinary country house it may be prohibitive.

One thing I ought to refer to is the question of nuisance arising from smell in small bacterial installations, and the other is that of the attention required to keep them in proper working order.

I have found that in cultivation-tanks and similar arrangements there is a period in their maturing that generally occurs about a fortnight from the sewage being first applied, when very offensive odours may be expected, but that this passes off in a few days and afterwards smells only occur during certain changes in the weather that are not frequent, such as when it is thundery or during a very low barometric pressure. This, of course, is not pleasant, but in the light of recent knowledge there is no reason to suppose that these odours have any really bad effect on health. Of course, this may not hold good in the case of nervous people who make up their minds that an illness and a smell are in the nature of cause and effect because they noticed a smell so many days before the illness commenced, but the experience of those who have to deal constantly with sewage works, and who are an exceptionally healthy body, shows that these smells are not dangerous. The case of Birmingham may be quoted, where twenty millions of gallons of septic sewage are being actually sprayed into the atmosphere within a short distance of the town without a protest of any kind. This is, I think, carrying matters too far, and, even if my prediction that Birmingham will one day have a rude awakening by reason of an epidemic of some sort is not realised, in any case the system is most offensive.

When these cultivation-tanks receive a little intelligent attention they go on doing their work for years without trouble of any kind. One installation occurs to me which was put down by Mr. Philip Webb about fifteen years ago in the neighbourhood of East Grinstead, and has worked quite satisfactorily ever since.

Where a sufficient fall is available and an efficient system of bacterial filtration adopted there is no difficulty in disposing of the effluent by passing it into any stream that is not used for drinking. In the case of Staines it is allowed to pass into the Thames direct from the filters. When filtration is not available it requires a very porous soil to admit of the discharge being disposed of in underground open-jointed pipes. In such cases it is better to pass it through long shallow channels on the surface of the land, though this, of course, can only be done when the necessary land is available.

I still think that some more simple devices may be found for dealing with the drainage of country houses than those which I have described, and I hope it may fall to the lot of some of the younger members of the Architectural Association to discover them.

Mr. W. H. Seth-Smith, in proposing a vote of thanks to the author of the paper, said he supposed every architect even with a few years' experience had had to deal with the disposal of sewage and drainage. To the architect it was a problem of direct and personal interest, and often it meant very great anxiety. It was said that a little knowledge was dangerous, but he wholly dissented from that opinion when they were considering such a subject as drainage. There could be no question that unless they began with a little knowledge they would never gain more, and therefore it was of immense importance that the members of the Architectural Association should get preliminary knowledge of such matters, so that as their practice increased they would become experts in the drainage of their own houses. He was interested to hear the lecturer's view as to the degree of leakage which could be discovered by the water test, and his warning or condemnation of a drainage system under the house. In clay soil it was questionable whether leakage ought to be allowed to continue, because the pipes were apt to become congested by any large amount of leakage, though they would not be justified in going to the expense of reconstructing the drain if the leakage was small. The question of the ventilation of the municipal sewer up the house drains had for architects more than one point of interest. They had all of them felt how hideous were the municipal ventilators, and they would do a great deal to banish such eyesores, but they had definite views as to the danger of allowing the sewer to be ventilated up the pipes of their houses. The most important point raised by the author of the paper for them as practical architects was the dealing with drainage in a country house and the disposal of the sewage in a small area on a small site, where there was no public sewer. He was not sure, from what they had heard, how far the instance of Messrs. Forsyth & Maule would help them on the point. He wished to know the distance between the house and the septic tank, and again from the septic tank to the aerobic beds. It was comparatively easy to adopt such a system where the distances were considerable, and he had used it in an instance of his own, where 3,000 gallons of sewage per day had to be treated. They must ask, therefore, for a little information and advice as to the best method of disposing of sewage on small sites. It was easy on a chalk soil, when a cesspool could be made 20 feet deep, but when the soil was not of that nature, even if it was soft, light sand, the system was a dangerous one, and in soft clay it was impossible.

Mr. Ernest Herbert seconded the vote of thanks, and agreed that in dealing with a moderate-sized country house they all found difficulty in the disposal of sewage. Even at the present time there was little definite information to help them decide whether they were right in adopting one of the filtration systems or whether it was not better to rely upon the old-fashioned cesspool. Personally, he preferred in the country to adopt earth closets, for, with a man to look after them, they were better than a bad water system. The point that he particularly asked the author to elucidate was the question as to what he thought was the better system to adopt in an ordinary sized house where the spraying system was prohibited. The speaker's own view was that for smaller houses, where manual labour could be used in getting rid of all that was offensive by turning over the ground into which the sewage was allowed to drain, the cesspool system was to be preferred.

Mr. F. J. Osborne Smith said the question of the defective drain, as to whether it should be renewed or not, depended, of course, very much on its position in relation to the building. If the drain ran near the foundations, and the soil happened to be clay, the leakage would certainly be detrimental to the structure. Then, again, it was not while the drains were working perfectly that trouble occurred, but when they were choked and the water test was applied. With regard to soil pipes, he was in favour of keeping them as small as possible. Referring to the drainage of country houses, the speaker said the trouble they had to deal with was, as much as anything, the intermittent flow of the sewage. The house would frequently be uninhabited for long intervals, and the whole system got out of order. If Mr. Scott-Moncrieff could give some suggestions for overcoming the faults due to an intermittent flow, they would be most useful to many architects.

Messrs. Horace White, H. W. Mann, R. A. Dibdin, and Dr. E. Stanhope Kitchin also joined in the vote of thanks.

Mr. Scott-Moncrieff, in his reply, said the difficulties of the architect were inversely proportioned to the amount of land at his disposal. The problem of dealing with sewage on a small site was extreme, and the speaker said he frankly admitted that some such system as that of Mr. Poore's could be accepted as the best solution of it. The method of the cesspool was still an unsolved problem, and in the neighbourhood of a sufficiently closely inhabited district, the author thought a public system of drainage was the best arrangement to adopt.

THE SOCIETY OF ARCHITECTS.

A MEETING of the Society of Architects was held on Thursday evening, the 11th inst., Mr. G. E. Bond, President, in the chair.

Mr. T. R. Richards, F.R.I.B.A., hon. auditor, made a report on the revenue account and balance-sheet. Taking into consideration, he said, the fact that the past year had been exceedingly bad from a business point of view, and that the Council, recognising this, had written off many debts for arrears, it might perhaps be a matter for congratulation that the Society was able to show an increased revenue from its main sources of income and also a very considerable surplus for the year.

On the motion of the President the balance-sheet was formally adopted.

The President then delivered an address, the full text of which was published in *The Architect* of November 12.

Mr. F. Eedle moved a vote of thanks to the President.

Mr. Ellis Marsland seconded the motion and congratulated the Council of the Society on the spirit it had shown in tackling successfully the question of new premises. In their new home they would be able to conduct the business of the Society with greater efficiency, but he impressed upon the members the need for a hall for holding their meetings, and urged them to complete the new building in that respect. Referring to the President's remarks on registration, he said that looking back on the attitude of the Institute it was curious to

Digitized by Google

remark how every year brought them nearer to the views of their Society on that subject, and in time he believed the Institute would adopt the proposals contained in the Bill in their entirety.

Messrs. C. P. Monson, C. H. Mead, David Morgan and G. A. Birkenhead also joined in the vote of thanks to the President.

EGYPT EXPLORATION FUND.

THE twenty-third ordinary general meeting was held at the rooms of the Royal Society on Friday last, the President, the Right Hon. the Earl of Cromer, in the chair, when the members of committee and other officers were elected. The report of the Hon. Treasurer was read, and the President delivered his address. Lord Cromer said:—

Gentlemen,—I feel that I owe you some apology for addressing you at all on the present occasion. A great English novelist and scholar, Thomas Love Peacock, once said to a friend, "Don't talk to me of anything that happened less than 2,000 years ago; it is not worth knowing." I fear I cannot nearly attain to Peacock's high antiquarian ideal, for, in fact, during my long connection with Egypt my time was so fully taken up with the affairs of to-day that I had but little leisure at my disposal to study the history of the remote past. I had, however, at times a good deal to do with what I may term the administrative side of Egyptology, and I will presently refer more precisely to some of the difficulties which had to be encountered in treating this aspect of the question. First, however, let me allude briefly to the great and satisfactory change which during the last few years has taken place in the interest which this subject evokes amongst our own countrymen. When I first went to Egypt, now more than thirty-two years ago, Egyptology was a sealed book save to a very few Englishmen. Since then a whole school of British Egyptologists has sprung into existence, some distinguished by the trained intelligence and perseverance which they have brought to bear on the work of excavation, others by the learning and research which they have displayed in interpreting the history of the past. The names of Petrie, Sayce, Naville—whom we may almost claim as a countryman—Budge, and many others will readily occur to you. Younger men are treading in the footsteps of these veterans—Lyons, whose departure from Egypt is a great loss in many ways, Griffith, Newberry, Hunt, Grenfell, Quibell, Weigall, and others. These have gone hand in hand with those representatives of the Anglo-Saxon race who live on the other side of the Atlantic, for instance, with Davis and Breasted.

These, gentlemen, are satisfactory symptoms. We are no longer in the ruck, but in the van of that learned and inquisitive army which is advancing with the fixed determination to discover whatever secrets the sands of Egypt have still to reveal. Then, gentlemen, there is another change which has perhaps not yet taken place, but of which I am sanguine enough to hope that the dawn is not far distant. It may confidently be stated that the time is gone, never to return, when any indigenous Egyptian authority would suggest such an act of vandalism as the employment of the massive blocks of the pyramids in the construction of a dam on the Nile. The spirit of modern Egyptian government is more accurately symbolised by the unfeigned regret displayed by the various authorities concerned when the cruel necessities of engineering obliged them at Philæ to choose between the alternative of respect for the work of past and neglect of the interests of present and future generations. Never again can there be any question of applying portions of those beautiful mosques, which Herz Bey has done so much to preserve and restore, to such ignoble services as forming the lintels and doorposts of some *café restaurant*.

Gentlemen, there is no surer barometer of the progress a nation has made than the extent to which it takes an interest in its past monuments. It has been truly said that men never begin to study the antiquities of their country till they are saturated with civilisation. Well, gentlemen, modern Egypt is now so far saturated with civilisation that the advance in material prosperity during the last quarter of a century has been unexampled in the history of the world. The foundations of all that we call civilisation have been well and truly laid. Moral advance naturally lags behind, and limps painfully onward, like prayers following on sin in the famous metaphor of Homer. But it is not too much to hope that in the earnest, though perhaps at times somewhat erratic, endeavours now being made by the present race of Egyptians to rise to higher ideals than any which would have been cherished by their forefathers, they will not forget the claims of their historic past. I trust that in no very distant future it may be possible to include some Egyptians in the category of distinguished Egyptologists.

And now, gentlemen, I turn to another point. I have said that I have had at times a good deal to do with the administrative side of Egyptology. Let me say in this connection that I do not think that in the course of my long connection with Egypt I remember a single question of importance arising which it was possible to treat exclusively on its own merits. If some change was proposed in the fiscal or judicial system of the country to which the assent of the Powers was necessary—and in most cases of importance their co-operation was indispensable—considerations which at first sight appeared not even remotely connected with the special point under discussion had to be taken into account. At one time an eye had to be cast on the relations between the British and German Governments in the distant Pacific Ocean. At others, French policy in Madagascar, or Italian policy in connection with Abysinnia, might have to be weighed in the balance. As was to be expected, questions of a different character to those which attracted attention in the early days of the occupation are now acquiring some prominence; but it cannot be too clearly understood that throughout the preliminary period of Egyptian reform, which lasted for wellnigh all the years during which I held office, the main difficulties which had to be encountered arose from the cosmopolitan character of Egyptian institutions, and from the diverse and often conflicting interests of non-Egyptians in Egyptian questions. The fact was unfortunate, but nevertheless practical men had to recognise its existence. That even Egyptology could not escape from this taint was abundantly proved by the negotiations which took place in 1904. Dead Pharaohs were able to revenge themselves for what they would have considered the desecration of their tombs by casting the apple of international discord amongst those who disturbed their ancient solitary reign. I am aware that it is held by some whose opinions are entitled to respect that in the course of the negotiations of 1904 Egyptology was to some extent sacrificed to policy. That Egyptology had to be considered in the course of those negotiations I readily admit, and I may add that I make the admission with some regret, for personally I favour the opinion that all matters connected with endeavours to add to the stock of knowledge of the world should be kept wholly outside the domain of politics. But I altogether demur to the statement that the interests of Egyptology were sacrificed. Consider what has happened. At the instance of the French Government, an engagement was taken that the head of the Archæological Department in Egypt should always be a Frenchman. Was this an excessive demand on the part of the French? I cannot think it was. The French were really the fathers of Egyptology. It surely was not surprising that national pride should have been evoked in maintaining some supremacy in a branch of knowledge rendered illustrious by the names of Champollion, Mariette and others. Would it not have been, to say the least, ungenerous to deny the validity of this claim at a moment when, in spite of every effort to avoid friction, a proud and sensitive nation was wincing under what they considered a loss of predominant influence in Egyptian affairs? I think it would have been so, and for my own part I may say that it was real friendship, rather than political necessity, which impelled me to advocate this concession. Nevertheless, had I thought that the essential interests of Egyptology would suffer, I should have withdrawn my advocacy. But in what way can those interests suffer? We have a right to expect two things of the French, and my firm hope and belief is that in neither shall we be disappointed. In the first place we have a right to expect that the head of the Archæological Department shall be a man well fitted to fill the post, both as regards knowledge of Egyptology and in respect to other qualifications. I do not suppose that France, or, indeed, any other nation, is suffering from what I may call a plethora of Masperos; but although it may be difficult to find anyone endowed with the very special qualifications possessed by the very distinguished Director-General of the day, I see no reason to doubt that on his retirement, which I hope is still far distant, his mantle will fall on the worthy shoulders of a countryman trained in his own school of learning, conciliation, and liberal thought.

The other thing which we have a right to expect is that there shall be no exclusiveness either in appointments to the Archæological Department or in the treatment of unofficial explorers—in other words, that the traditions of M. Maspero, or I should rather give him his well-earned English title, Sir Gaston Maspero, shall be continued. I hope and believe that in this respect we shall not be disappointed.

Gentlemen, it may perhaps be thought that I am not an impartial witness on this subject, for I frankly confess that I

Digitized by Google

know more of politics than I do of Egyptology. Moreover, I regard the Anglo-French agreement of 1904, followed, as was anticipated, by the friendly understanding with Russia, as the most important incident connected with the foreign relations of Great Britain which has taken place for many years past. I shall always look back with pride and satisfaction to the fact—which you will perhaps pardon me for mentioning—that for more than twenty years I laboured incessantly, through good and evil repute, to create a state of things in Egypt which facilitated the conclusion of that agreement. The very numerous critics of Egyptian affairs who dwell on the shortcomings in Egyptian reform—shortcomings of which none are more aware than myself—perhaps hardly lay sufficient stress on the very serious evils which would certainly have arisen had impatience at the obstacles to reform been allowed to predominate, and had any attempt been made to cut the tangled knot of Anglo-French petty dissensions instead of slowly and laboriously unravelling them. But for all that it would be a matter of unfeigned regret to me if I thought that these advantages had been gained at the cost of sacrificing those very important objects in which the audience I am at present addressing are specially interested. I trust that the observations which I have ventured to address to you may serve to remove from your minds any impression that such a sacrifice has been made.

The work of the Society during the past year was summarised in the address of the Hon. Secretary (Mr. J. S. Cotton), who first referred to the losses by death that the Society had sustained, particularly Mr. Frederick George Hilton Price, the late President, and Lord Amherst of Hackney. The Hon. Secretary said:—

As regards the Egypt Exploration Fund proper, you will recollect that in 1907-8 we had no expedition; but we started some excavations again last winter on a concession at Abydos, under the direction of M. Naville, with the assistance of Mr. Ayrton and Mr. Loat. The work at Abydos itself consisted mainly in clearing and preparing ground for the coming season. A large piece of untouched ground on the south of the tombs of the Old Kingdom, and behind the temple of Rameses II., was dug over, and the remains of two roads, formed of late pottery vases laid in long parallel rows, were discovered, and several small objects were found. Further, the upper edge of an immense trench was traced, which it is hoped may prove to be an analogous construction to that discovered seven years ago behind the temple of Seti I., the so-called Osireion, partly excavated by Professor Petrie, and described by Miss Murray. This new trench lies in the axis of the temple of Rameses II., just as the Osireion lay in the axis of that of Seti. To the north of the temple of Rameses were found the remains of a Coptic church, built on the foundations of a small temple of Thothmes III., which we shall clear out in the coming season. A cemetery of the Vth Dynasty of some four hundred graves was cleared, and yielded a variety of objects, including a considerable number of copper vessels.

Whilst these excavations were proceeding, information was received through native sources that a pre-dynastic cemetery was being plundered at El-Mahasna, some eight miles north of Abydos. So soon as the necessary permission from the Egyptian Government had been procured, the camp was moved thither, and in the space of a month the cemetery yielded a large number of objects of the greatest interest, many of which were on view at our exhibition in July. Among them was a pottery vase, with hippopotami moulded in relief on the rim, and another with painted hippopotami; a group of important ivories, including figures of men and animals; vases, wands, bracelets and combs, slate palettes, and a copper harpoon. The last-named object is of great interest, since by carefully dipping the end into paraffin wax it was proved that a rope had been attached to the head, as in the familiar hieroglyph for *wa* "one."

The other two branches of the Fund, the Archæological Survey and the Græco-Roman Branch, had no expeditions in the past year. The former was allowed to lie fallow, as we had completed the work at El Amarna, and Mr. N. de Garis Davies had taken over work for the Metropolitan Museum of New York, and there was sufficient material for publication on hand. It was desirable, moreover, to accumulate funds before proceeding to a new field of survey, to which I shall have to refer later on. The Græco-Roman Branch has also been inactive owing to the illness of Dr. Grenfell, which has thrown so much work on his colleague, Dr. Hunt, that it was impossible for him to go out. This Branch also will, however, resume work in the coming winter.

I will now briefly report on the work that has been done by other Societies and workers in Egypt during the past season. It has been a rather quiet year. There has been no sensational discovery, but plenty of solid work has been done.

The Egyptian Service of Antiquities has expended its energies largely on the survey of Nubia, which was rendered necessary by the decision of the Government to raise the dam at Assouan. It was continued by Dr. Reisner, and carried southwards a little beyond Kalabsha. Then he resigned his position as director, which was taken over by Mr. Firth, who has since continued the survey to Koshtamna, sixty-five miles south of Shellâl, leaving about forty-five miles still to be surveyed. Their work has consisted chiefly in exploring cemeteries of various dates from quite early times down to the New Kingdom, after which there is little evidence of remains till Ptolemaic times. Valuable ethnographical results are promised. Besides this, Signor Barsanti has carried on the work of repairing and strengthening the temples in the same region which have been so much neglected in the past, and are now threatened with destruction by drowning. Unhappily, archæologists who have been there recently do not give very favourable reports of the way in which the restorations have been carried out. Scholars of various nationalities—M. Gauthier, Dr. Roeder, and Messrs. Blackman and Dixon—have been engaged in copying the inscriptions.

At Thebes Mr. Weigall has continued his admirable work of protecting the existing monuments and enlisting the interest of the natives in their preservation. At Karnak M. Legrain has been hard at work with his re-erection of the fallen columns in the hypostyle hall of the temple of Amon. It will soon be restored very nearly to the state in which it was in the time of Rameses II.

Further north, at Saqqara, Mr. Quibell has devoted his season to uncovering the monastery of Apa Jeremias. A space of nearly four acres has been excavated, presenting a mass of irregular buildings, which date from about A.D. 520 until their final destruction, probably in the eighth or ninth century. The earlier architectural work was very fine, and is displayed in a large number of capitals and sculptured blocks of great beauty in themselves, and of importance in the history of art, as their material shows them to be of local workmanship. Two churches have been found: a small earlier one, in which the capitals were all of the Corinthian type, and which seems to have been converted later into a burying-place for the archimandrites and other principal officials. In the later and larger church the capitals offer a great variety of details, and approximate in type to the Byzantine style, as seen in St. Sophia and at Ravenna. The largest room found was the great refectory, a hall 22 by 13 metres, with a small chapel to the south-east, once separated by a wooden screen. The floor of the room was almost untouched, and on it were many inscriptions, often merely names, with the prints of men's feet cut in the stone. These must have marked the places where the brethren stood or squatted at meals. In an open paved yard south of the refectory was a pulpit, much like the Arabic *mimbar* in appearance, and probably its ancestor. A series of cells of monks was found. Some of the monks seem to have had more than one room; in this case it was the inner room that contained the prayer-niche or oratory. A considerable number of wall paintings have been uncovered, which will afford material for the future historian of Coptic art. Among the inscriptions found is a list of feast days for the year, with the allowance of wine for each feast. Unfortunately, no MSS. have yet been discovered, though this monastery must have been one of the most important in Egypt. Doubtless its proximity to the capital exposed it to an early and too thorough destruction at the hands of the Arabs.

Among English expeditions, the most important work was done by Professor Flinders Petrie for the British School of Archæology in Egypt. He worked with success on two sites, first at Gourneh, on the west bank of Thebes. There, on the top of the cliffs, was found a chapel of King Sankhere of the XIth Dynasty, which Professor Petrie believes was erected on the occasion of the King's Sed festival. He also discovered a new temple-site of the XIXth Dynasty, and a remarkably complete and interesting burial of a lady of the XVIIth Dynasty, one of the finest untouched private burials ever found in Egypt. He further found some new painted tombs, one containing an interesting group of dancing girls of the XVIIIth Dynasty. Later in the season Professor Petrie moved to Memphis, where he discovered the palace of Apries (the Pharaoh Hophra of the Bible). It is a building 400 feet long by 200 feet wide, with walls preserved from 10 to 15 feet high. The middle court is well over 100 feet square, and the stone columns in it were over 40 feet high. The stone-lined halls, of which seven remain, were over 40 feet long and half as wide. The brick halls were nearly

Digitized by Google

as large, and the walls were about 15 feet thick. A still larger court extended on the north side, in which lie capitals of columns which must have been about 50 feet high. In spite of the difficulties with water, &c., the work at Memphis promises to yield results of the greatest importance for Egyptian history.

At Abydos Professor Garstang dug through several cemeteries, and discovered a number of objects of interest belonging to almost every period from the IInd Dynasty to Ptolemaic times. They include fine alabaster vases from the VIth Dynasty and a set of coppersmith's tools and utensils, two good XIIth Dynasty daggers, and some gold jewellery of the XVIIIth Dynasty.

America has furnished the sinews of war for several undertakings. In Nubia Dr. Randall MacIver and Mr. Woolley conducted excavations for the University of Pennsylvania, and explored an XVIIIth Dynasty town opposite Wady Halfa. Within the town walls they found some graves of the XIIth Dynasty, one of which yielded a fine collection of jewellery, while another produced the earliest iron weapon recorded from the Nile Valley. It is a socketed, leaf-shaped spear-head, about nine inches long. This work is unfinished, and will be continued in the coming season.

At Thebes Mr. Theodore Davis prosecuted his researches in the Valley of the Kings. In a tomb which appears to have belonged to a noble of the reign of Tutankhamen and Ay he found an alabaster figure of the deceased man, executed in a modified El Amarna style; while on some fragments of gold foil Tutankhamen himself is depicted in his chariot slaying Asiatics.

At Thebes, too, Mr. N. de Garis Davies has commenced a great work for the Metropolitan Museum of New York. He proposes to copy the more important private tombs in full and in exact facsimile, and where advisable in colour. He has already made good progress, as he has completed the tomb of Thotemheb, and has some two-thirds of the charming little tomb of Nekht in colour and to full scale. This tomb will be vividly remembered by all who have visited the Theban necropolis.

The Metropolitan Museum was also responsible for the work of Messrs. Lythgoe and Mace at Lisht, where the XIIth Dynasty pyramids and tombs are being carefully explored. Mr. Lythgoe, further, has excavated an extensive Coptic cemetery in the oasis of Khargeh.

Germany has been represented by an expedition to the Fayûm in search of papyri, and Dr. Zucker has taken back to Berlin a considerable collection discovered on the site of the ancient Philadelphia. A very useful work has been accomplished by Professor Schäfer and Dr. Junker, who have made a complete set of copies by photography and otherwise of all the inscriptions on the Temple of Philæ, the original records being doomed to disappear before very long.

Such are the principal results of the season's work. And now I will say a few words as to our forthcoming publications. For the Fund proper we shall shortly publish a final or possibly two volumes on the XIth Dynasty temple at Deir-el-Bahari, giving full architectural plans and details; and later on a volume by Mr. Ayrton, giving an account of the results of the work at El-Mahasna.

For the Archæological Survey the next volume will deal with the first results of Mr. Griffith's work in the Sudan, to which I shall refer immediately.

The Græco-Roman Branch will be represented by another volume of *Oxyrhynchus Papyri*, number VII. of the series I need say no more as to this, as you will have the advantage of hearing Dr. Hunt tell you something about it this afternoon.

And lastly, I have a word to say on the work that we propose to carry out in the coming winter.

Our principal effort will be at Abydos, where we shall have an expedition under the direction of Professor Naville as heretofore. I regret that we can no longer avail ourselves of the services of Mr. E. R. Ayrton, who has done such excellent work for us during many years, as he has accepted an important archæological post from the Government in Ceylon. We have secured a successor to him in Mr. T. Eric Peet, an archæologist with a wide knowledge of Italian and Ægean antiquities, as he has shown by his recent important volume on the Stone and Bronze Ages in Italy. He has had a training under Professor Garstang in Egyptian work, and has worked with him at Abydos, so that he is well acquainted with the ground, and will be in a position to take up the work at once with a full knowledge of the local conditions, and we may look forward to a prosperous season there. I may add that Mr. Peet was a Craven Fellow at Oxford, and has recently been elected the first Pelham Student in that University. He will have Mr. J. A. Dixon as assistant. M. Naville is here, and has kindly undertaken to fill in the details of the proposed campaign.

For the Archæological Survey we are entering on a new phase. As you know, for some years Mr. Davies was occupied for the Survey in reproducing the paintings in the private tombs of El Amarna. His records will be of permanent and very great value, as the originals are rapidly disappearing. He completed his admirable work with the sixth volume of "El Amarna," and he has now passed into the service of the Metropolitan Museum of New York. So we have had to look out for a new field. It was felt that as England had made itself responsible for the development of that great tract of country which lies south of Egypt proper, viz. the Sudan, and as the Sudan contains a number of antique remains belonging to races which for centuries were subject to Egypt and were imbued with Egyptian civilisation, it would be very desirable that our Society should take a share in working out these relics of the old Meroitic empire. The inscriptions of these remains are partly in Egyptian, that is the ordinary hieroglyphic, and partly in a language which has so far not been deciphered, but is written in two scripts, one a peculiar form of hieroglyphs, and the other a cursive character.

Recent finds have largely increased the number of Meroitic texts, and only three or four months ago Dr. Budge published the facsimile of a MS. recently acquired by the British Museum in the same cursive script; the subject of the work is guessed at with probability, but the MS. has not yet been deciphered. A complete decipherment of these old monuments of the kingdom of the Upper Nile would open a new and interesting chapter of history. Mr. Griffith, to whom the Survey is so much indebted in every way for years past, is now on his way to the Sudan for the purpose of collating the old and acquiring fresh Meroitic material; and he proposes to make this material and the resulting investigations the work of the Survey for the next two years. He is already well on the track of reading these inscriptions, and I believe there is little doubt that his efforts will be crowned with success.

With regard to the Græco-Roman Branch, we are proposing, as Dr. Hunt is prevented from going out himself, to send an expedition under Mr. A. M. Blackman and Mr. J. de M. Johnson to dig for papyri in the district between Behnesa and Ahnas, more familiarly known to you perhaps as Oxyrhynchus and Heracleopolis. Mr. Blackman has already worked under Drs. Grenfell and Hunt in the Fayûm, besides having considerable archæological experience in other parts of Egypt. Mr. Johnson, who has also had experience in Egypt in a civil department, was recently elected to a Senior Demyship at Magdalen College, Oxford, and proposes to devote himself to the study of papyrology.

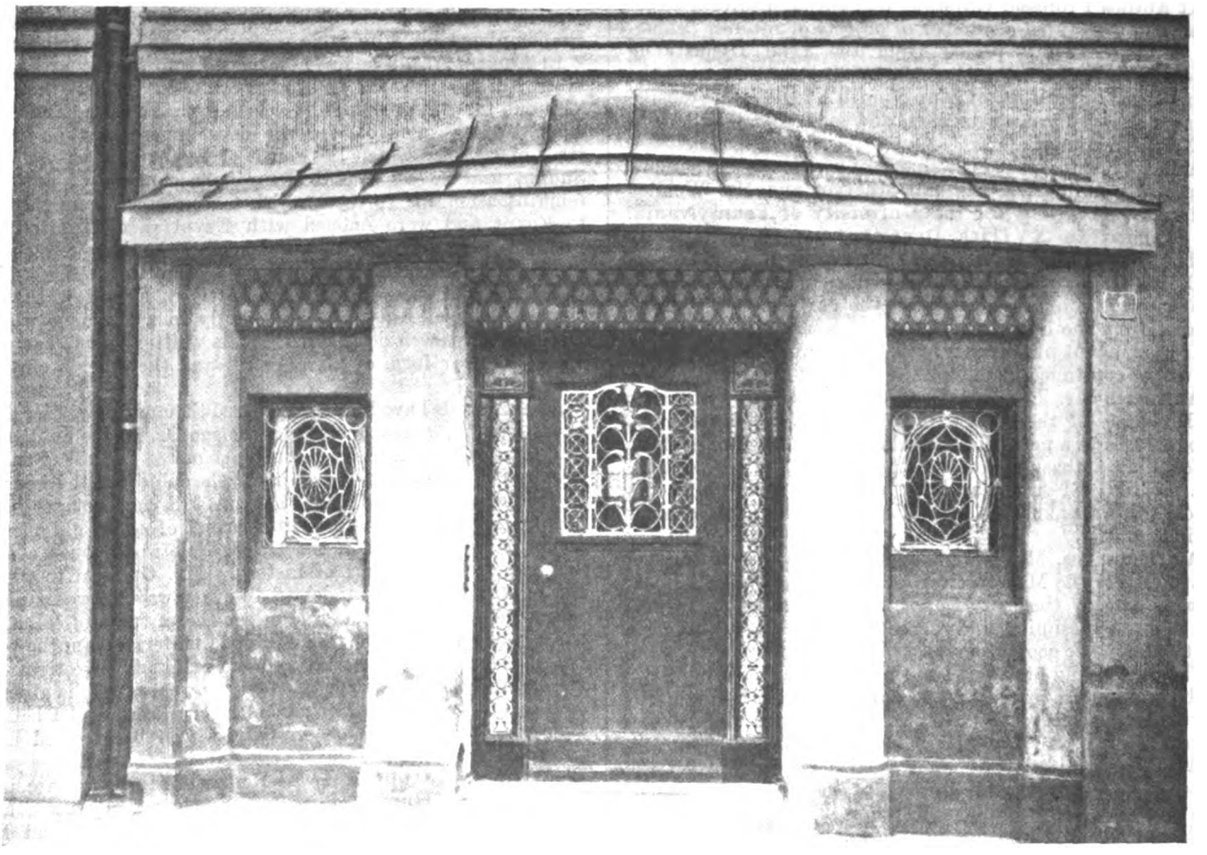
This concludes what I have to say to you this afternoon, and now it only remains for me to thank you for listening so attentively.

Addresses by Dr. Hunt on the work of the Græco-Roman Branch and by Professor E. Naville on the excavations at Abydos were also delivered.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the annual gathering of the Society at the Queen's Hotel, Leeds, on Thursday evening, November 11, Mr. Percy Robinson, F.R.I.B.A., delivered his presidential address. He said:—

In the first place I must express my thanks to you for electing me to this honourable position, and I can assure you that I shall continue to use my best endeavours to carry out the duties of the position so as to promote the interests and welfare of our Society.



You will see from the Secretary's report that we are still maintaining our steady progress. Our membership is greater than ever before, and our financial position is as sound as ever, whilst the attendances at our lectures and meetings continue to show a marked improvement.

Amongst the events of the year locally I may mention the Health Congress which was held in Leeds under the auspices of the Corporation and University, acting in collaboration with the Royal Sanitary Institute and the Royal Institute of Public Health, when 1,100 delegates assembled to exchange their views on the various aspects of sanitary science. Your Council took an active part in assisting with the organisation, and one of our members, Councillor G. F. Bowman, was appointed chairman of the engineering and architectural section.

DETAIL OF ENTRANCE TO BLOCK OF FLATS, AUGSBURG.—Krauss & Durr, Architects. [From *Der Profanbau.*

As your President I was invited to deliver an address, and selected as my subject "Some Aspects of Town Planning in Relation to Health," in which I took the opportunity of advocating the importance of due consideration being given to the artistic side in all city development, pointing out the relation or interdependence of beauty and health and the influence of environment upon the mind and life of the people.

Amongst other papers bearing more directly on architecture was one by Dr. Fremantle on Letchworth Town Planning. This was followed by an interesting discussion, in which Mr. E. T. Hall, V.P.R.I.B.A., and Mr. R. T. Kirkby, A.R.I.B.A., and other architects took part.

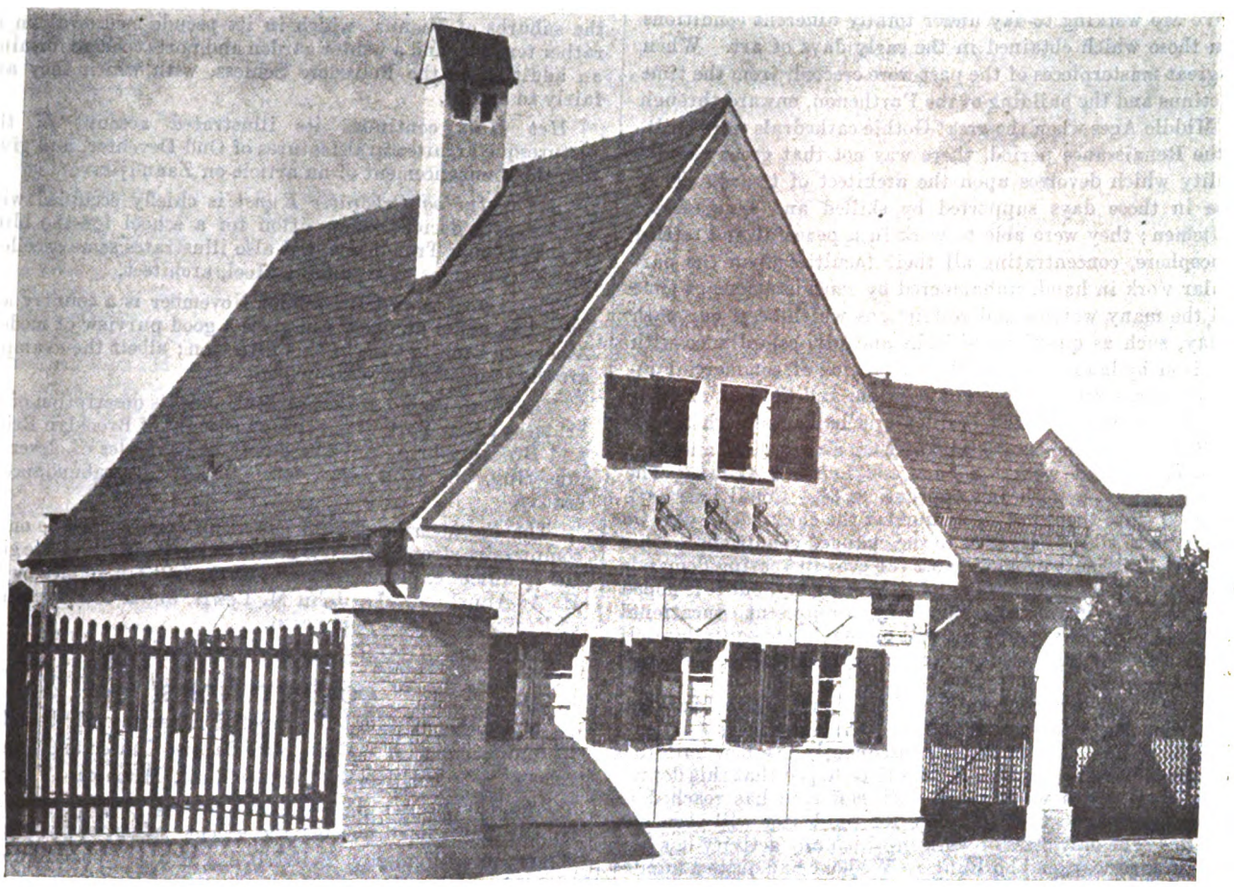
The question of town planning still looms large upon the architectural horizon.

During the year a deputation of German town planners has visited this country and was received by the R.I.B.A. A large number of English architects and municipal representatives interested in town planning have also visited the principal Continental cities in order to study the methods in vogue there and gain some idea of the results that have been obtained.

One of the most notable events in this direction during the past year has been the endowment of a chair of civic design at Liverpool University through the generosity of Mr. W. H. Lever, the founder of Port Sunlight and one of the pioneers of this movement.

Mr. S. D. Adshead has been appointed the first professor, and we have been fortunate in securing his services to deliver a lecture during the coming session on this question of town planning, when I trust, in view of the importance of the subject, we shall have a large attendance not only of our own members, but of municipal representatives and others interested.

The Town Planning Bill is still before Parliament and is receiving the usual buffeting about which invariably falls to the lot of controversial matters or legislation introducing new principles and ideas. It is to be hoped, however, that the Bill will not be sacrificed to meet the exigencies of the political situation, because whatever opinions there may be upon the methods of procedure and minor details, there is no doubt that the vital principle is good, and we as architects ought certainly to endorse it.



Speaking on this matter last year I suggested that the local advisory committees proposed to be formed in connection with town planning schemes might be useful not only in connection with the immediate object in view, but that the scope of their work might well be extended to watching over the artistic amenities and evolution of our towns and cities in other directions. This idea has taken a concrete form in New York, where, at the instance of the late President, Mr. Roosevelt, following a suggestion made by the American Institute of Architects of Washington, a Council of Fine Arts has been created, and directions have been issued that for the future "before any plans are formulated for public buildings or grounds or for the location or erection of any statue," the heads of executive departments, bureaus, and commissions must submit the matter to the Fine Arts Council and follow their advice, "unless for good and sufficient reasons the President directs otherwise." We have in such an action as this evidence not only of the enterprise of our brethren across the seas, but of their growing appreciation of architectural art, and it is an example that we might copy with advantage.

Leeds, like many other cities, has grown in a haphazard fashion without any definite plan of development, and as a result we are suffering in all directions at the present day from this lack of foresight. We have dog-legged streets wandering about in an apparently aimless fashion and leading to nowhere in particular. We have our public buildings scattered about in all directions and cramped up on ill-considered sites. Our library and art gallery in a back street, and our latest acquisition—the statue of Queen Victoria

A PORTER'S LODGE.—KRAUSS & DÜRR, Architects. [From *Der Profanbau*.

—is stranded on its pedestal in a desert of cobble pavement without any relation or connection with its surroundings. All this is due to the lack of a properly thought-out comprehensive scheme in the beginning.

Civic art has even a commercial value quite apart from the influence it may have on the lives of the citizens. This fact is usually lost sight of by the man who is absorbed in business pursuits: he fails to realise that it pays to have beautiful streets and beautiful cities, but such is undoubtedly the case, and if Leeds is to become the shopping centre of the North, which is the ambition of our tradespeople, it is well that they should bear this in mind and do all in their power to render it attractive.

Then, again, had our cities been developed on town-planning lines, there would have been other and more tangible results which would appeal more directly to the average rate-payer. Enormous sums of money would have been saved which have been spent in street improvements and in undoing what has been done, whilst profits might have been made from the acquisition of undeveloped land. In several German cities no rates are levied, because long ago they foresaw the direction of the growth of the suburbs, acquired land for new thoroughfares, and bought cheap land, the rent of which now pays for the public services.

If we were able to start *de novo* with the assistance of a Town Planning Bill and the advice of a committee, such as has been suggested, we might produce a very different Leeds from that which exists to-day, but our efforts are perforce restricted to making improvements as opportunities arise. Much good work has already been done in this direction. The centre of the city has undergone a considerable transformation of late years, and at the present time a great area of insanitary buildings is being demolished and the district remodelled under the guidance of one of our members, Councillor G. F. Bowman, who is chairman of the development committee.

The work executed by our students shows a distinct advance year by year not only in draughtsmanship and a grasp of constructive principles, but it shows evidence of independent thought, new ideas, and, above all, ambition. The future of our art is in the hands of youth, and youth without ambition is an empty vessel; it is therefore encouraging to see these signs of new developments and the setting up of new ideals. Whilst we must recognise that we cannot cut ourselves entirely adrift from tradition, that the study of old work must be our starting point, yet we must also remember that it is only a means to an end, and not the end itself. Raking up the dry bones of the past will never produce a living structure, but we may draw upon the past so far as it will help us to solve the problems of the present and enable us to devote our strength to scaling new heights of achievement.

The desire for distinction of some kind tempts one at times to leave the beaten paths and to enter on experiments in new and unfamiliar methods. Such a course demands courage and inevitably leads to many risks and disappointments, but its tendency must be good in that it implies a desire for progress, and it is possible that this spirit which permeates the rising generation of architects, combined with the introduction of modern conditions and methods of construction which demand something outside the traditional forms of expression, may be the means of carrying forward our art in a manner comparable in some degree with the most active periods of architectural evolution.

The greatness of Greek art is due partly to the fact that it was not fettered by tradition, but was free to develop in the way that suited it best, and to establish its own principles, and partly to the favourable conditions and spirit of the age. The Greeks lived in a beautiful world which influenced and found expression in their works. But there is beauty in every age; even now in our restless modern life beauty is to be found by those who seek it, and the student cannot set himself a greater ideal than to produce an architecture true to and expressive of the life of to-day, to grapple with the com-

Digitized by Google

plex and difficult problems which arise out of these modern conditions, and turn what appears to be a restriction into an advantage, to mould his difficulties into success, and triumph over his imposed conditions. This is the spirit which, if constantly pursued, is bound eventually to lead to achievement.

We are working to-day under totally different conditions from those which obtained in the early days of art. When the great masterpieces of the past were erected, from the time of Ictinus and the building of the Parthenon, onward through the Middle Ages when the great Gothic cathedrals were built, to the Renaissance period, there was not that great responsibility which devolves upon the architect of to-day. They were in those days supported by skilled and sympathetic craftsmen; they were able to work in a peaceful and settled atmosphere, concentrating all their faculties upon the particular work in hand, unhampered by considerations of time and the many worries and restrictions which beset our path to-day, such as questions of light and air, compliance with cast-iron by-laws, meeting the exigencies of commercial requirements, economy, speed of erection, and the host of other considerations which now perplex and baffle the architect.

Ruskin says the choir stalls at Amiens cost 400*l.* and kept some eight good workmen busy for fourteen years. The carvers got 1*s.* a week and apprentices 8*d.* Conditions have changed since then, but we cannot set the clock back. All we can do is to adapt ourselves to the changed conditions. This becomes a difficult problem with the ever-increasing demands which are imposed upon the architect of to-day, but it is hoped that with the advantages offered by our present educational system the budding architect will be enabled to equip himself in the best possible manner to cope with the difficulties which lie before him.

The past year has been one of the worst which Leeds has experienced, so far as the building trade is concerned, for a long time past, and there are consequently few new buildings of importance to chronicle. It is to be hoped that this depression from which we have all been suffering has reached its lowest point and that a change for the better will soon take place. The only class of work in which any activity has been shown is educational buildings. We have had quite a number of competitions for secondary schools, and in schemes on a larger scale we have had an important competition for a training college at Hull, which has been won by Messrs. Crouch, Butler & Savage, Mr. Thorp being placed second.

In conclusion, I think that although we have had a somewhat barren year from the financial point of view, we have done some good work in promoting the objects for which the Society was formed, and as regards the future of our art the prospect was never brighter.

The President was thanked for his address on the motion of Mr. Butler Wilson, F.R.I.B.A. In seconding the motion, Mr. Bowman took exception to the President's commendation of the Town Planning Bill, a measure which he, personally, regarded as having been framed by a body of gentlemen possessing little knowledge of town planning, and, as such, of little use to a city like Leeds.

The proceedings terminated with a successful smoking concert, which was warmly appreciated by numerous members and friends present.

During the evening the prizes awarded in the Society's annual competitions among the students were distributed.

OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* contains a third paper on the Architectural Exhibition at the Brooklyn Museum, by Mr. Wm. H. Goodyear, in which he deals further with the deviations in measurement from the normal at Pisa Cathedral and the leaning tower. The illustrations comprise a charming country house near Radnor, Pa., in the "colonial" manner, by Messrs. Cope & Stewardson; a house for the Superintendent of the State Hospital for Insane at Norwich, Conn., by Messrs. Cudworth & Woodworth, and the new Washington Hotel, Seattle, a "skyscraper" by Messrs. Eames & Young.

La Construction Moderne describes and illustrates the Florentine tribune containing the statue of David and other works of Michel Angelo. Other illustrations are a sepulchral monument at Père Lachaise, by M. Rouillière, of very original design, and the new central railway station of New York, *apropos* of the recent visit to Paris of Mr. Whitney Warren.

Deutsche Bauzeitung deals with village churches in reviewing the new monthly *Die Dorfkirche*, and very picturesque are some of the village churches of Germany. As a contrast our contemporary gives an illustrated article on New Synagogues, that in Posen being the text.

Architekten und Baumeister Zeitung illustrates a villa in the suburbs of Vienna, which in its pseudo-mediævalism is rather terrible, and a winter garden and porte cochère forming an addition to the Belvedere Schloss, with which they are fairly in accord.

Het Huis continues its illustrated account of the picturesque architectural features of Oud Deventer, and gives also the commencement of an article on Zaandjik.

Arkitektur og Dekorativ Kunst is chiefly occupied with the recently decided competition for a school for the blind at Dalen, near Trondhjem, but also illustrates some excellent furniture designs by Gudmund Hoel, architect.

The *Architectural Record* for November is a country and suburban house number, and gives a good purview of modern American architecture in this direction; albeit the examples are the residences of wealthy men.

The *Engineering Magazine* continues its description of the bridges of New York City, with an account of Brooklyn Bridge and Brooklyn bridges. These may be examples of clever engineering, but cannot lay claim to any superabundance of beauty.

The *Engineering Record* has an interesting article on the compressive strength of coke breeze concrete, in which are given the results of experiments made at Cornell University by Mr. H. A. Appel and Mr. John M. Lewis, under the supervision of Professor O. A. Johannesen.

COMPETITIONS.

Mitcham.—A limited competition has recently been held in connection with the proposed Baptist Church and Sunday school, to be built in the London Road, Mitcham. The committee invited six architects to submit designs, and from among these have selected the scheme submitted by Messrs. Thomson & Pomeroy, F.R.I.B.A., M.A., of 49 Hill Road, Wimbledon.

Preston. — The Preston Corporation recently organised a competition for a Boys' Grammar School, estimated to cost 12,000*l.* The designs had to be sent in by November 1. The premiums of 50*l.*, 30*l.* and 20*l.* have been awarded as follows:—1, Messrs. Woolfall & Eccles, FF.R.I.B.A., Liverpool; 2, A. J. Greenwood, Manchester; 3, Messrs. Packer, Druit & Druit, Southport.

Wellington.—The designs of Messrs. Shayler, Swan & Ridge, of Shrewsbury, have been selected, in a limited competition, for a secondary school at Wellington, Salop.

Whitchurch.—The designs of Mr. J. Holt, of Manchester, were chosen in a limited competition for a secondary school at Whitchurch, Salop.

GENERAL.

Mr. L. Rome Guthrie, architect, has changed his offices to 13 John Street, Adelphi.

The Llandrindod Wells Town Council have received the sanction of the Local Government Board for a loan of 6,000*l.* for the erection of a pavilion in the recreation ground.

The Joint Isolation Hospital Board recently constituted in the Isle of Wight has decided to erect, at a cost of some 8,000*l.*, a large permanent isolation hospital for the treatment of infectious diseases, on a site purchased near Newport.

The Local Government Board have sanctioned the borrowing of the money for the erection of the new Grammar school at Wolsingham, which will be proceeded with without delay. The cost of the new school will be about 10,750*l.*

The British Committee of the Venice International Exhibition of Fine Arts has been requested by the municipality of Venice to announce that it has been decided to hold the ninth Fine Art Exhibition at Venice in May of next year, and not in two years' time, as originally arranged, this decision having been arrived at in order that the exhibition may not clash with that to be held in Rome in 1911. At the exhibition last spring the sales of pictures in the British section were larger than those of any other country except Italy.

FORTHCOMING EVENTS.

Monday, November 29.

Royal Institute of British Architects: Business Meeting.

London Institution: Paper on "An Architectural Journey from Noyon to Rheims," by Mr. Henry Beaumont.

Tuesday, November 30.

Institution of Civil Engineers: Continuation of discussion on three papers read at the meeting on Nov. 9.

Wednesday, December 1.

Royal Archæological Institute: Paper on "The Symbolism of the Crocodile in the Middle Ages."

Monday, December 6.

Liverpool Architectural Society: Paper on "The Development of Suburban Building Estates," by Mr. C. H. B. Quennell, F.R.I.B.A.

Surveyors' Institution: Paper on "The Direct Payment of Rates," by Mr. C. P. Hall, agent to the Duke of Bedford.

WESTMINSTER ABBEY.

THE careful examination of the muniments of Westminster Abbey which has resulted in the publication some short time ago of the history by JOHN FLETE, a monk of the house from 1420 to 1465, and now in an account* of the facts recorded in the fabric rolls of the Novum Opus, the building of the nave, by the Rev. R. B. RACKHAM, has rendered possible a more correct and authoritative description† of much of the architectural history of Westminster by Mr. FRANCIS BOND, than the deductions from the fabric itself of Sir GILBERT SCOTT and Mr. MICKLETHWAITE.

The Rev. R. B. RACKHAM gives us many interesting details connected with the building of the nave of Westminster from 1376 to 1528. He tells us who were the men that found the funds and the sources from which they were derived, "the builders and architects who were original enough not to seek after originality in their work," but adhered to the lines of the design carried out for the eastern part of the church, the presbytery, choir, and transepts. We are informed of the localities from which came the stone, the marble, the timber, and the lead, the rate of progress and the vicissitudes and delays that occurred. Collecting the various sums recorded as having been spent on the building of the nave and making allowances for the years for which the accounts are missing, the cost of the work in modern values amounts to between 252,000*l.* and 315,000*l.*

As illustrative of the assistance that the examination of contemporary records has afforded to the correct historical understanding of the Abbey Church we may instance a point in which Mr. RACKHAM differs from the conclusions of Mr. MICKLETHWAITE. The latter in his diagram of the Abbey, given in FEASEY and MICKLETHWAITE's "Westminster Abbey," 1899, has marked the clerestory of bay 5 and the roof of bays 5 and 6 as "1500-1512." Mr. RACKHAM points out that Mr. MICKLETHWAITE did not know that the roofing was begun in 1469 and finished in 1479, with the exception of a portion at the west end, and that the stone vaulting was put up quite independently of the roofing and after the roof had been completed. Hence the clerestory walls of bay 5 must have been finished before 1479.

Mr. RACKHAM disagrees with the view held by Mr. BOND that Abbot ESTENEY began his vaulting of the nave at the west end, although admitting that this theory clears away the difficulty of the Tudor badges and would agree with the testimony of JOHN FELIX, a monk of Westminster from 1525 to 1537. Although allowing the possibility of Mr. BOND's view being correct, Mr. RACKHAM adheres to his own conclusion that ESTENEY began with bay 7 and worked westwards. Thus even the work that has been so well done in the investigation of the fabric rolls of the Novum Opus does not completely solve all the problems connected with the building of Westminster Abbey, but it adds very largely to our knowledge and to the data from which correct deductions may be made in many directions.

Mr. BOND's monograph of Westminster Abbey not only deals with the history of the Coronation Church of England which JOHN FLETE described as "Caput Angliæ diademaque regni," but is intended to illustrate the meaning of a monastic or collegiate church, and the standpoint of those who devised its form and of those who contributed to its magnificence. As the author emphatically explains, such churches as Westminster were not built for the purposes of a congregation, for the use of man, but for the glory of GOD and the Saints; hence the planning is not arranged to suit the convenient accommodation of a large body of people, but for worship by small numbers at frequent intervals—in fact, practically continuous day by day, month by month, and year by year.

In his elucidation of the plan of Westminster, Mr. BOND cleverly explains in popular terms the use of the church (1) by the monks, (2) by pilgrims, (3) by the general public, (4) by Royalty, (5) by the King's Treasurer, and extols the excellence of the arrangements made and provided for the several functions that the building was intended to fulfil. In his explanation of the plan the author shows how this was modified from time to time, starting with the Norman Church of EDWARD THE CONFESSOR. With regard to this we quite agree with the suggested plan as Mr. BOND presents it, both because it closely follows the practically universal type of Romanesque apsidal churches prior to the full development of the chevet, and because we cannot understand the meaning of *subter et supra* in the passage quoted otherwise than as referring to chapels projecting both from the transepts *subter* and from the apse *supra* of the *principalis aræ domus*.

When we come to Mr. BOND's chapter on "Principles of Design" as exemplified at Westminster, we cannot say that beyond some pretty writing he has at all made out his case that the measurements of 511 feet long, 100 feet high, and 35 feet broad, and no other, were the most suitable dimensions for Westminster. Especially is it trifling with common-sense to assert that the accom-

* *The Nave of Westminster.* By the Rev. R. B. Rackham, M.A., of the Community of the Resurrection, communicated by the Dean of Westminster to the British Academy. (London: Henry Frowde. 5*s.* net.)

† *Westminster Abbey.* By Francis Bond, M.A., F.G.S., H.A.R.I.B.A. (London: Henry Frowde. 10*s.* net.)

Digitized by Google

modation required "could not be compressed into less than 511 feet" of length, or that "to make the church a single foot longer would have meant unnecessary expense and waste." In this we think Mr. BOND has allowed his justifiable enthusiasm for the beauty of Westminster to run away with his judgment. He is on far more solid ground when he explains the simple and admirable proportioning of nave arcade, triforium, and clerestory.

Few will be inclined to agree with the conclusion at which our author arrives that the Church of Westminster was designed by a French architect whose name is unknown, and carried out by English architects, HENRY of Westminster, JOHN of Gloucester, and ROBERT of Beverley. Our author should not be too dogmatic on the point, for in the time of HENRY III., Westminster, both court and monastery, was French to the core. Neither English nor Latin were allowed to be spoken, but French only, and HENRY of Westminster must have been quite as French as the monks of the cloister. It is not impossible, then, that in setting out the lines of the church HENRY of Westminster may have been the architect who designed Westminster in accord with French fashion. Certainly we think Mr. BOND is again carried too far by his enthusiasm when he says, "No English architect, whether he went to France on a short or on a lengthened visit to study French Gothic on the spot, could have designed Westminster." It cannot be maintained that an English architect, impregnated with French sympathies, could in the thirteenth century be less capable than in the nineteenth, the eighteenth or the seventeenth, of adapting the feeling and principles of an alien method of design.

In his account of the building of the nave of Westminster, the work of the fourteenth and fifteenth centuries, Mr. BOND follows very closely the history as gathered by Mr. RACKHAM from the office rolls of the Novum Opus, though, as we have already noted, he does not necessarily or always agree with the deductions drawn therefrom.

The building of HENRY VII.'s Chapel is the occasion of much enthusiastic laudation from our author, albeit he points out how far from its founder's original desire the execution of the scheme departed. In all this, whilst ostensibly teaching the purport and meaning of architecture, Mr. BOND is writing for the Philistine, for whom his book is clearly primarily intended. Hence the explanation of the inclusion of a Visitors' Guide as a large part of the volume on Westminster Abbey. Admirably written and containing a wealth of historic information, Mr. BOND'S latest work is rather one for the layman than for the professional student, and it is therefore regrettable that the author should have made dogmatic assertions on matters of opinion in which few serious students of architecture would be ready to agree with him.

NOTES AND COMMENTS.

THE important meeting of auctioneers, estate agents, and surveyors held on Thursday in last week at the Cannon Street Hotel, London, should be sufficient to convince any fair-minded person, and even an out-and-out supporter of the present Government, that the land taxation clauses of the Finance Bill are not only dangerous in principle, but unworkable in practice. The meeting was absolutely non-political, as every one practising as an auctioneer, estate agent, and surveyor in and around London had been invited to attend. It was also a meeting of those who knew what they were talking about, who were better fitted than any other body of men to comprehend what would be the effect of the land taxation clauses if they were carried, and what were the difficulties, one might say almost the impossibilities, of correctly arriving at the valuations that the Chancellor of the Exchequer's proposals involved.

THE resolution of protest against the land clauses affirmed that in the opinion of that representative meeting of the professional men of this country who know most about land and land values, "that if the land clauses of the Finance Bill become law the result will be disastrous to the nation, as the effect will inevitably be permanently to destroy all confidence in what has been hitherto rightly considered the premier security for investment of capital; values cannot fail to be very considerably depreciated; owners and mortgagees of properties will suffer heavy losses on realisation; development of land for building will be seriously interfered with, and to a great extent stopped; and capital which has hitherto been invested in land and house property and in mortgages, by means of which building operations have been financed, and large numbers of people have been assisted in purchasing properties, will be withdrawn and sent out of the country."

AMONGST the defects of the land clauses pointed out at this great gathering of experts were that the taxation proposed is a serious inroad on the capital of the country; that there is no monopoly in land, but at the present time there are thousands of acres wanting purchasers; that land and land values are not to-day the property of the rich, but of the thrifty poor man; that the cost of valuations required by the Bill, which the Government estimated at two millions sterling, could not be carried out for anything like that amount; that there is absolutely no basis for the estimation of site value apart from the buildings and other improvements placed upon the land, and above all, that whilst inflicting serious damage and creating widespread distrust the proposed taxes were utterly useless for revenue.

To architects and to architecture the injury to the building trade and to the employment of capital in building that has already resulted from even the proposals of the Finance Bill, and that must be still more intense if the Bill were passed, is sufficient to condemn the attack on landed property that is the real object of the proposed land taxation and valuation.

THE House of Lords in its judicial capacity has given an important decision in allowing the appeal in a Scotch action of the North British Railway Company against the Budhill Coal and Sandstone Company and others, whereby it is laid down that building stone is not included in "the mines of coal, ironstone, slate, or other minerals" which by the Railways Clauses Consolidation (Scotland) Act, 1845, as by the English Railways Clauses Act, a railway company is not bound to purchase with the land required for their purposes. That is, freestone or other building stone, being the ordinary rock of the district, is not a "mineral."

THE past season's work at the excavations of Old Sarum has been principally occupied with the removal of fallen masonry and rubbish from the inner bailey, hence not many objects of interest have been as yet discovered, though there are a number of architectural fragments that give information as to the character and date of the great tower, "the tower above the postern," referred to in a Literate Roll of 1246. Some Roman as well as mediæval bric-à-brac, indicates the possibility that earlier antiquities than the Norman period may later on be brought to light.

AN agreement of useful character between quantity surveyors and master slaters and tilers is recorded in "The Standard System of Measurement of Slating and Roof Tiling" adopted by the Quantity Surveyors' Association, and the "Customary Rules of Measurement" issued by the London Association of Slate Merchants and Master Slaters. Difficulties have sometimes arisen in recent years owing to the different methods of measurement in use for cuttings and other extras on slating and tiling. These have now been brought into line by the simple plan of lineal measurement by quantity

Digitized by Google

surveyors, and an agreement as to how much superficial area should be recognised by the master slaters as intended to be conveyed by the lineal measurements. Thus the old practice of adding an allowance to the superficial area of slating by quantity surveyors will be abandoned, whilst the master slaters will still be able to charge their customers by superficial measurement.

THE grievance of the "Trafford Park Estates, Ltd.," a company trading in land, at the injury they would suffer by the land clauses of the Finance Bill has been formulated in an appeal to the House of Lords, and is an illustration of the hardship which would be inflicted not only upon this company, but upon many other owners who have bought land on which an increment has arisen prior to the purchase by the present holders.

THE Board of Education has agreed to modify the arrangement of the paper in Perspective in the Board's Art Examinations by dividing into two the section of the examination which contained questions involving the use of instruments and requiring accurate measurements for their solution, so that candidates may select an easy question if they aim at no more than a "second class" success, but must take one of the normal difficulty if they aspire to the Art Class Teacher's Certificate. The section of the examination dealing with what we may call the freehand application of perspective remains unaltered.

WE note that in the course of his Hermione lectures at Alexandra College, Dublin, Sir WILLIAM RICHMOND, in speaking of Greek sculpture and the work of PHEIDIAS, drew attention to the fact that amongst the Greeks the cold colour of marble was felt to be unsatisfactory, and that the chryselephantine statue of ATHENA was but one example of the general use of colour upon statues, of which the eyebrows, eyes, and borders of garments were painted, the lips touched with red, and even upon the cheeks was implanted the flush of health. But, said Sir WILLIAM, there was in this colouring nothing offensively life-like; on the contrary, instead of realistic representation, the treatment was no more than a suggestion of life made with taste and skill. How this colour was applied was largely a matter of conjecture: probably it was done with wax. The colour sense of the Greeks was very likely derived from the Persians. It cannot, we think, be too often repeated that in the best periods of both sculpture and architecture—Egyptian, Greek, Roman, Mediæval, and Renaissance—colour was always an accompaniment of form. The idea of pure white marble or stone as the most fitting means of expression for architect or sculptor was a heresy that was unknown before the eighteenth century, and even so was not generally accepted until the nineteenth century.

Is it worth while to win a competition for the post of architect to a municipal building? Judging from the experience of Messrs. SILCOCK & REAY with the Cornwall County Council offices one would say not. After many months of delay and interviews with committees, some of them apparently, from what was said at the last quarterly meeting of the Council, not very pleasant for the architects, it has been decided that tenders may be obtained on the understanding that they shall not exceed 15,000*l.* including the Council Chamber. How very pleasant to win a competition with about the cheapest design submitted, and then spend months in fighting to prevent it being utterly ruined by what is probably foolish cheese-paring. The great economist of the Council expressed his desire at the quarterly meeting to knock out the portico. Evidently the Cornwall County Council want their office building to be a work-house and to look as much like one as possible.

ESSENTIALS IN ART.

AT the Dowdeswell Galleries in New Bond Street, W., there has been on exhibition since the commencement of the month, and will continue open until December, a collection of pictures, church and domestic decoration, &c., by Mr. Reginald Hallward. The reception offered to them by the critics of the London and provincial papers has been marked by the greatest diversity. Their originality—to use a mild phrase—could not possibly meet with unanimous acceptance, for anything that is a departure from time-honoured principles always arouses instinctive distrust and scepticism. Some critics regarded the exhibition as the work of an earnest apostle of a new gospel, while others looked upon it as the spurious product of a trickster and poseur. Mr. Hallward was moved to attempt to justify his aims and incidentally to protest against the cant and superficial knowledge that he considered passed for competent criticism. It is always refreshing to listen to a man with strongly individual and rational views. Hence, when it was announced that Mr. Hallward would lecture on "Essentials in Art" at the Gallery on Thursday of last week, it was not surprising to find that the room was well filled. But many must have gone away disappointed if they came expecting to hear an attack on newspapers and their critics, for Mr. Hallward in his first words explained that his intention was not to deal with the essentials in his own art, but with the principles of art as old as the Egyptian and Greek sculptures. Such a subject could scarcely be treated in the pure abstract under such personal circumstances, and, as a matter of fact, there is a strong personal, though not egotistical, note throughout the lecture.

One of the difficulties that beset the artist is, he said, the necessity he is under to create the means of his own expression. Despite the conflicting views of different schools, he is more likely to be condemned than praised for not adopting one or other of the modes in vogue. The public bring all their prepossessions to assail the unfortunate artist who, having his own special vision of beauty, has to create his own self-expression. Those who preach the prevailing theories about art seek to interpret it in a narrow way and to exclude all that does not answer to a very shallow and partial interpretation. Above all they promulgate that formula which dates the birth of painting from Velasquez, thereby confusing the issues of art and detaching it from life. They treat art as an exotic for the rich and the cultured and having its roots in vice. Whereas to others art is rather the flower of a nation's life springing from the nobility and happiness of a people. Such theories only consider those directions of art which are purely external and naturalistic.

Mr. Hallward described its axiom—"truth to nature"—as being no less nauseous than "art for art's sake." A moment's attention and comparison of a work of great art like Gainsborough's "The Watering Place," or "The Virgin of the Rocks," by Leonardo da Vinci, with nature will, he asserted, explode their theory that art is only imitative and not creative. Goethe wrote that the artist has to raise nature to his own conceptions—meaning that it is the idea penetrating the form that gives value to art. The theory of art for art's sake, which would detach it from any intention or idea, is contradicted by the "Sower," a picture by Jean François Millet, in which is heard almost the very voice of religion itself.

The nation has been led too long, declared Mr. Hallward, by those who interpret the arts not as they minister to the well-being of life, but as they minister to selfish ambition, pride, and exclusiveness. One leading critic wrote that what was now desirable was "not vastness and strength and iron durability, but lightness, swiftness, delicacy, and a ready and sensitive response to the slightest currents of feeling," and that the right vehicle of the age was not fresco but water-colour. This philosophy is no more true than the statement that the arts are dependent on mere trading and fashion and whims.

The effect of all these doctrines has been to enormously increase the difficulties of artists who do not conform to them and whose object is the love of beauty and desire for its expression, whose desire is to transmit their feelings and ideas through the vehicle of form and colour. People are only now beginning to free themselves from these widely-disseminated heresies. The moment they understand that art is not nature, but the interpretation of nature (a language totally different to the "truth to nature" theory), they will find it interpreting their own lives and giving satisfaction and happiness. The essential quality of art is that it is the vehicle of moods, ideas and feelings which dominate and guide the form—which is not nature, but nature interpreted through the language

Digitized by Google

of art. The greatest philosophers unite in declaring it is the idea behind it which is the force in a work of art.

Mr. Hallward, in applying these principles to the State encouragement of art, said it is evident that as the only source of art is the artist himself, the best evidence of true encouragement is the occupation of the best artists and craftsmen in the widest use of their powers. Yet what employment was offered to Blake (who lived on 10*s.* a week), Rossetti, Alfred Stephens (who ended his life with a pistol-shot), Maddox Brown, Watts, and others in their lifetime by the State? Almost none. The money is devoted not to the help of men of genius, but in the creation of art-masters and the enlistment of more and more students. Surely there is a grave defect in a system which leaves the artist out. The only encouragement offered to them is to cease to be artists by selling their birthright for lucrative official posts and thereby to escape the cares, toils, and privations which beset the artist of independence. The volcanic force of the arts is in struggle and aspiration, in independence from power. The State-endowed artist, with all the advantages of his official position, influence, and income, competes with his brothers who are confronted with hardships and struggles, and finally he loses sight of the sources of strength and comes to hate independence.

The art school stereotypes craft. Professor Lethaby, its leading spirit, in a recent interview, stated, "What we mean by art needs to be explained as quality of workmanship." But this, said Mr. Hallward, is not art at all; it is purely craft. Plato said that art was a low thing unless attached to the idea, and it is that low thing that is being fostered throughout the country at the cost of art. Craft of all kinds is easily learnt. Raise it to art and express something through these crafts, and only then do the mighty difficulties begin. So long as one kind of technical proficiency is made the test the public will look for the wrong thing and encourage the bad. Happily an uncertainty is gathering in the public mind as to the reasonableness of continuing to subsidise more officials and to extend a system so ill-informed as to the nature of art. Professor Lethaby has spoken of the desirability of a Conference; what is needed, in Mr. Hallward's opinion, is a Commission to inquire into the working of the whole system and to effect those reforms which are so urgently needed.

Mr. Hallward, in summing-up what he had said as to essentials in art, affirmed the following points:—

1. That art is a language through which the artist transmits feelings and ideas which he has experienced. It is emotion realised in form. Or, as a great writer has said, "Art is a human activity consisting in this, that one man consciously, by means of external signs, hands on to others feelings he has lived through, and that other people are infected by these feelings and also experience them."

2. That therefore the "art for art's sake," or any other partial theory which robs art of this extreme value to life, is false altogether.

3. That a system of art education carried on by public funds which makes the craft standard, and only one aspect of that, the source of art is wholly opposed to its welfare.

4. That as a result of this the public mind is hopelessly confused as to the real purpose and nature of art and its importance to life.

5. That as a direct consequence of this the life of the creative artist having to find his own interpretation is largely a martyrdom, harder than it ever was before.

6. That a Commission is urgently needed to inquire into the whole system, which Commission should be fully representative of unofficial artistic opinion.

THE ARCHITECTURAL ASSOCIATION.

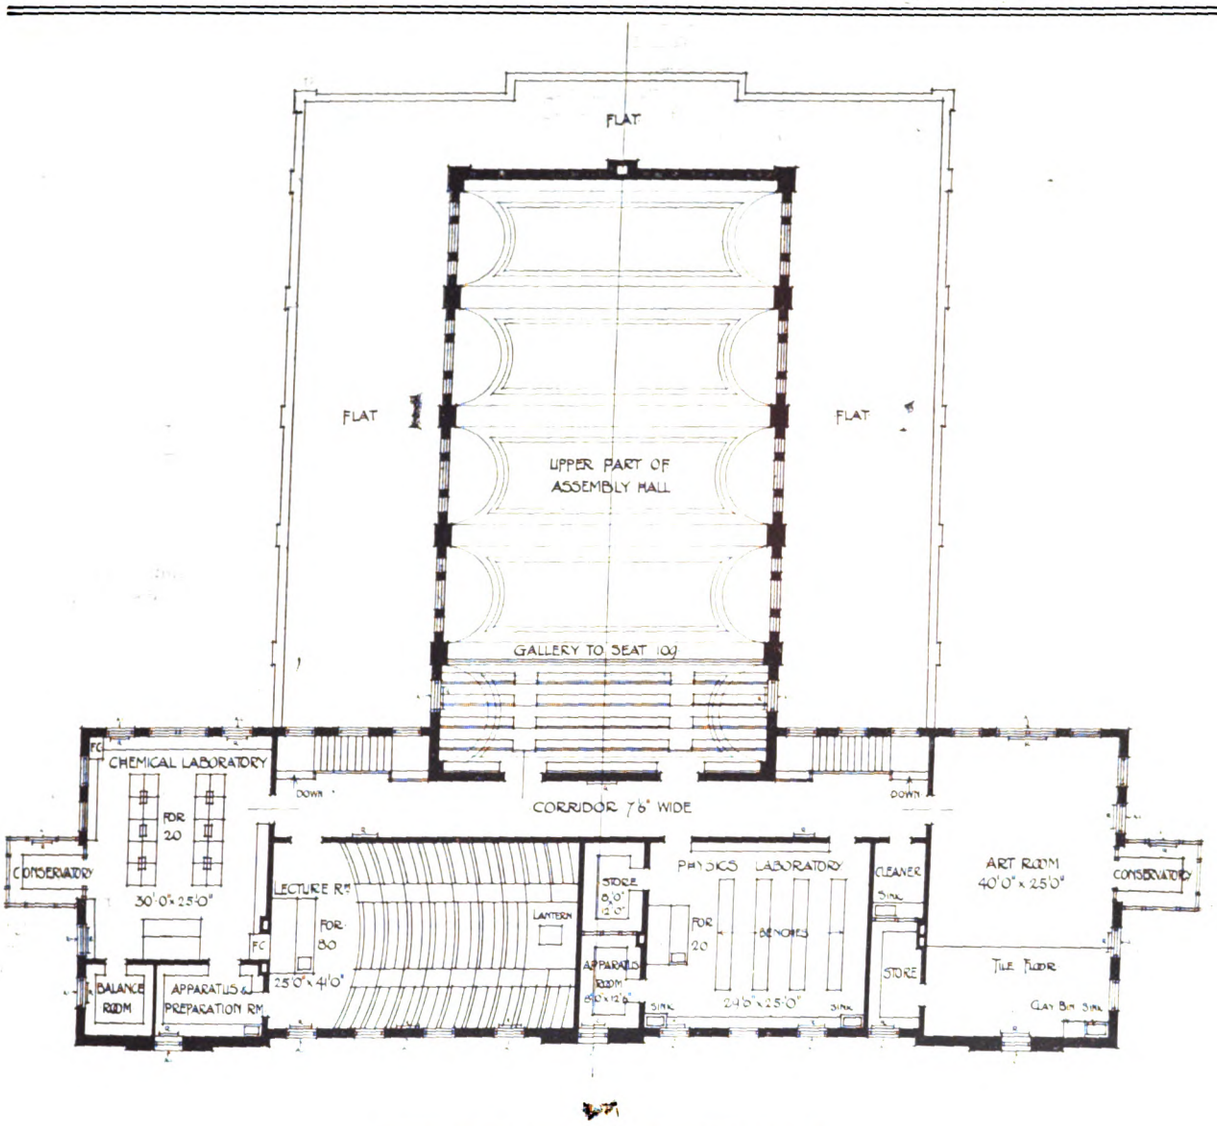
A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. H. Tanner, F.R.I.B.A. (president), in the chair.

The following gentlemen were elected members:—Messrs. W. B. Stedman, R. G. Hopcraft and W. Paramor.

Mr. C. Reginald Enock read a paper, illustrated by lantern views, entitled:—

The Architecture of the Incas of Peru.

A study of the architecture of the Incas of Peru, he said, takes us back into the interesting—almost fascinating—past of what we now call the "New" World. Upon the plateaux and slopes of the great snow-crowned Cordillera of the Andes, fronting upon the boundless Pacific Ocean, towards the setting sun, we encounter a series of ancient buildings and stone structures so remarkable as can only be compared with those of the Nile; to which, indeed, they have a certain analogy, as we shall see.



First of all, let us briefly consider—and it is necessary to a proper understanding of the subject—the topographical conditions surrounding the old Empire of the Incas. As we approach Peru from the sea we are confronted with a long, sterile shore, beaten by tearing surf between the few havens. There is no sign of life upon the seaboard, except the cry of the seals and the occasional flights of guano-producing seabirds, which fly at times in veritable clouds upon the face of the water. As for man and his habitations, except for the few seaports and the streets and houses clustered around them, and the irrigated plantations in the vicinity of the few rivers which descend from the Andes to the sea, across the 80 to 100 mile wide strip of coast lands, there is nothing to be seen. The coast lands are mainly sunbeat deserts, which for hundreds of miles separate the valleys where agriculture is possible under irrigation. For the coast-zone of Peru, lying between the foot of the Andes and the Pacific Ocean, is a rainless region—rain never falls there—1,400 miles long, extending southwards into the appalling deserts of Tarapaca, in Chile. Nevertheless, it is upon this coast-zone, which enjoys a generally excellent climate in other respects, that the Spanish-American peoples have mainly taken root; and Lima, the handsome capital of the Republic of Peru, is situated thereon, a short distance inland, as well as other cities.

Crossing this dry coast-zone we rapidly ascend the Andes, and encounter climatic conditions exactly the reverse of those we have left below. Heavy rainfall and snowfall, bracing and rarefied air, and perpetual snow upon the summits are the characteristics of this lofty region, the roof of the South American world. Topographically this region consists of great, high, bleak plateaux, from 10,000 feet to 16,000 feet above sea-level, absolutely treeless; and to reach these from the coast or from the interior, or indeed from each other, we have to cross the intervening ranges of the Andine Mountain system; vast parallel ranges whose passes are rarely less than 14,000 feet above sea level, and whose summits rise in some cases to more than 20,000 feet elevation, far above the line of perpetual snow. I have crossed these inclement plateaux, passes, and summits on many occasions, and retain strong recollections of toilsome yet pleasurable days and months spent on mule-back amid their alternating sunshine, rain, and snow. Some of the snowy passes and peaks, indeed, which I crossed or ascended on foot over the perpetual snow-cap had never been trodden previously by the foot of a white man, nor, indeed, of any human being. The mountain sculpture of the Andes is beautiful and striking; the rising or setting sun tinges the snow-crowned peaks with that ruby glow known only to the Andine or Alpine traveller, and the vast heavenward-pointing ridges of upturned strata of the Silurian or Cretaceous period, and the great uplifts of plutonic rocks form mighty façades and far-reaching Andine towers and aisles—an eternal architecture which surmounts the work of man's hands that lies below, and perhaps has influenced its character.

I have dwelt thus upon the climate and topography of Peru because it bears in an important way upon the architecture of the Incas and pre-Incas who flourished there in past ages. The mural remains of these people, their great monuments in stone and sun-dried brick are found all over the region of the Cordillera, and to a lesser extent upon the coast; and their character varies much in accordance with their situation and climatic environment. Thus upon the rainless coast-zone the buildings were largely of adobe, or sun-dried earthen bricks; the well-known material used throughout Spanish-America to-day, whether in Mexico, Peru, or Chile; whilst as we rise to the rainy region of the mountains we observe that they are of stone, shapen or unshapen. The adobe lasts for centuries on the dry coast plains; it would have perished long ago upon the rainy plateaux and become obliterated; and here it is that the beautiful examples of the stone-shaping art of these pre-Hispanic people is found in its perfection. The whole region over which these monuments are found may be taken as more than 1,500 miles long by 300 miles wide, extending throughout what is now Ecuador, Peru, Bolivia, and part of Chile—an enormous range of territory for a semi-civilised people to influence, and greater than that which included the civilisation of the Euphrates and the Nile together.

The Inca Empire, it will be recollected, flourished as far as can be ascertained from the time of the first Inca, Manco Capac, who founded the dynasty at the beginning of the eleventh century of our era, to the time of the arrival of Pizarro and the overthrow of Atahualpa, in 1532. But the Incas were not the first civilised people of Peru. They were preceded by, and probably inherited their civilisation from, the Aymaras, whom they probably overthrew. The various

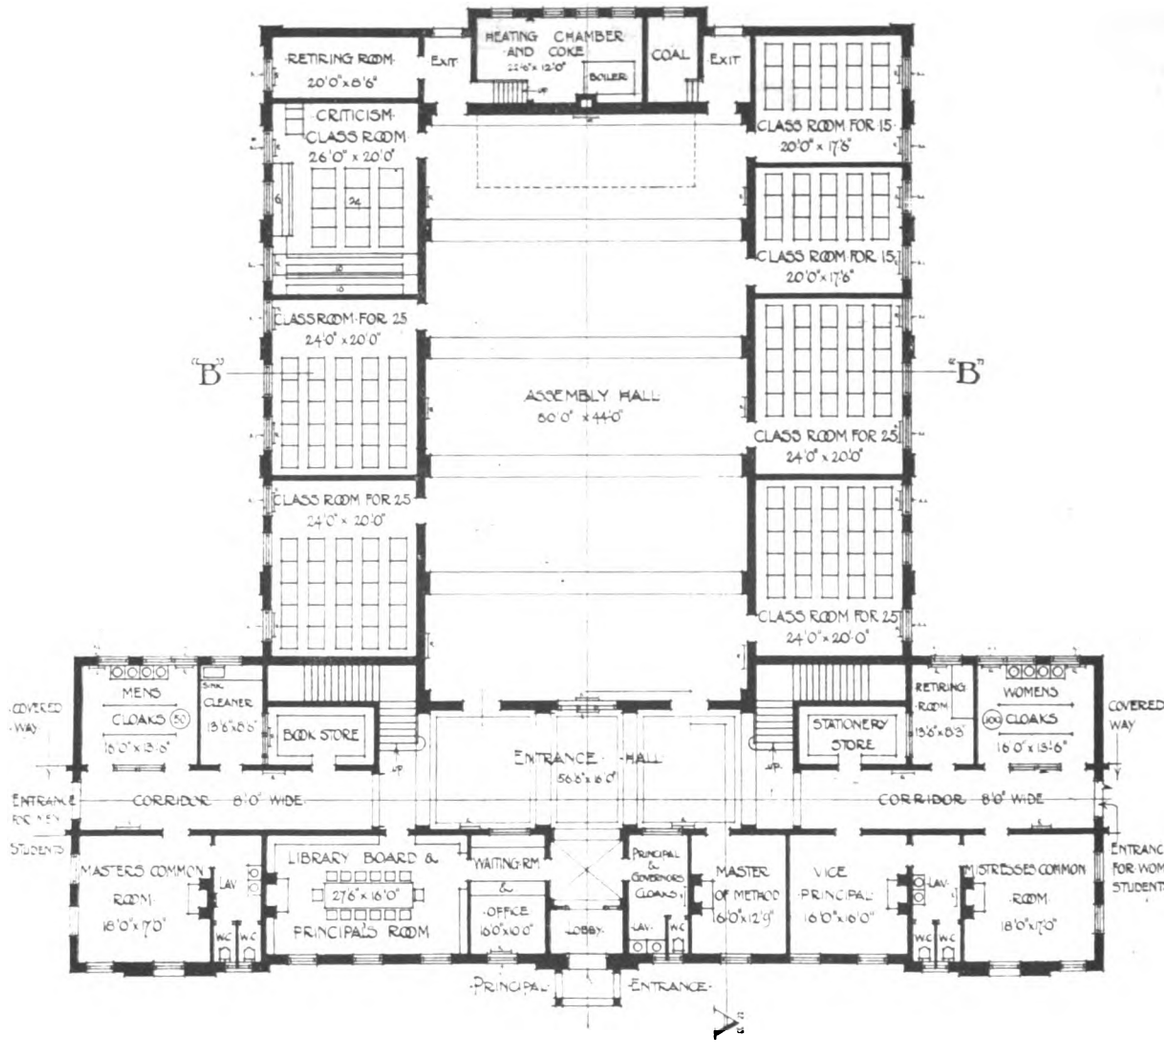
mural remains throughout the country are, therefore, of different people and periods—some only nine to five hundred years old, others being of much more remote epochs, measured possibly by thousands of years.



The Empire of the Incas, at the time of the conquest of Peru in 1532, had as its main centre Cuzco—the word itself signifies "the navel"—in modern Peru, and Quito, the capital of Ecuador, upon the equator; and these centres were connected by the famous Inca roads, which some historians—generally those who have not seen them—have described as equal to the roads of the Romans, which statement is far from being true. They were, however, means of communication of the utmost value to the Empire, and although they were nothing more than trails for the llamas, those wonderful camels of the Andes which were the only beasts of burden known to the people, who consequently possessed neither horses nor wheeled vehicles, they gave access from place to place, and were traversed by the remarkable system of posts and postmen maintained by the Inca Government. These roads, from Cuzco to Quito, were more than 1,100 miles long—a distance greater than that from the Euphrates to the Nile. Moreover, as engineering structures even, these roads were of considerable merit, crossing by rock-hewn steps the summits of the Andes above the perpetual snow-line, passing swampy lands by stone causeways, and rivers by means of the remarkable suspension bridges made of woven grass or osiers, and by stone structures.

There were two main roads. They both traversed the country longitudinally along the line of least resistance paralleling the ranges of the Andes. One, the most remarkable, ran along the high plateaux and summits of the Andes; the other followed the lowlands of the coast. The groups of buildings which we are to consider are in some cases disposed along the line of these roads, or are adjacent thereto, portions of the roads only remaining here and there. The structures consist mainly of castles and fortresses, temples, palaces, astronomical observatories, tombs, and groups of habitations or towns. All of these are now abandoned and in ruins, with the exception of some which form part of recent Spanish-American structures at Cuzco. In passing, it may be said that the Moorish type of building inherited from Spain looks exceedingly incongruous and evanescent in comparison with the solid massive Inca masonry beneath it, in the few instances where the two are encountered together.

To describe first the ruins of most notable occurrence. These are situated in the neighbourhood of Cuzco, and upon the region bordering upon the great Lake Titicaca. This lake, it will be recallected, is of its kind the most remarkable in the world, being 12,350 feet above sea-level, and so large that we may navigate upon it out of sight of land. It is remarkable also in being, in company with some other lakes, a hydrographic entity which has no outlet or means of exhaustion for its waters except that of evaporation, as far as is known.

Cuzco is about 200 miles from the lake, and was the great Mecca of the people and the seat of government. Overlooking the city—which to-day is an important, populous place, standing 11,000 feet above sea-level—is what is perhaps the most remarkable prehistoric building in the New World, and indeed in some respects in the whole world. This is the fortress of Sacsaihuaman. It consists of a series of four or more great walls, from 12 feet to 25 feet high, forming terraces up the hillside 1,800 feet long. The walls are built as great revetments, with twenty salients at regular intervals, the

WILLIAM H. THORP, F.R.I.B.A., Architect.

masonry being formed of Cyclopean worked stones, which in some cases are nearly 20 feet high, weighing many tons. Indeed, we are at once struck on observing the walls of this fortress, as well as those of others of the Inca buildings, with the remarkable character of the masonry, not so much by the size of the monoliths as by what is either a singular disregard of uniformity and alignment in the joints, or is a curious, purposeful variation of these. Thus we see that each stone is an individual, not a counterpart; a polygon, not a cube. In many cases the stones are cut out to fit each other in a way such as must have involved much labour, especially when it is recollected that the Inca masons probably had no means of laying out angles; so that presumably the stones were made to fit each other by the laborious method of constantly removing and replacing. It has occurred to me, although I may be wrong, that this giving of an individuality of form to each stone was a nice and purposeful art, or carried out for some now unknown reason. Notwithstanding this diversity of surface, the contact between the stones is generally so perfect that a knife-blade cannot be inserted; and there is no mortar. In some of the temples—it is stated by the Inca historian, Garcilaso—gold and silver was used as a bedding material for the stones. Whatever may have been the reason for this lack of uniformity in the Inca masonry, it is singularly beautiful and unique, and the walls have well resisted the ravages of time and the elements. In the streets of Cuzco some well-preserved examples of Inca walls form part of modern buildings, as before mentioned. A good example is the wall which was the base of the Palace of Huayna Capac, one of the later Inca emperors. Here massive stones are encountered, polygonal in form, fitting perfectly into each other. One of these, it may be observed, is a twelve-sided polygon. This wall forms part of an Inca street which is used to-day. In the city of Cuzco there are various other buildings, notably the remains of what was the Temple of the Sun. Overlooking the valley we have also the singular steps or terraces, cut out of the living rock, which is termed "the seat of the Inca," and it is stated that the Inca emperor took his seat here to watch the construction of the great fortress.

At about a day's ride from Cuzco we reach the head of the Yucay Valley and see its base 4,000 feet below. Upon the slope of this remarkable valley—it is one of those which drain into the affluents of the Amazon—the ruins of another remarkable fortress are encountered—that of Ollantaytambo. This also consists of great terraces of Cyclopean masonry. In this structure a common feature of Inca architecture—the series of niches in the walls with their characteristic trapezoidal form—give a unique and handsome effect. No style of building could accord so well with its environment as these massive structures of the Incas. Possibly the builders were influenced by the mighty mountains which overhang their valleys, as I have before averred, and strove to adapt their work to the stupendous Andine architecture on every hand, fashioned by the "Unknown God" to whom their temples were raised.

Another remarkable group of ruins in the same region is that of Intihuatana and Pisac. The latter is another imposing fortress upon the summit of the mountains, a remarkable situation with an extensive view of the surrounding cañons. But this fortress of Pisac had its own sacred purpose. It enclosed—and still encloses—the temple wherein stands the famous astronomical stone or pillar of Intihuatana.

BLOCK PLAN OF SECOND PREMIATED DESIGN FOR TRAINING COLLEGE, HULL.
By WILLIAM H. THORP, F.R.I.B.A., Architect.

This word means in the Quechua tongue, "the seat or throne of the sun," or the place "where the sun's rays are collected." The pillar was, in fact, the instrument by which the Inca astronomer-priests determined the solstices. The column, now broken but still existing, is worked out of the solid rock. It is enclosed by a circular tower, and in this the priests observed the shadow of the column upon an east and west line inscribed upon a circle which surrounded it. When the day approached great feasts were celebrated, and a golden stool was placed upon the shaft so that "Inti," the sun, might "sit down" upon it for the solstice. There were others of these astronomical pillars throughout Peru and Ecuador, but they were generally destroyed by the Spanish priests after the conquest, as "things of the devil." The fortress and buildings surrounding the column-chamber are beautifully executed—stone-built corridors, halls, and chambers; whilst the whole place, surrounded by beetling precipices and protected by revetments of granite masonry, is impregnable. In the rock walls of the valley are seen ancient tombs in absolutely inaccessible positions to-day. These great fortresses commanded the valleys leading down to the region of the Amazonian forests below, and were to protect the empire from the incursions of the savage tribes dwelling there. Even to-day the forest region beyond the Andes is a savage unexplored territory in great part, inhabited by bands of Indians, although the business of rubber gathering is opening it up to some extent.

(To be concluded.)

LIVING ARCHITECTS.—NO. 24, MR. ARTHUR C. BLOMFIELD, M.A., F.R.I.B.A.

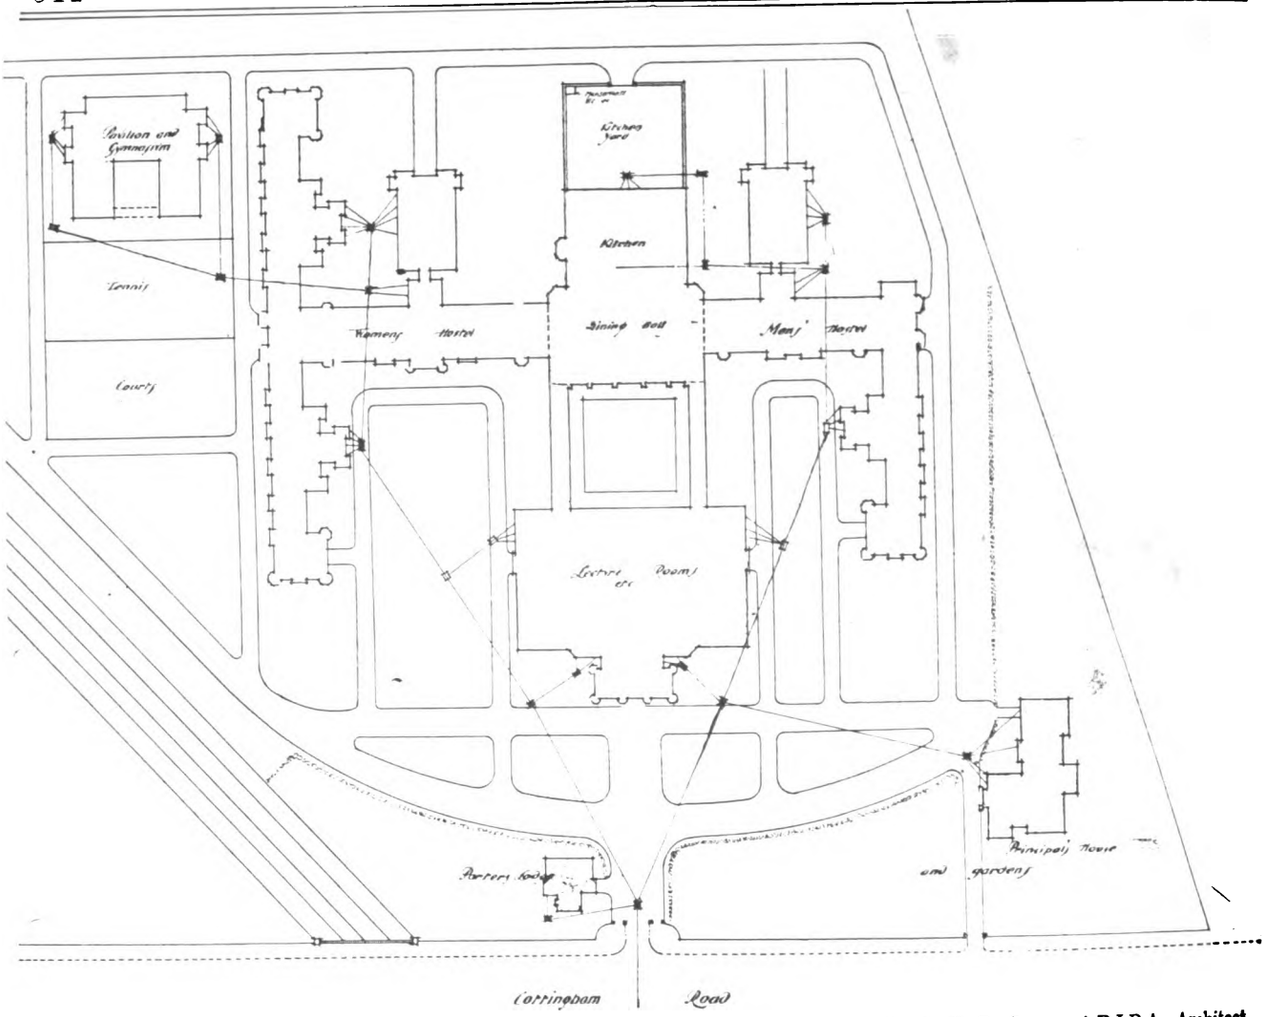
MR. ARTHUR BLOMFIELD, with his brother, Mr. CHARLES J. BLOMFIELD, not only carries on the practice founded by their father, Sir ARTHUR BLOMFIELD, but has made his mark in particular as a designer of banking premises in the City of London, which are worthily representative of English architecture at the present time.

NO. 25, MR. PAUL OGDEN, F.R.I.B.A.

MR. PAUL OGDEN is one of the prominent architects of Manchester, and has recently filled the office of President of the Manchester Society of Architects.

DESIGN FOR A CHURCH IN EAST ANGLIA.

THE drawing from which our illustration is taken was exhibited in the Royal Academy this year, and is the work of a young architect who has not yet attained his majority, Mr. WILLIAM H. COATE.



A DESIGN FOR GLAMORGAN COUNTY OFFICES.

THIS drawing also was exhibited in this year's Royal Academy, and represents Messrs. GARRATT & SIMISTER'S unsuccessful competition design for the new offices at Cardiff for the Glamorgan County Council.

NEW OFFICES FOR THE SCOTTISH UNION AND NATIONAL INSURANCE COMPANY, LEEDS.

THE building erected for the above company is constructed with KAHN'S system of reinforced concrete for the walls and floors, the former being faced with keyed terra-cotta blocks having a glazed face. These blocks are made by the Leeds Fireclay Company at their works at Burmantofts, and are known by the trade name of "Marmo." Messrs. W. NICHOLSON & SON, of Leeds, were the contractors for the whole of the works. The heating is on the cable system, and was installed by the Leeds Marble Company. The electric lift serving all floors was provided by A. & P. STEVENS, Glasgow. Mr. THEWLIS, of Leeds, modelled the terra-cotta and plaster enrichments. The insurance company occupy the ground floor, above a well-lighted basement which is let, as are all the upper floors, for offices. The architects of the building are Messrs. PERKIN & BUDMER.

BLOCK PLAN OF THIRD PREMIATED DESIGN FOR TRAINING COLLEGE, HULL. By G. H. B. GOULD, A.R.I.B.A., Architect.

NORTHERN ASSURANCE COMPANY'S OFFICES, MOORGATE STREET, E.C.

THIS new building has frontages of 76 feet to Coleman Street, to Lothbury of 104 feet, and to Moorgate Street of 80 feet. The site is freehold belonging to the trustees. The foundations are at a depth of about 29 feet below the existing pavement level. Two basements have been constructed. There is a spacious ground floor and five floors above, besides a sixth floor for the housekeeper's quarters. The elevations are designed in a bold Classic style, a large Ionic order being used above the ground floor, with columns 30 feet high supporting the main cornice. The whole of the exterior is faced with white Aberdeen granite from the Kemnay quarries, finished with a fine tooled face. Some of the blocks weighed seven tons. One of the requisitions of the freeholders was that the building should be so designed that it could be divided into three separate buildings. There are therefore three staircases—one entered from Lothbury, another from Moorgate Street, and one for the exclusive use of the Northern Assurance Company. The board room, committee rooms, luncheon room and general manager's room are situated on the fourth floor, and are panelled and finished in wainscot in the Georgian style. Electric passenger lifts (of which there are four) have been provided adjacent to each staircase by the Otis Elevator Company, Ltd. The building is fireproof throughout and of the most solid construction. The steel stanchions and girders, supplied and fixed by Messrs. LINDSAY, NEAL & Co., of Paddington, are encased with fireproof material. The floors and internal partitions are formed of frazzi. The work of erection was commenced in November 1907. The contract (amounting to over 100,000*l.*) has been carried out by Messrs. TROLLOPE & SONS and COLLS & SONS, LTD. The architects appointed to design and superintend the construction of the building were Mr. E. A. GRUNING, F.R.I.B.A., F.S.I., and Mr. E. W. MOUNTFORD, F.R.I.B.A. But both these gentlemen died during the progress of the work, Mr. MOUNTFORD on February 7, and Mr. GRUNING on December 29 of last year. On the death of Mr. MOUNTFORD his place was taken by his partner, Mr. F. DARE CLAPHAM, A.R.I.B.A.; and since the death of Mr. GRUNING, Mr. H. ALEXR. PELLY, F.R.I.B.A. (who succeeds to Mr. GRUNING's practice) continued to advise the company. Among the contractors who have not been already mentioned are The Well Fire and Foundry Co., Ltd., 33 Dover Street, W.; Rust's Vitreous Mosaic Co.; Val de Travers Asphalte Paving Co., Ltd.; The Turk System Drying Co.; Mr. J. GIBBONS; The British Challenge Glazing Co.; and the Buttermere Slate Co., of Keswick.

SECOND PREMIATED DESIGN FOR TRAINING COLLEGE, HULL.

THIS design was criticised at some length in the review of the competition for the Training College, Hull, included in our issue of November 5. We give, in the text, the plans of Mr. THORP's design for Unit C, which we considered especially excellent.

THIRD PREMIATED DESIGN FOR TRAINING COLLEGE, HULL.

THE guiding idea of this plan was that the hostels are better under the same roof as the dining-hall and kitchen so long as the departments are kept distinct and disconnected; and in this plan the dining-hall effectively separates the men's and women's hostels from each other and from the kitchens. The other main desideratum was that all corridors should be well lighted and ventilated, and with this express object it was decided to avoid the use of corridors flanked on either side with rooms, but this, of course, made the plan of a more extended character. All living and sleeping rooms receive sunlight from the south, west, or east, while the sick-rooms are lighted from the south only. The class-rooms are ranged round a lofty south-lighted assembly hall, and form a separate block nearer Cottingham Road, being reached from the main building by short covered ways. The elevations are of a Tudor character, and would have been carried out in brick and tile. The whole scheme was estimated to cost 36,207*l.* The author was Mr. G. H. B. GOULD, A.R.I.B.A.

THE OLD PALACE, RICHMOND, SURREY.—COURT AND GATEWAY

RICHMOND PALACE AND ITS FOUNDER.*

THE derivation of the names of the places we visit is frequently the cause of much learned dissertation, but Richmond is accounted for at once, and it was so named by Henry VII., whose title before he succeeded to the throne was Earl of Richmond (Yorkshire).

According to Mrs. Arthur Bell's charming little book on Richmond, there was a royal residence there, or thereabouts, long before his time, but it was called Sheen. Henry I. was there shortly before his death. Edward I. also resided there occasionally, but it was not until the time of Edward III. that it assumed much importance; he greatly enlarged and beautified the house and spent much time here with his queen. It was here he received the news of the death of his son Edward the Black Prince, and he himself died here a year later. Richard II. and his first queen stayed here, and the poet Chaucer, who also was somewhat of an architect, was employed by them to superintend some alterations to the Palace. Henry V. and his son Henry VI. both used the place as a residence from time to time. The widowed queen of Edward IV. came here after her sons were taken from her, and stayed till she was dispossessed by her son-in-law Henry VII., who, after an extensive fire, practically rebuilt the place, with great additions and improvements, and gave it its name of Richmond Palace. Henry was constantly at Richmond, and it was here that the contracts of marriage were signed between his son Arthur and Katherine of Aragon, and his daughter Margaret and James IV. of Scotland. Arthur died about a year after his marriage, and Katherine then came and lived at Richmond. She was kept in great penury, could not pay her servants' wages, and had to go short of food and clothing; only half her dowry had been paid, and the question then arose with Henry whether to give up the half he had, or get the other half. He ultimately decided she should marry his second son, and a dispensation was obtained from the Pope, and they were betrothed, much against the wish of Katherine. Henry came to Richmond in his last illness, and died there in 1509. He was succeeded by his son Henry, who shortly afterwards carried out his marriage with Katherine, he being eighteen and she twenty-four. Their first child, a son, was born at Richmond Palace, but died soon afterwards. There were other children, but none lived except the Princess Mary. Henry was only occasionally here afterwards, though a mound is shown in the grounds of Pembroke Lodge, in the Park, where tradition says he watched for the rocket which was to notify the execution of his second queen, Anne Boleyn. He was privately married to Jane Seymour immediately afterwards, and they spent their Christmas at Richmond; but she died the following year, after giving birth to the future Edward VI. The next queen, Anne of Cleves, was married and divorced very quickly; Henry had an aversion for her from the first, and a divorce was arranged on the ground of a supposed pre-contract between her and the Marquis of Lorraine when both were children. She was allowed Richmond Palace as a residence, and lived here until she was turned out by the Protector Somerset on the death of Henry VIII. The King visited her here several times, and they seem to have been very good friends, though he could not like her as a wife.

He was succeeded by his son Edward VI., who resided at Richmond for a time, and whilst here witnessed the marriage of Robert Dudley, afterwards Earl of Leicester, and Amy Robsart.

Queen Mary spent her honeymoon at Richmond, but later on had her sister, the Princess Elizabeth, kept here as a prisoner, though she afterwards received her as a visitor shortly before her own death.

Richmond Palace was a favourite place of residence with Elizabeth, and here she held Councils, received Ministers, and carried on flirtations with Leicester and other favourites. It was here she signed the death-warrant of Mary Queen of Scots, though after the execution she said her Secretary was told the warrant was not to be acted on. It was here she died in 1603.

James I. never troubled Richmond very much, but he gave it to his son, Henry Prince of Wales, who spent large sums on it. Charles I. resided here for a time, and he it was who enclosed Richmond Park, although it met with great opposition. His children were prisoners here for a time during the Commonwealth. Soon after the execution of Charles I. commissioners were sent to survey and report on the Palace, and it is from their report that we have some conception of what the Palace was like. They describe it as a very large and beautiful range of turretted buildings, including a hall 100 feet long by 40 feet broad, a chapel 96 feet long by 30 feet broad, a large library well stocked with valuable books, a beautiful gallery 100 feet long, and extensive buildings with numerous rooms, stables, &c.

* A paper read at a meeting of the Upper Norwood Atheræum by Mr. George Thatcher.

Digitized by Google

In 1650 the Palace was sold, but on the Restoration again became royal property, and was assigned as a residence to the widowed queen of Charles I.

The two sons of James II. by his first marriage died here as children, while under the charge of their governess.

After this a great deal of the Palace seems to have been pulled down from time to time, and it was not until George I. allowed his eldest son and wife to reside here that it was used by royalty again. They complained that there was not room enough for their attendants, and the houses on the Green, still called Maids of Honour Row, were built to accommodate them.

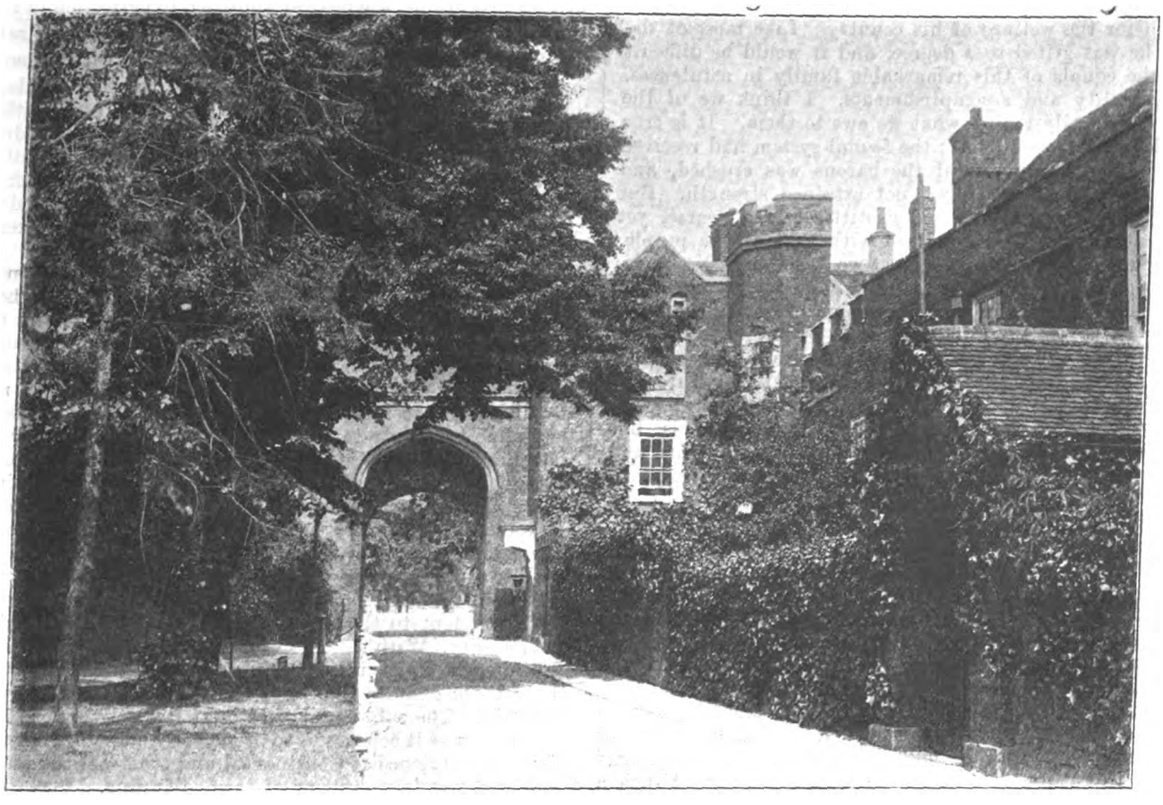
Queen Caroline, wife of George II., lived here occasionally, and it was here that Sir Walter Scott laid the scene of her memorable interview with Jeanie Deans. Since her time it has never again been inhabited by royalty.

The story of Henry VII., who may be called the founder of Richmond, reads more like a romance than mere history. His grandfather, Owen Tudor, was a handsome young Welshman, and fought in the rank and file at the battle of Agincourt. Henry V. made him one of his own squires for his bravery on that occasion. After the death of Henry, Owen was promoted to the office of Clerk of the Wardrobe to the widowed Queen Katherine, and ultimately they were secretly married. Their eldest son was Edmund Tudor, and this gentleman was created Earl of Richmond by Henry VI., his half-brother, and married Margaret Beaufort, the only child and heiress of John Beaufort, Duke of Somerset. They had one son, the future Henry VII. Henry's father died when he was only five months old, and his mother was maid, wife, mother and widow before she was fifteen. Henry's title to the throne, if indeed such a pretension can be dignified by such a term as title, is shadowy to a degree until his marriage; and to understand it, and really to understand the reason for the Wars of the Roses, we must go back to Henry III. and his sons.

Henry III. had two sons, Edward, who succeeded him, and Edmund Crouchback, Duke of Lancaster. Edward I. was succeeded by his son Edward II., and he by his son Edward III. The latter king had seven sons, the eldest being Edward the Black Prince; the second, William of Hatfield, who died in infancy; the third, Lionel, Duke of Clarence; the fourth, John of Gaunt, who by marriage with the great grand-daughter of Edmund Crouchback, son of Henry III., became Duke of Lancaster; the fifth, Edmund of Langley, Duke of York; the sixth, Thomas of Woodstock, Duke of Gloucester; and the seventh, William of Windsor.

Richard II., the only surviving son of the Black Prince, died without issue, having first been deposed by Henry Bolingbroke, afterwards Henry IV., who was the eldest son of John of Gaunt, fourth son of Edward III.; but there was then a daughter living of Lionel, the third son of Edward III., who had married Edmund Mortimer, Earl of March; but she was a widow, and although she had sons and daughters, the eldest was only seven years old, and their rights seem to have been absolutely passed over. One of her grand-daughters, however, married one of the great grandsons of Edmund Langley, Duke of York, the fifth son of Edward III., and it was through her that the Dukes of York claimed in priority to the descendants of John of Gaunt. On the other hand, to lend colour to his claim, when he caused the deposition of his second cousin, Richard, Henry IV. put about the story that Edmund Crouchback was really the eldest son of Henry III., but as he was deformed his brother Edward had been put forward as the eldest, and Henry said he was entitled to the Crown, as son of his mother, Blanche, the last lineal descendant of Edmund Crouchback.

The rival claims of these two houses involved the country in civil war for thirty years (1455-85), with varying fortune, and as this war went on it was conducted with increasing ferocity on both sides. Every success was followed by attainder and confiscation of the estates of the defeated party, and the execution of such as were taken. Many who escaped death were reduced to abject poverty; for instance, we read of Hugh Holland, Duke of Exeter, barefooted and in rags, begging in Flanders from door to door, although himself of royal descent and married to a sister of Edward IV. The Countess of Oxford supported herself and her children by her needle for fifteen years during the time her husband was imprisoned by the Yorkists. It is true that attainders were reversed and estates restored when fortunes changed, but the families of many were practically extinguished, and very few of our nobility can show an unbroken title earlier than the close of the fifteenth century.



The death of Edward IV. and his infant sons, and the usurpation of Richard III. and his tyrannical rule, brought matters to a climax, and at the instigation of the Duke of Buckingham (himself of royal descent) and Morton, then Bishop of Ely, and afterwards Archbishop of Canterbury, the wiser heads of both parties met with a view to some course which should ensure peace by uniting both; and it was decided to invite Henry, Earl of Richmond, to be king, provided he would marry the eldest daughter of Edward IV., and thus unite in their children the claims of both houses. He accepted the invitation, and landed at Milford Haven, and was met at Bosworth by Richard III. and his army. The battle was decided by the defection of the Stanleys and their retainers, who had been forced to join with Richard; at a critical moment of the battle they changed sides, and Richard was defeated and killed. Henry's life is said to have been saved by Sir William Stanley, and Richard's crown was placed by Stanley upon Henry's head.

Henry VII.'s claim was as the representative of his mother, Margaret Beaufort (who was still living at the time); she was also descended from John of Gaunt, through her ancestor John Beaufort, Earl of Somerset, who was an illegitimate son of John of Gaunt by his mistress, Catherine Swinford. It is true the children of this connection were afterwards made legitimate by Act of Parliament, but it was provided in the patent that they should be incapable of inheriting the throne. To say nothing of this obstacle, there was a large number of persons entitled to inherit before Henry. There were, in the first place, the five daughters of Edward IV.; then the descendants of Edward's brother, the Duke of Clarence; then the De la Poles, the descendants of his sister Elizabeth; then with regard to the House of Lancaster itself there were the descendants of the second marriage of John of Gaunt. Henry got over the difficulty by Act of Parliament confirming his title as king, which, however, is prudently silent as to his right to it, and he made it good for his descendants by marrying Elizabeth, the eldest daughter and heiress of Edward IV. The Pope's dispensation had to be obtained to the marriage because Henry and Elizabeth were said to be within the prohibited degrees, being third cousins once removed, their common ancestor being Thomas Holland, Earl of Kent. A strained interpretation seems to have been put on the canon which prohibited marriages within the seventh degree, and the degrees seem to have been counted by generations and not by relationship, as is now the practice in the Roman Church. The real reason for the dispensation seems to have been to obtain the Pope's official recognition of Henry's title as king, and the draft of the dispensation was sent back to Rome three times before it was so worded as to be acceptable to the king, and the marriage had been celebrated some time before it was finally settled and signed. Bacon says Henry was not an affectionate husband; at all events he was not a liberal one, for although his queen brought him a large dowry as Countess of Clare, yet her accounts show very few items for new clothes, but there are plenty for turning and mending old ones.

Almost one of the first acts of the new king was to make a recurrence of the civil war impossible. The nobles were ordered to disband their retainers, and not to maintain more than a certain retinue; and so severely was this enforced that it is related that when the king was on a visit to the Earl of Oxford a steady and consistent supporter of the House of Lancaster, he observed that he was attended by a large body of armed men, and on his departure said to him, "I thank you for your good cheer, my lord, but I may not endure to have my laws broken in my sight; my attorney must speak with you." The interview took place, and it cost the Earl 10,000*l.*, equivalent to about 100,000*l.* at the present day. While he made the barons put down their retainers, he instituted a bodyguard for himself which he called the Yeomen of the Guard, and this body is the earliest established existing corps in this country, and the only one retaining its original uniform.

In a paper such as this it is impossible to give more than a very brief sketch of the events of his reign. Two rebellions took place in support of pretenders to the throne—the first on behalf of a lad named Lambert Simnel, who was put forward as the little Duke of York supposed to have been murdered in the Tower, and afterwards as the Earl of Warwick, son of the late Duke of Clarence, who was actually a prisoner in the Tower at the time. This was suppressed, and Henry granted a free pardon to all who submitted except some of the leaders, one or two of whom he executed, and the rest he let off with heavy fines. The other rebellion

THE OLD PALACE, RICHMOND, SURREY.—WARDROBE COURT.

was of a more formidable character and occurred some years later, and lasted for more than seven years before it was suppressed. The pretender in this case was a young fellow named Perkin Warbeck, and also claimed to be the Duke of York. He very much resembled the late King Edward IV., and the probability is that he was really an illegitimate son of his; very many believed in him until his armies were finally defeated and he himself executed at Tyburn. The persons of inferior degree were again pardoned on submission, but the punishments of those of superior rank who had taken part were far more severe. Among those accused was Sir William Stanley, the king's Chamberlain. He was the brother of Henry's stepfather, had fought for the king at Bosworth, where he is said to have saved his life and placed the crown on his head. The only thing which seems to have been proved against him was that he had said if he were sure the young man were King Edward's son he would not bear arms against him. This was tortured into an expression of treason, and he was executed.

There was great doubt about the deaths of the young Princes, and it has never been satisfactorily cleared up. Henry had an inquiry made, and four persons were implicated, only two of whom were then living. The story was that Sir John Tirrell had temporary command of the Tower; that two soldiers, Dighton and Forrest, were let in, and smothered the children with pillows; that the bodies were buried by the priest of the Tower under some stairs, but that he afterwards removed them and buried them elsewhere; but he was dead, and the survivors did not know where he had put them, and the bodies could not be found.

Henry has been much blamed for the execution of Stanley, but there is no doubt that his severity in the case of such tried and proved friends as Oxford and Stanley was a strong deterrent to those who had no such claim.

In the third year of his reign Henry got an Act passed reviving and giving additional power and importance to the Court of Star Chamber. This Court can be traced as far back as the time of Edward III., or even earlier; it was really a committee of the King's Privy Council, and sat first wherever the king happened to be, but afterwards permanently at Westminster in a room with a painted ceiling representing the heavens at night-time with the stars. It professed to be instituted so that justice might be obtained by all king's subjects, which was sometimes impossible at the assizes and local courts owing to judges and juries and sheriffs being overawed by the barons and their retainers.

The Selden Society have recently issued a most interesting report of some of the Star Chamber cases, 1477-1509. The Act is 3 Henry VII., Chapter 1, an Act giving the Court of Star Chamber authority to punish divers misdemeanours. Bacon says the Court of Star Chamber (of which, by the way, he had been a member) was "one of the sagest and noblest institutions in this kingdom. The committees consisted of four kinds of persons—councillors, peers, prelates and chief judges. There were four kinds of causes—forces, frauds, crimes various of stellionate, and the inchoations or middle acts towards crimes capital or heinous not actually committed or perpetrated." It will be noticed that the mischief was that it not only dealt with crimes committed, but also with those intended or supposed to be intended, and was itself the judge whether there was an intention. Advantage was taken to make money out of this by the king, and his agents, Empson and Dudley, brought wholesale charges of treason or intended treason against all sorts of persons; capital punishment was seldom inflicted, but there were numerous and heavy fines, all of which went to the king. The sittings were nearly always in secret, and there was no jury and no appeal. From this and forfeitures on attainders the king became the most wealthy monarch of his time, and at his death his property in present money was about eighteen millions at least.

He died at Richmond on April 21, 1509, in the twenty-fourth year of his reign and the fifty-second year of his age.

Bacon's description of the king is:—"He was sad, serious and full of thoughts, full of apprehensions and suspicions, affable and fair spoken, rather studious than learned. There are no news of his pleasures. He had a comely person, a little above just stature, well and straight limbed, but slender; countenance reverend and a little like a Churchman. He had the fortune of a true Christian as well as a great king, in living exercised and in dying repentant."

His great fault seems to have been a love of money, and he descended to mean and petty tricks and deceits for the sake of it; but he was liberal to the Church and the poor, and was a great patron of the fine arts, especially architecture. He encouraged commerce and discovery, and was our first monarch to promote colonisation; he fitted out at his own cost an expedition by Sebastian Cabot, which discovered and took possession of Newfoundland, the first English colony. He was not a bloodthirsty man, and would always rather have peace than war; yet he proved himself a good and brave soldier on occasion, and tempered his successes with mercy

Digitized by Google

to the vanquished. He was one of our greatest kings, and did much for the welfare of his country. Like most of the Tudors, he was gifted to a degree, and it would be difficult to find the equals of this remarkable family in astuteness, courage, ability and accomplishments. I think we of the present day hardly realise what we owe to them. It is true they ruled almost as despots; the feudal system had received its death-blow, the power of the barons was crushed, and that of the Commons had yet not attained strength. But although they were selfish and egotistical to a degree, yet they identified their own welfare with that of the people, and recognised that the two must go together. No corresponding period of English history shows such progress as was made in their time except the reign of our late beloved Queen. In agriculture, in commerce, in manufacture, art and literature the improvement was by leaps and bounds. The country had been largely pastoral, but agriculture was widely introduced; the commerce had been mainly export of raw material and the import of manufactured goods, but now instead of exporting raw wool it was spun into yarn and woven into cloth. Linen and silk weaving were introduced, and work was found for all who chose to undertake it. Commerce led to the improvement of ships and their larger use, to the search for and discovery of new countries and to their colonisation, to the necessity of so equipping and manning vessels as to enable them to resist the attacks of pirates and hostile fleets, and it fostered the development of some of the most skilful and daring seamen the world has ever seen, so that England at the close of the time of the Tudors was queen of the seas, as she has ever since remained. The close of the wars rendered a better style of domestic architecture available, and houses were built which are still the pride of our countryside. But in nothing was the advance greater than in literature, and no age or country can show such a brilliant constellation of genius as Shakespeare, Spenser, Johnson, Sidney, Raleigh, Moore, Greville, Massinger, Marlowe and others. Printing had indeed been introduced in the previous dynasty, but had met with appreciation by only a few, and by opposition from others; it was now fostered and encouraged, and its results were soon shown in the higher education of the upper and middle classes, and the consequent softer and more refined manners. Last, but not least, it is to the Tudors that we owe our printed Bible and the beginning of civil and religious liberty.

(The illustrations are from photographs by Mr. W. S. Stuart, of Richmond.)

TOWN PLANNING SYSTEMS.

At a meeting of the Surveyors' Institution on Monday evening last Mr. A. R. Stenning (President) in the chair, Mr. W. R. Davidge read a paper, illustrated by lantern views and plans, on "Town Planning Systems."

Town planning, he said, although so much in the air at present, is no new thing. It cannot claim to be an invention of the twentieth century or to be a new and startling discovery of the present generation, nor is it even due to the abilities of our immediate forerunners. Town planning has been practised, whether under that name or not, for many centuries. Opportunities of constructing a complete town at once, or from a fixed plan, have, however, been comparatively few, and even those opportunities have not, perhaps, always been utilised to the fullest extent.

In the older cities of the world an occasional disastrous conflagration, or the destruction of a portion of the city at the hands of friends or foes, has sometimes prepared the way for a grand and general scheme of reconstruction, and many perhaps of the greatest and most famed of the cities of Europe owe their present magnificence in no small degree to the extent of their past calamities. London owes something to the Great Fire, and might have owed much more had the rebuilding been carried out in the way Wren and others would have had it. It is instructive even now to compare the schemes proposed by John Evelyn and Sir Christopher Wren for the rebuilding of London. Vienna, Paris and Berlin are all indebted to the sacrifices and often to the sufferings of the past, and it is possible that the development of these cities would not have been so complete or so satisfactory had they been constructed at their earliest inception on the lines of some general plan instead of by the troublous and slow development, piece by piece, they have been forced to follow.

Many of the newer cities in America and the Colonies, and also in some cases on the Continent of Europe as well as in the East and Far East, have been completely planned from their very commencement, and here one would think, with all conditions favourable, the nearest approach to perfection in town planning should be reached. In many cases indeed the result is the construction of a fine and spacious town, with abundant open spaces and streets of ample width. The very regularity of such a city may however become almost painful, with its monotonously straight and never-ending lines of buildings, with street after street all apparently the same and all apparently endless. The pedestrian in search of the other end of a street wearies from physical and mental fatigue, and still that painful unattainable end seems as far off as when he started.

Partial town planning, such as that involved in the planning of suburbs and the general lines on which the development and extension of an already existing town shall proceed, is of more modern growth, and it is to this modern tendency that our attention is most naturally directed. Garden suburbs and model villages have been introduced in many localities, but so far the initiative in this direction has been left almost entirely to private enterprise. In very few cases has provision been made for anything like a complete or satisfactory scheme of transition from the bustling activities of the central portions of a city, through the districts devoted to trade and residences, out to the fresh beauty of the country beyond.

Town planning, as we know it, is but a development of the best points in existing systems and their adoption to a greater or less extent to the special requirements of the particular community. With the exception perhaps of the newer parts of Edinburgh, Eastbourne, Bath, and one or two smaller towns, very little definite planning has been carried out in Great Britain. The subject however is at last a living one in this country, and it behoves us to profit to the utmost of our powers by the experience of Continental and other nations who have adopted previous systems of town planning.

In Prussia and other parts of Germany, the municipal authorities have for many years been possessed of special powers to enable them to regulate the growth and extension of the towns under their control, and since the passing of the Prussian Street Lines and Building Lines Act, 1875, and even before that date, it has been customary for the town councils to prepare a building plan for the gradual extension of the town and the laying out of the principal new streets within a reasonable radius of the already built up area. With a view to securing healthy conditions, towns are frequently divided into zones or districts, special restrictions as to height and area of buildings being applicable to each zone.

Technical writers in Germany have also turned their attention to the compilation of many excellent works dealing in detail with the preparation of town plans and the study of the examples of the past. Among these may be mentioned the names of Stübben, Baumeister, and Sitte, the latter of whom has made a close study of a very large number of mediæval and other towns whose charm is undeniable, and in particular of the architectural effect produced by judicious planning and grouping of buildings. We all know the delightful fascination of those old world cities, such as Nuremberg and Rothenburg, whose main charm lies perhaps not so much in their scientific planning as in the apparent haphazard grouping of the buildings round some quaint old market place or minster. Even in England our cathedral cities and many of our country villages stand out as possessing in some way a character of their own, often enhanced by some local association or special object of interest, such as a market cross or a village fountain. There is room, much room, in our modern work-a-day world for many such villages, for anything which will give us inspiration and raise our thoughts out of the deadly monotony of the evergrowing and overgrowing suburbs of our modern towns.

One of the causes which has enabled many German towns to develop on a definite plan has been the existence from the earliest times of a large number of reigning princes and grand dukes, who have generally been in close personal touch with their cities and towns, and have thus been in a position continually to plan and improve the principal towns without opposition, the rivalry between neighbouring principalities also being frequently effective in securing magnificent improvements.

The rigidly rectangular plan possesses the advantage of being simple and easily understood, as well as of facilitating setting out and economical building. Direct transit from point to point is, however, from the nature of things impracticable in the majority of cases, though by the aid of a good system of tramways or public vehicles, this defect can be greatly minimised. It may be taken almost as a definite rule, however, that there are in every town or centre, whether new or old, certain well-defined, though possibly irregular

Digitized by Google

lines of route or main roads leading from the outskirts into the central portions of the city, and the rectangular alignment of the streets thus frequently resolves itself into a series of separate districts sometimes aligned at varying angles.

The disadvantages to which a strictly rectangular system is subject, if there are no diagonal or other streets in an oblique direction, are plainly apparent, and to remedy this what may be termed the "triangular" system has occasionally been introduced. The object in such cases is usually to provide the shortest possible route between any two points, or in other words to facilitate "short cuts" for traffic; the incidental effects achieved should also be to open out architectural vistas in numerous directions, culminating in many instances in public monuments or monumental buildings. It must not be overlooked, however, that any triangular system of this nature inevitably produces irregular building plots, and also has the effect of concentrating traffic at the principal circuses or squares formed by the intersection of the rectangular or diagonal streets. Anyone remembering for a moment the effect of concentrating five or six streets at the corner of the Mansion House and the Bank of England will appreciate the necessity for ample space to be provided at such intersection if the traffic is not to be hindered unduly. It should be noted, too, that in that instance the principal lines of traffic are really only in two or at most three directions.

The radiating system is perhaps the ideal one, if the "hub" is of sufficient attraction or importance to the community. This system is well illustrated by the laying out of the town of Carlsruhe about 1715—another example of the power of ducal government. More modern examples of town planning than that of Carlsruhe are afforded by the cities of Cologne and Frankfort-on-Main. Both these towns have been fortunate in preserving the space formerly occupied by the encircling walls and fortifications as a ring of public gardens or parks around the inner city, thus obtaining a broad boulevard or ring strasse, something like that which has helped to make Vienna so famous. The development of the outer suburbs also is proceeding on a definite plan in both Cologne and Frankfort. The town plans in these cases have been prepared with a view to the probable requirements of the city for many years to come, and as will be seen from the official plan of Frankfort it will probably be many years before the full advantage of the scheme is obtained; in the meanwhile, however, many thousands of dwellers in the vicinity of the broad boulevards and tree-planted streets are receiving the advantages that come from abundance of open space and fresh air in pleasant surroundings.

But it must not be overlooked that these wide streets are very costly as regards both the land which they occupy and the actual cost of construction. In the majority of cases the whole cost falls upon the owners, and the natural consequence is that in order to recoup this outlay the rents are forced up and as many people as possible crowded into the high tenements or dwellings which are so often a feature of the German towns. Thus, although to outward appearance a fine city may be secured, it does not by any means follow that overcrowding and its attendant evils are removed. The population in the leading German towns varies from about thirty to fifty persons for each house, that of Berlin reaching 52.6 persons per house.

So far we have dealt mainly with straight lines and with regular systems, but probably the cities which really most charm us and which live in our memories long years after we have visited them, are the quaint old-world places, with their irregular streets, their quiet dreamy squares or their bustling market places, withal overshadowed by some grey old minster or some monument of the past; or perhaps our thoughts stray to some quaint cluster of houses nestling round its village green. Wherein lies their undeniable charm? To what extent, and within what limits can their quaintness, their subtle attractions, their very irregularities be imitated at the present day, or rather—is it still possible to catch a little of the spirit, a little of that innate love of the beautiful which seems to have been part of the lives of those old craftsmen who have gone before us? Much of the charm of these cities is undoubtedly due to their associations and to the atmosphere of antiquity which surrounds them, but beyond all these there are many things which may well be studied with advantage by the most-up-to-date of town planners. Sitte's book, already alluded to, deals with this aspect of town planning in a most fascinating manner, and shows how town after town of mediæval times owes its picturesqueness, its quaintness, and often much of its artistic charm to the skilful grouping of the buildings, and perhaps above all to the intuitive sense of proportion in the —to us—haphazard dimensions and arrangement of the public "places," and to the irregular outlines of the street frontages.

Modern requirements demand that the streets shall be of ample width, and there can be no two opinions that the tree-planted street with its welcome shade and refreshing greenness is to be preferred to the narrow street of the older type or to the barren and scorching wilderness of dust or paving which is unfortunately so often typical of the modern city. There does not, however, appear to be any reason why we should not adopt at any rate a few of the principles which seem to have guided our forefathers to such successful results. It sounds almost sacrilege to say it, but it is just possible that our building acts and bye-laws may be in some way a mistake, that our rigid enforcement of building lines and regulations apparently aiming at establishing a perfectly straight unbroken expanse of blank wall—miles of it—without a projection of any sort if it can be avoided, may be misguided.

In laying out a new town or portion of a town the necessities of the future will naturally have precedence over all other considerations, and due regard must be given to:—(1) The lines and widths of main routes and directions of principal subsidiary streets, having regard to prevailing winds, traffic requirements, preservation of views, &c.; (2) Public buildings to be provided, churches, schools, public halls, theatres, baths, libraries, post offices, municipal buildings, and such like—their number and probable size; (3) Open spaces to be provided for (*a*) playgrounds, parks, and recreation grounds, (*b*) public squares, having regard to probable extent and grouping of public buildings, monuments, &c.; (4) districts to be reserved for factories and dwellings, and zones for limits of heights of buildings (if any).

Modern traffic requirements demand that all parts of a city shall be accessible to rapidly moving vehicles and, particularly since the advent of the motor, the idea seems to be general that these streets shall be as straight as a dart. The widths to be provided for the various classes of streets are of the utmost importance, and the possible direction of future lines of route should as far as possible be anticipated. The lesser subsidiary streets will naturally be planned in each case with due regard to the contour of the ground, direction of prevailing winds, access to railway stations and other points, and last but not least the question will have to be considered whether a straight or curved street is to be adopted. The cost of making up streets, macadamised or paved the full width, is considerable, and it would in many cases be cheaper and more effective to make up only the width necessary for the actual traffic, leaving grass margins at each side.

The approximate widths of various important streets are given below:—

	Feet.
London—Kingsway and Aldwych Blackfriars Bridge	100
Victoria Embankment—near Westminster Bridge	130
Whitehall—widest portion	120 to 145
Holborn Viaduct and Northumberland Avenue	90
Regent Street Quadrant	85
Piccadilly	75
Queen Victoria Street	70
Oxford Street— Near Oxford Music Hall Near North Audley Street	58 to 88
Cheapside and Fleet Street	48 to 60
Edinburgh—Princes Street	100
Paris—Champs Elysées	230
Avenue de l'Opéra	93
Washington—Main Avenues	120 to 160
Vienna—Ring Strasse	186 to 200
Berlin—Unter den Linden	190
Frankfort—Ordinary tree-planted roads	65 to 78
Wider promenades	115

Broad straight thoroughfares are naturally best adapted for monumental avenues leading directly to some national or civic building of sufficient importance, and possibly it might also be added for main through roads conducting one to important towns. It is at least questionable, however, whether long straight streets do not lose much of their effect if constructed in too great profusion, and without any special objective. Such an avenue should have some special *raison d'être* to justify its existence, and it should terminate in something more inspiring than a dust destructor or a house of refreshment.

COUNTRY HOUSE NEAR SAINT-ETIENNE.—M. ODIN, Architect. [From *La Construction Moderne*.

THE METHODS OF PAINTING ON STUCCO.*

THE ground upon which decorative efforts are made is something more than a mere surface. It is a foundation to which all colouring is an added quality. This is especially so with lime, which in past ages and with all nations has served for the interior surfaces of human habitations. Ancient remains, not only of lime surfaces but of added embellishment, bear a conclusive testimony to its permanence. At times in the world's history, when mural decoration was the occupation of men of genius, lime formed the ground for their greatest efforts. Thus upon this material has been produced the grandest of paintings. Apart from its permanent character, lime in its own nature is clear and bright, without gloss. It has that internal light which is aimed at in all fine colouring. Thus it is eminently suitable for a wall picture, lime painting well carried out resulting in that effect called "atmosphere," lime having a power of reflecting light, conveying that sense of spaciousness which is so desirable in all decoration. So favourable for the reception of colour has such a material been considered, that the Italian artists of the Renaissance prepared a surface of plaster of Paris for their large canvas pictures. Upon this they spread their colour with nothing except the medium which bound them between the lime and colours; a method by means of which even the lakes retain their tone for hundreds of years, and remain to-day in evidence of the harmless character of a lime ground.

In the finer specimens of the ancient wall paintings the lime ground was always considered, not only in its preparation, but also as entering into the painting itself. There are evidences that every advantage was taken of its special qualities. By means of pure water colours were used which were innocent of any disagreement with the lime. These were applied upon plaster freshly laid; the colours then penetrated the ground. Lime in the form of whitening was

TOWN HOUSE, AVENUE DE MESSINE, PARIS.—M. LAVIROTTE, Architect. [From *La Construction Moderne.*

used as a white pigment. It therefore entered into the composition of all the tints, even into the shadow tones. Thus the painting and the ground itself were intimate, and of one nature. It could not then be said that the beauty of such a painting was only skin deep. In this way of working, called the "fresco buono" method, the excellent qualities of lime were shared both by the painting and the ground.

There were many ways possible of working in this masterful method. The painting could be executed either in impasto or glazes, or in a combination of both. Owing to difficulties existing in this process, it was necessary to entirely finish on the wet plaster a small portion of a large picture in one painting, the painter following the plasterer. A change also took place in the tone of the colours not only during the painting but for days afterwards. It was therefore necessary that a plan should be first thought out and rigidly adhered to, an idea of which may be formed from a description of the method adopted by Professor Pasciano when painting a head.

When working upon the newly-laid plaster, the professor had two earthenware pots, in one pure lime, in the other a very pale flesh tint. A lump of dry umber was reserved to try the colours on. He first painted the nimbus surrounding the head a pale yellow (he was copying the head from a coloured drawing), then he painted the head and neck a pale flesh colour, putting the colour in the cheeks and painting the mouth and eyes in slightly. Then he shaded the hair and drapery, deepening always with the same colours, which became darker and deeper every time they were applied, as they would upon paper. Having worked in this way for half an hour, he made a halt for ten minutes to let the colours sink in, which time he occupied himself in mixing darker tints, and then began loading the lights, using the colours much stiffer, putting his colours with precision and firmness, softening with a brush and a little water. He then again rested for ten minutes, but by this time he had the head nearly finished. He then put in a few light touches in the hair, again lightening the lights, touching also the

Digitized by Google

darks, putting a little light in the nimbus. He again increased the number and density of his tints, finishing the whole head in one and a half hours.

"As when the hand some mimic form would paint,
It marks its purpose first in shadows faint.
And next, its stores of varied hues applied
Till outlines fade, and the full limbs arise."

Admirable as is the buono process for the achievement of a grand general effect, it has ever been found unmanageable for the smaller portions of a large picture. In the fine old wall paintings, when the utmost that the buono process was capable of was attained, to the same colours oleaginous, fatty or waxy matters were then added in order to obtain the facility necessary for the carrying out of small detail. This latter method was called "fresco secco" or "fresco mezzo" by Italian artists to distinguish it from the grander process, "fresco buono." Actually they both come under the name "tempera," which may be broadly defined as any process in which the colours are made up with a siccative and used bodily by means of water.

There are fine frescoes of the twelfth and thirteenth centuries in this country in a good condition still. Modern experiments, however, have not always been so complete a success as the older work has been. Even so great an artist as Watts, devoted as he was to fresco painting, in spite of his years of experiment had cause to lament that his work so soon showed signs of decay. The weakness of a fresco may occur from the simplest of causes. It may exist from the condition of the lime itself, it may be from attacks from without, or it may be brought about from a conflict set up between the lime and mineral pigments applied to it. The lime must be completely slaked so that no free lime is present. Fabulous statements have been made as to the length of time necessary to ensure this; that in Italy the grandson uses the lime the grandfather had laid down. As a matter of proved fact, lime may lose its best qualities if left slaking too long. The ordinary lime putty endures the wear and tear of our dwellings. If there is any doubt as to its condition, letting it lie in our own private lime pit for a few months will ensure its entire conversion. To do this is a better way than to make a surface of fresh lime and then leave it for a lengthy time before painting upon it. Even if then it is thoroughly opened by any means, it is far less favourable for the reception of colour than if first completely slaked and then laid for the immediate reception of colour.

There is no doubt that the damp, variable, acid-laden atmosphere of our cities is deadly in its effects upon a lime painting. Against this evil it must be protected, both from the back and the front. Every effort to divert moisture away from the painting must be taken. If it were rendered acid proof and waterproof it would be protected from its greatest enemy, and would further allow deposited dust to be washed away from its surface without damage, provided mechanical action is avoided.

Again, if only those pigments were used which agree in nature with the lime, no chemical reaction would occur.

For tempera painting, many substances have been adopted to spread and fix the colours such as fig tree juice, molasses, gums, &c., but perhaps of the many materials which have been tried caseine offers the greater possibilities. It mingles with lime with lasting results, ammonia acting as an alkali, whilst glycerine helps to dissolve it. When dissolved by means of these substances, and boiled linseed oil is added to it, an excellent emulsion is the result. It then forms a capable medium. One painting can be used over another, either in impasto or in glazes. It retains the fulness of colour natural to the pigments, without gloss, and there is no material difference in the colours in drying. If a wash of formaline is passed over the painting when it is finished it then becomes altogether washable, and absolutely resists damp.

Although caseine, mixed with lime or zinc white and used as a ground, does not change in its colour, remaining a permanent white, it is liable to crack if laid on too thickly. It also loses its virtue as a medium if kept for a time. It is less strong the next day after it has been made. It is best to use the emulsion directly it has been made.

Coagulated albumen offers another endurable medium with which to bind colour. The tenacity of such work may be proved by a description of a few tested experiments and the results. A strong wooden frame was lathed and received a rough rendering of Roman cement, which was chosen as being the nearest in nature to the celebrated pozzuoli of the ancients. Both sand and broken brick served to bind and give solidity to the rendering. After this was well scored, a second coat was applied, composed of white stone lime putty, a little Roman cement and marble dust. The finishing skin was lime putty, to which a little marble dust was added in order to get that "tooth" which is so agreeable for working upon in large work. The several coats were well trowelled (I believe plaster cannot be trowelled too much). They were worked one over the other whilst the under coat was damp, in order to obtain attachment between the several coats. The subject was painted in whilst the ground was green, the following colours being used:—

Whitening, yellow ochre, brown ochre, Roman ochre, the siennas, vermilion, venetian red, madder, the umbers, terra vert, ultramarine, cobalt blue, cobalt green, black. The medium used was obtained by whisking up the entire egg, yolk as well, in olive oil, as advised by Latilla. Oil is very friendly to lime, it causing the colour to be manageable. It is, however, the albumen in the egg which, when coagulated by the lime, remains as a permanent binder to the colours. After the finished painting had remained for a few days it could be gently washed. To still further fortify the work from the action of damp, a couple of coats of hydrofluoric acid were passed over the face of the painting, with an idea of giving to the stone the insoluble nature of feldspar, from which fluoric acid is obtained. Thus from damp the work was doubly sealed and could be satisfactorily washed with soap and water, although a soft sponge and pure water sufficed to remove deposited dust.

OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* has an interesting article on "Some Essentials of Chimney Construction," by Mr. Arthur C. Bein, which is trenchant in its criticism, and advocates the use of a "wind-shelf," a device that has many friends but no scientific basis. Illustrations are given of the Orient Insurance Company's offices, Hartford, Conn.; the First National Bank, Hoboken, N.J., and the First National Bank Building, Lynchburg, Va., all classical buildings.

La Construction Moderne illustrates the new buildings for the post and telegraph department on the Cité Martignac, of which M. François le Cœur is the architect, and the tomb of Constant Coquelin at Pont-aux-Dames.

Deutsche Bauzeitung continues its articles on "Modern Synagogues," and now deals with the new one in Dessau. It also describes with views the new Rath-haus at Rixdorf, which has been illustrated in our series of examples of Modern European Architecture.

Der Profanbau has an account with very complete illustrations of the remarkably fine building of the Leipzic Life Assurance Society, the architect of which is Baurat A. Käppler, whose design, free from all "new art," shows that good work on purely Renaissance lines can still be found in Germany. That the "new art" feeling lends itself well to some classes of detail is seen from an article on "Cast-iron—old and new."

Moderne Bauformen this month devotes itself to the work of Dresden architects, much of which is domestic, though other buildings are included, even a gas-holder which is quite a successful piece of architecture. The club-house of the famous "Borussia" corps at Tübingen is topical just now.

The *Engineering Record* has an interesting illustrated account of the erection of a dome 98 feet internal diameter without centering at the cathedral of St. John the Divine, now in course of erection at Morningside Heights, New York City. After this one need not doubt the possibility of the dome of the Pantheon having been erected without centering.

The King of Portugal on Wednesday received a deputation of the British Fire Prevention Committee at the Portuguese Legation, and accepted an address presented on behalf of the Committee. One of the pioneers of the fire prevention propaganda of Europe was the late Chief Officer of the Oporto Fire Brigade, Mr. Fernandes, who was an honorary member of the British Fire Prevention Committee and an active supporter of its work both at home and on the Continent.

The National Trust for Places of Historic Interest or Natural Beauty have made an appeal, which has the support of His Majesty the King, for funds to purchase the land now offered for building lying between the Alexandra Gardens and the Curfew Tower at Windsor, in order that the greensward and trees may be preserved and the beauty of the famous view of Windsor Castle from the Thames may thus be saved from serious injury. The trees are of especial importance as they mask the gasworks and the railway station.

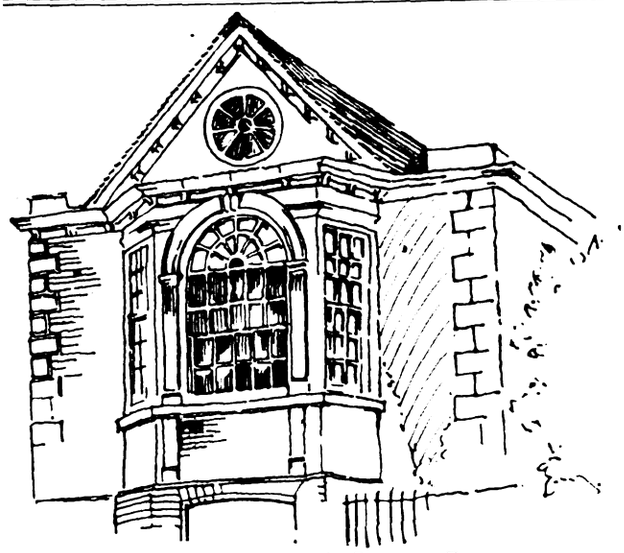
ENGLISH LEADWORK.

As a material possessing capabilities of workmanship and an artistic expressiveness peculiarly its own, it is not surprising to find in these days of specialisation amongst antiquaries and connoisseurs that lead has completely captivated and enthralled at least one enthusiast. It is only by such specialisation and such attraction that one could hope to have the advantage of the complete and sumptuous monograph * on English leadwork that the learning and industry of Mr. LAWRENCE WEAVER has put into the hands of the architect, the sculptor, the craftsman, the owner and lover of gardens.

That lead has an individual character of its own will scarcely be questioned by anyone who takes the pleasure, rather than the trouble, of following Mr. WEAVER in his historical exposition of the use of lead combined with admirable criticism of the right or wrong treatment of the material in the numerous examples of old work of which he gives description and illustration.

No longer would it be supposed that, apart from its utilitarian employment, lead is suitable for decorative purposes merely because it is cheaper than bronze, more durable than iron or easily cast into ornamental form and painted to look like stone. Apropos of the facility with which lead can be cast and painted to look like something else, it may interest our readers to know the origin of the lead ornaments of the screen at Worstead Church of which the author speaks. When we were measuring this screen some quarter of a century ago the then sexton told us that when he assumed the office much of the carved ornament had been broken away, so as he could not carve wood he took moulds of what was left and cast replicas in lead to replace the missing work. Thus the leadwork on Worstead screen belongs to the last half of the nineteenth century. Whether the same remark applies to Ranworth we cannot say, for when we were there no one, sexton or other, seemed to have much pride or interest in this gem of East Anglian screenwork. We do not fancy that the original makers of the Norfolk screens would employ lead, as they were well acquainted with and frequently used gesso for casting repeated ornaments as well as for brush work in relief.

The disregard of the nineteenth century for lead, of which our author speaks, was probably largely due to the aversion which arose at the end of the eighteenth century, or soon after, for any work of architecture or sculpture which was not white. The men of that day were not content to wait for the patina which, as Mr. WEAVER points out, is one of the most charming attributes of old leadwork; they wanted everything white at the start, and it is quite possible that there may exist examples of early nineteenth-century work which, masquerading as stone under repeated coats of paint, have failed to reveal their true material.



Mr. WEAVER has possibly done right in his exhaustive treatment of the history and use of lead to ignore, save for a couple of incidental references, the closely allied material, pewter, but in considering the modern artistic employment of lead it is worth noting that in Germany this alloy was very commonly preferred for sculpture and architectural ornament, whilst our English craftsmen were working in lead. It must not be forgotten, however, in this connection that the treatment which is suitable for lead cannot be exactly imitated in pewter without ignoring the characteristic expression peculiar to the alloy. Tinning as a superimposed decoration is evidently regarded by Mr. WEAVER as a legitimate treatment of lead, and there is surely, therefore, no reason why a designer should not avail himself of the potentialities of an alloy of lead and tin. In the wider sphere of the application of metals as accessories of architecture we may also bear in mind the modern alloys of aluminium, which have not yet been exploited to any extent as material for artistic expression.

The author's scheme in the treatment of his subject is the historical review of the use of his material under the heads of the various features in which it was principally employed. Thus we begin with fonts, and we are given the description and illustration of the thirty that, as far as Mr. WEAVER knows, and probably no one knows better, make up the total of those remaining. Of these more belong to the Norman period than to any other, and geographically more exist in Gloucestershire than any other county, whilst none are found north of Lincolnshire. As Mr. WEAVER points out, several of the Norman fonts are replicas of one pattern. So are many of the stone fonts of the Perpendicular period in East Anglia, and if lead was used at that period for the screens at Worstead and Ranworth, why was it not used for the fonts?

Two chapters are devoted to rain-water heads, one of the most favourite applications of decorative leadwork, and hence furnishing the author with much material which he has ably and fully utilised. Mr. WEAVER treats of spires, both Mediæval and Renaissance, of domes and lanterns. But it is when our author comes to portrait statues, lead figures generally and vases, the accessories of garden architecture, that we reach the divisions of the subject which we opine will at the present day be most generally studied and enjoyed. Very carefully and thoroughly has the history of the sculptors who worked in lead during the seventeenth and eighteenth centuries been investigated and recorded. The treasures of the gardens of Melbourne, Wrest Park, Wilton, Nun Monkton, Hard-

AT RYE.—From a Sketch by Banister Fletcher.

wick, Glemham and other notable houses are illustrated and described with in many cases identification of their designers and founders.

Our author commences his chapter on modern leadwork with a reference to the pessimistic utterance of the late Mr. J. Lewis Andre in 1888, when he said in a paper on English ornamental leadwork:—"I am compelled to come to the conclusion that most of the applications of ornament to leadwork belong to bygone times, and that a revival at the present day is hardly to be expected." It is the pleasure of Mr. Weaver to show the contradiction of this prophecy by putting before us instances of some of the excellent modern leadwork designed by architects of the present day. The examples given and our own experience point to the conclusion that the most troublesome characteristic of modern leadwork to the artist is its tendency to assume an undue sense of sharpness, which Mr. Weaver attributes to the influence of cast iron, but which we think is due rather to the spirit that actuates the best workmen amongst building operatives. Their idea seems to be that their highest aim should be to attain a precision in the handling of tools that will bring their work as nearly as possible to the mathematical precision of a machine. We are far from saying that the ideal of the highest possible technique in the handling of tools is unworthy of the craftsman, but there is a danger that in the attainment of this ideal the natural expression of a material may be lost.

The engineering trades have set up so high a standard of mechanical precision in workmanship that it is not surprising to find in the building trades the work of the joiner, the mason and even the plumber, especially as he sometimes works in zinc, approximating in our time to the precision of the man who makes an engine and who is constantly testing his work by gauge and micrometer. Our modern craftsmen in the building trade need to have developed their perception of the artistic expression of the material in which they work. Then it would not be necessary for architects to specify that half-timbering is to be worked with an adze or to adopt any other devices to escape from precision of workmanship in the attempt to capture artistic feeling. After all, precision of workmanship is a characteristic of our time, and, given the union with it of artistic perception and feeling, our modern work ought to surpass in artistic result the work of the past.

To assist in the development of the artistic perception and feeling of the leadworker every technical institute and every free library should possess at least one copy of Mr. Weaver's charming book, and every architect who desires to include in his buildings leadwork artistically worthy to stand alongside that of the past should see to it that his plumber's attention is drawn to the lessons that Mr. Weaver teaches. Every such architect will, of course, give a place in his library to the only book that adequately and completely shows what English leadwork has been and can be.

NOTES AND COMMENTS.

Another instance of the treatment which architects who win competitions for municipal buildings may suffer is afforded by the experience of Messrs. Russell & Cooper at Burslem. After modifying their designs very considerably to meet the views of the Town Council, and preparing everything ready for quantities and tenders, they are faced with the possibility that the work may not go on after all. A town's meeting on November 10 resolved that a poll of the ratepayers should be taken on the question whether Burslem should have a new town hall or not, and now the Town Council has virtually endorsed that demand, but postponed its final decision till the tenders are received a fortnight hence. Apparently, from the report of the Council meeting, the only alternatives to be decided at the postponed meeting of the Council are whether that body shall itself give the *coup de grâce* to the scheme or shall leave it to be determined by a poll of the ratepayers. Here is a chance for the Board of Professional Defence of the Royal Institute of British Architects to justify its existence by taking care that competitions shall be barred by the Council when there is no certainty that the work competed for will ever be carried out. If public authorities generally are going to follow the example of Burslem it will be high time that the architectural profession should see to it that the German system is adopted and premiums offered that are worth trying for, independently of the job, instead of being, as they are with us, so small that usually the second man just covers the expense of his competition drawings, and the recipient of the third premium gets about half what his drawings cost him.

The present by-laws of Birmingham relating to new streets and buildings being in a rather chaotic condition, the City Council has resolved to adopt new ones as regards buildings, which not only bring together scattered enactments, but are more up to date so as to deal with hollow walls, the determination of the length of walls by piers as well as by cross-walls, the use of steel-frame construction and other modern improvements in buildings both constructional and hygienic.

Although the demolition of the north side of Bath Street, in the city of Bath, has commenced, the Old Bath Preservation Society is keeping up the fight and means to die in the last ditch, as expressed in the following resolution:—"This committee, observing that a portion of the north side of Bath Street is now being prepared for demolition, expresses its surprise and indignation that the Corporation of Bath should not only have failed to interfere to prevent this injury to the city, but should actually have brought pressure to bear on Messrs. Waring to proceed with the scheme, and this after the remarkable body of testimony from the Royal Institute of British Architects, the Society of Antiquaries, the Society for the Protection of Ancient Buildings, the National Trust for the Preservation of Places of Historic Interest, from many eminent persons and from leaders of opinion connected with the principal London newspapers and the Press generally, that the destruction of this unique street would be a loss to the city and a deduction from the reputation of Bath. The committee further resolves to communicate this resolution to the Corporation, to Messrs. Waring, and to the London and provincial Press, in the hope that the mischief may even yet be averted." We fear the hope of the committee is without foundation.

There seems to be little doubt to any unprejudiced person that Dr. Bode and the Berlin Museum have been "had" in the matter of the wax bust of *Flora* that has been purchased as the work of Leonardo da Vinci. The front view accords with the picture by Da Vinci, from which Lucas is said to have modelled the bust, but the side view and profile bear clear evidence of early Victorian feeling. Leonardo's unquestionable wax models are in pure beeswax; the Berlin bust is filled in with wax mixed with resin and wrapped in nineteenth century cloth.

Digitized by Google

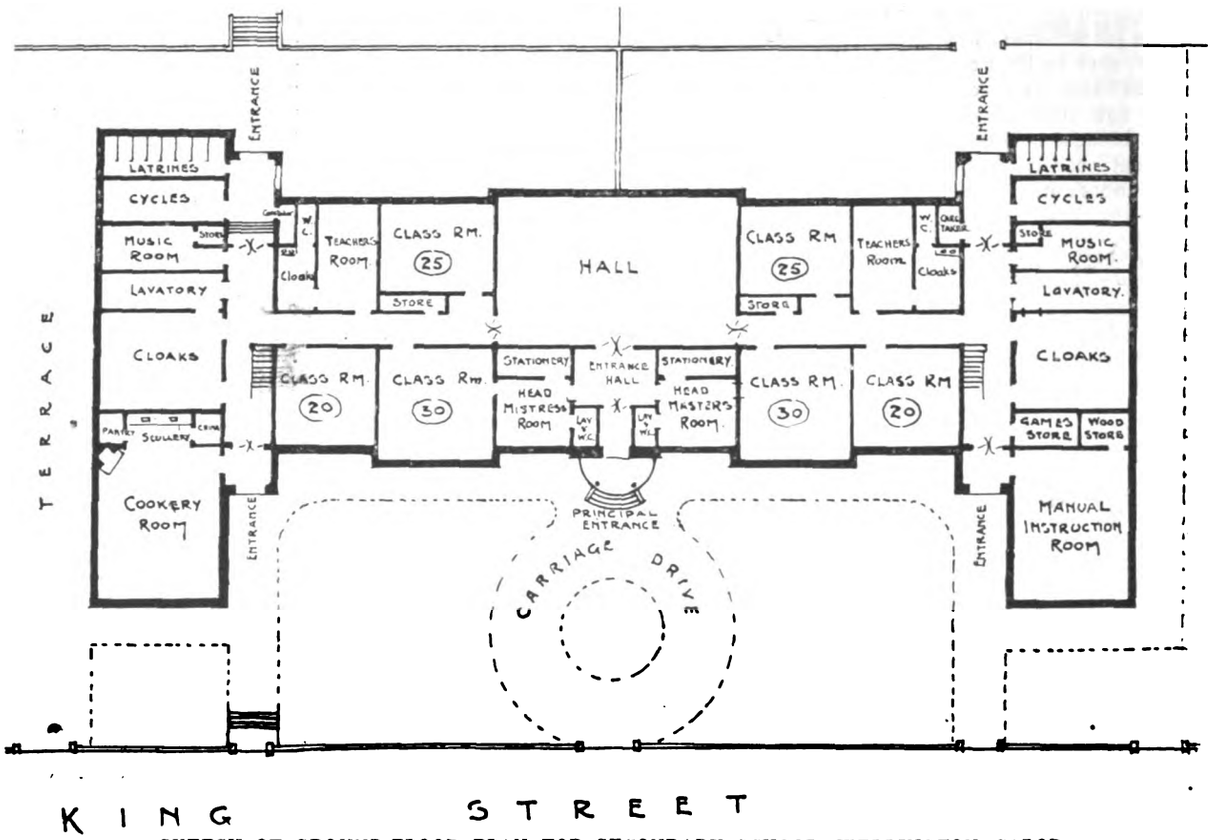
What a commentary on the folly of paying absurdly inflated prices for antiques, when a learned and experienced connoisseur, such as Dr. BODE must be admitted to be, can be taken unawares, as it seems to us he undoubtedly has been. One can understand a high price being paid for a work of art because it is transcendently beautiful, a work of genius, but not that 90 per cent. of the value depends on its age and its authenticity.

THE purchase of antique works of art is to-day as much a species of gambling as dealing in cotton or copper for forward delivery. Sometimes the gambler makes a good thing out of his speculation, and this class of patron of art will be encouraged to plunge a bit more by the report of the latest deal in Rembrandts. M. PAUL DELAROFF, Privy Councillor, of St. Petersburg, bought a Rembrandt, genuine on the authority of Dr. BODE, a few years ago for 4,000*l.* and has now sold it to Messrs. AGNEW for over 15,000*l.* The latest purchasers know their business, and we may be sure will make a profit on the deal, and so the game of inflated prices goes merrily on and will continue to go on whilst millionaires are still to be found who measure the value of artistic treasures by the number of dollars they pay for them.

WE are going to have something extra good in the way of exhibitions and pageants next year. The Anglo-Jap at the White City should be interesting for its artistic merit. The Festival of Empire at the Crystal Palace should touch the Imperialist sympathy. Sir ASTON WEBB, R.A., is connected with this latter venture, and has cut the first sod of the open-air theatre on the Greek model, in which is to be presented the pageant that is to unfold the history of London. Perhaps the promoters of the scheme have an idea that, as the Lord Mayor's Show this year was denuded of its circus element, the people of London will rush in their thousands to the Crystal Palace for consolation.

MR. E. DORAN WEBB, F.S.A., at the invitation of the University Extension Lectures Association, has been lecturing at Salisbury on Old Sarum, the seat of one of the earliest manifestations of civilisation in this country. His lecture was divided into four parts, dealing first with the conjectural history of Old Sarum, with the tribal conditions of the people; secondly, with the Roman occupation; thirdly, the Saxon invasion down to the time of the transplanting of the cathedral to New Sarum; fourthly, to our own time. The excavations have been suspended till the spring, and it is estimated will require an expenditure of some 600*l.* to 700*l.* for eight or ten years.

THE *City Press* has reprinted from "Hone's Year Book," published in 1832, the following table of the cost of WREN'S London churches and the Monument, and if the figures generally are as correct as the exactitude of the farthings would imply, it is a valuable record:—



The cost of the London churches built by Sir Christopher Wren, including the Monument.

St. Paul's Cathedral	£736.752 2 3½
All Hallows the Great	5.641 9 9
All Hallows, Bread Street	3.348 7 2
All Hallows, Lombard Street	8.058 15 6
St. Alban, Wood Street	3.165 0 8
St. Anne and Agnes	2,448 0 10
St. Andrew Wardrobe	7,060 16 11
St. Andrew, Holborn	9.000 0 0
St. Antholin	5,685 5 10¾
St. Austin	3,145 3 10
St. Benet, Gracechurch	3,583 9 5¼
St. Benet, Paul's Wharf	3,328 18 10
St. Benet Fink	4,129 16 10
St. Bride	11,430 5 11
St. Bartholomew	5,077 1 1
Christ Church	11,788 9 6
St. Clement, Eastcheap	4.365 3 4½
St. Clement Danes	8,786 17 0½
St. Dionis, Backchurch	£5.737 10 8
St. Edmund-the-King	5,707 11 0
St. George, Botolph Lane	4,509 4 10
St. James, Garlick Hill	5,357 12 10
St. James, Westminster	8,500 0 0
St. Lawrence Jewry	11,870 1 9
St. Michael, Basinghall	2,822 17 1
St. Michael Royal	7,455 7 9
St. Michael, Queenhithe	4,354 3 8
St. Michael, Wood Street	2,554 2 11
St. Michael, Crooked Lane	4,541 5 11
St. Michael, Cornhill	4,696 5 11
St. Martin, Ludgate	5,378 18 8
St. Matthew, Friday Street	2,301 8 2
St. Margaret Pattens	4.986 10 4
St. Margaret, Lothbury	5,340 8 1
St. Mary Abchurch	4,922 2 4½
St. Mary Magdalen	4,291 12 9¼
St. Mary Somerset	6,579 18 1¼
St. Mary-at-Hill	3.980 12 3
St. Mary, Aldermanbury	5.237 3 6
St. Mary-le-Bow	8,071 18 1
St. Mary-le-Steeple	7.388 8 7¾
St. Magnus, London Bridge	9.579 19 10
St. Mildred, Bread Street	3.705 13 6¼
St. Mildred, Poultry	4,654 9 7¾
St. Nicholas Cole Abbey	5.042 6 11
St. Olave, Jewry	5,580 4 10
St. Peter, Cornhill	5.647 8 2
St. Swithin, Cannon Street	4.687 4 6
St. Stephen, Walbrook	7,652 13 8
St. Stephen, Coleman Street	4,020 16 6
St. Vedast, Foster Lane	1,853 15 6
The Monument	8,856 8 0

THE limiting of competitions by geographical area has at Oldham resulted in some rather amusing episodes. The competition for the extension of Oldham's town hall is to be limited to architects residing in the borough. Thereupon an architect residing outside the borough—wise man!—but with an office in town, asked if he might compete. Another, who not only resides, but apparently has his office outside the borough limits, thought he was eligible because his gas was supplied by the Oldham Corporation. The finance committee of the Council held that neither of these gentlemen was eligible. Hard lines!

INTERESTING results have been reached in the excavations at Corbridge, the Roman Corstopitum, which have been going on since 1906, and were described in a lecture to the members of the Carlisle Scientific and Literary Society by Mr. R. H. FOSTER, M.A. The site of the excavations is to the west of Corbridge, on the north bank of the Tyne at a point where a Roman bridge carried Dere or Watling Street across the river. Unlike many Roman cities now overlain by modern towns, Corstopitum is situate in open fields, and by the aid of the foundations which have been uncovered an idea of the plan of the place, the direction of the streets and the character of the buildings has been disclosed. They incline to the arrangements common to a civil community combined with features more definitely military. In 1907 a large and important building, probably a private residence, which had been many times altered and extended, was discovered on the rising ground to the north-east of the bridge. In its latest stage it comprised a series of eight apartments arranged between two corridors, and returned at both ends towards the south. The south corridor was warmed by a pillared hypocaust below the floor, divided midway in its length by a door, the threshold of which is still *in situ*. Hypocausts of larger size but rougher construction were found under two of the rooms at the west end of the building, and one of the eastern rooms was warmed by a series of boxed wall tiles. The wall plaster on some of the rooms had been repeatedly decorated in colours. On the south front of the house there was a cobbled terrace overlooking the river below, and on the north an enclosed courtyard, paved with cobbles, and containing an ornamental cistern, in which was found a fine piece of sculpture of a lion and a stag. On the plateau to

SKETCH OF GROUND-FLOOR PLAN FOR SECONDARY SCHOOL, WELLINGTON, SALOP.
Selected Design by Messrs. Shayler, Swan & Ridge, Architects.

the north, and possibly in the central district of the city, massive and important buildings were encountered. These bordered on a street about 36 feet in width of three different levels, with corresponding drains and gutter stones. The buildings comprised a store in which, under a mass of burnt stuff, was discovered a quantity of pottery, strewn, as it had fallen from the shelves, in separate heaps. The discoveries of 1908 were most important and interesting. Operations were commenced on the wide east to west street through the town. They revealed on the north side four structures, two of them strong buttressed barns or granaries at right angles to the street and almost 100 feet in length; the fountain and a portion of a massive building comprising a number of chambers arranged about a quadrangle, the west range of which is 221 feet in length, and had for convenience been called the "Forum." Of the noteworthy finds, the most remarkable was that of a hoard of gold coins, forty-eight in number, enclosed, together with a gold ring, in a piece of lead, and secreted 18 inches below the present ground level in a building of late date. The coins included examples of the reigns of Valentinian I., Valens, Gratian, Valentinian II., Theodosius and Magnus Maximus, and ranged between the inclusive dates of 370-85. The coins were all in an excellent state of preservation, and with the exception of a find at Cleeve, near Cheltenham, in 1811, constituted the largest find of Roman gold coins made in Britain. The excavations of last year also produced a remarkable quantity of fragments of pottery, Samian ware being very abundant. Other kinds of pottery were also plentiful, ranging from Castor ware to rude black hand-made pottery. The work done during the past season (1909) has been important, if in some respects less striking, than in 1908. Further explorations in front of the granaries has revealed the fact that the southern or street face of each had had a portico of four massive pillars. In the case of the east granary, this portico was probably of the same date as the main building—viz. about A.D. 140. The other portico was of later date, and was probably added in the time of Severus to a building which possibly dated as far back as A.D. 120.

COMPETITION DRAWINGS FOR SECONDARY SCHOOLS AT WELLINGTON AND WHITCHURCH, SALOP.

In response to the Education Committee's invitation, twelve sets of designs were submitted for the Wellington School and nineteen sets for the Whitchurch School, and Mr. H. Beswick, F.R.I.B.A., of Chester, was appointed assessor.

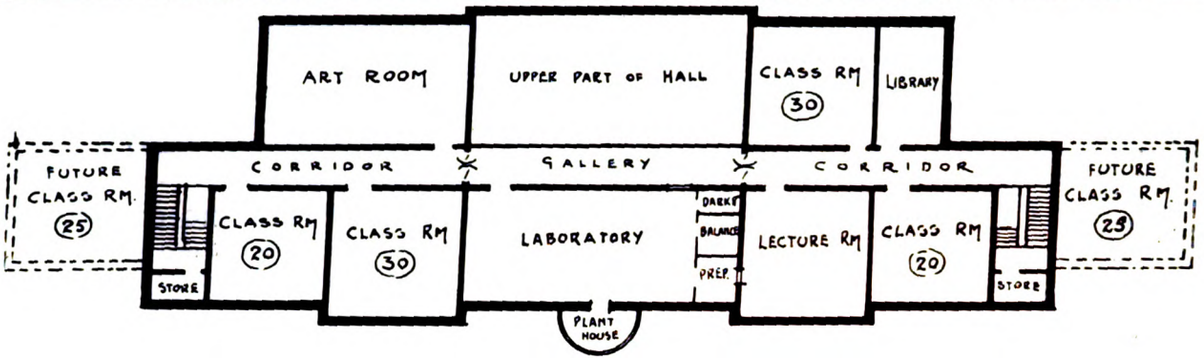
WELLINGTON SCHOOL.

The designs generally were excellent in conception and of good draughtsmanship.

The successful design is that submitted by Messrs. Shayler, Swan & Ridge, of Shrewsbury, Oswestry, and Birmingham, whose plans were highly coloured, with elevations nicely treated in the Georgian style, accompanied by a good half-inch detail.

The accompanying sketches will enable our readers to see the type of design accepted. We do not consider the positions or shape of the music-rooms ideal, and the cloak-room spurs with their respective cookery and manual rooms might with advantage be remodelled on the lines of Plan No. 3, which had the music-rooms to the front and the cookery and manual rooms in the rear.

We are of opinion that the amount the Committee stipulated as the cost of the building—viz., 7,000*l.*—will be insufficient, even with the 10 per cent. margin, as the sum has to include heating, lighting, ventilation, boundary walls, fencing and laying out playgrounds.



WHITCHURCH SCHOOL.

The selected design for this school is that of Mr. J. Holt, A.R.I.B.A., of Manchester, and many good points are embodied in the plans.

In this case also we doubt the sum allowed—viz. 5,000*l.*—being sufficient.

The two designs are both somewhat similar in arrangement.

FIRST FLOOR PLAN.

SKETCH OF FIRST-FLOOR PLAN FOR SECONDARY SCHOOL, WELLINGTON, SALOP.
Selected Design by Messrs. SHAYLER, SWAN & RIDGE, Architects.

PRESTON GRAMMAR SCHOOL COMPETITION.

IN response to the Committee's invitation, 179 designs were received.

The site is situated in a good position overlooking Moor Park, with frontages to Moor Park Avenue and St. Thomas's Road. At the east end of the site a plot is reserved for the erection at some future date of a headmaster's house.

The accommodation required was for 250 boys, with provision for two or more class-rooms in the future. The principal requirements were assembly hall with seven class-rooms (inclusive of sixth-form room) for senior boys, and three class-rooms for junior boys, the latter to be planned to form an integral part of the school, and be so arranged that they could be assembled or dismissed without interference with the rest of the school.

Mr. F. W. CATTERALL, of Preston, was appointed assessor, and his award is as follows:—

1st. Messrs. WOOLFALL & ECCLES, F.R.I.B.A., *Liverpool.*

2nd. Mr. A. J. GREENWOOD, Manchester.

3rd. Messrs. PACKER, DREWITT & DREWITT, A.R.I.B.A., Southport.

One of the conditions of the competition was that the school must be planned with an assembly hall, with the class-rooms approached conveniently from the hall or its galleries or corridors. Corridors must be avoided as far as possible, and where necessary should be short, well lighted, and of sufficient width to allow space for exhibition designs, models, appliances, and lockers. This clause naturally led competitors in general to adopt the central-hall type of plan with the class-rooms grouped round and entered from the hall—in fact, all the competitors with the exception of the first premiated adopted the type of plan.

Many of the designs were remarkable for the ingenuity displayed in reducing the corridor space to a minimum, and for their thought and trouble they are rewarded by seeing a design selected which has corridor round three sides of the hall, to say nothing of long covered ways to the latrines and manual instruction room, and a long length of future corridor to the future class-rooms.

The following extract taken from the *Lancashire Daily Post* of Thursday, the 25th ult., will be interesting to the competitors:—

Alderman Craven moved that the Council agree to the recommendation of the Education Committee that the premiums in connection with the competitive designs for the new Grammar School be awarded as follows:—

Design No. 9: Messrs. Woolfall & Eccles, Liverpool, 50*l.*

Design No. 97: Mr. Arthur T. Greenwood, Manchester, 30*l.*

Design No. 134: Messrs. Parker, Drewitt & Drewitt, Southport, 20*l.*

In moving the recommendation, Alderman Craven said the assessor considered that set No. 9 was by far the best both in plan and design, and the one that most nearly fulfilled the requirements of the committee. On an inspection of the plans the committee were unanimous in confirming the assessor's award. Set No. 9 was described as excellent, and was almost the only one that had a self-contained hall with open-timbered roof, whilst the character of the design was much more suitable for a grammar school than that of any other design submitted. The planning of the buildings was the most important from the scholastic point of view, and it was also not unimportant from the financial point of view—from the scholastic because on it depended the whole convenience of working, and from the financial because according to the compactness of the building and the utilisation of the space at command so would economy of building expenses be effected. The plans recommended appealed strongly on both these sides. They were conveniently grouped round one centre, the assembly hall, and every possible device for compactness, both in the buildings themselves and in the playgrounds and outbuildings, had been employed.

As an instance of this he might refer to the way in which the classrooms adjoined the assembly hall, whereby not only did each form become enabled to work as a separate unit without interference to any other unit, but whereby also a maximum use could be made of the ventilation at command. The two playgrounds fitted well into each other without unduly and wastefully carving up the site, and the manual instruction room and the gymnasium were suitably combined in one outstanding building. The Sixth Form was placed conveniently to the headmaster's room, and the waiting room and the porter's room were arranged close to the entrance. The scholars' common room was placed in handy proximity to the playground, and the chemical laboratory was well away from the ordinary classrooms.

The elevation was a question of wider educational considerations than the ordinary scholastic ones, and the design recommended had a dignified and pleasing elevation well worthy of the best traditions of the Preston Grammar School.

Compared with the present buildings, said Alderman Craven, the design recommended possessed the following, among other, additional accommodation:—A central hall for assembly and meeting purposes; an art room with a north aspect; a manual instruction room and a gymnasium; a kitchen and dining-room and a common room and library; a convenient section for junior boys, with separate class-rooms, playgrounds, &c.; an assistant master's room; and a waiting and porter's room.

Messrs. WOOLFALL & ECCLES's design is not one that would be easy of supervision, and the seniors' and juniors' entrances both being at the one end, might lead to confusion in the corridors at the times of assembly and dismissal. The playgrounds are good, and have the latrines in a good position, and well masked—a great advantage on such a prominent site. The elevations are picturesque in the Tudor style.

Mr. GREENWOOD adopts a type of plan in which he gets all class-rooms to the south, which necessitates a long length of corridor, but as the same is straight from end to end, supervision should not be difficult. The

Digitized by Google

position of the kitchen on the ground floor, and the dining-room on the first floor, will not enable the latter room to be readily served. The position of the manual room and the gymnasium is not good, as the junior boys will have to approach the same through the senior boys' playground.

Messrs. Packer, Drewitt & Drewitt's design is very compact, and has all class-rooms to the south. The manual instruction room adjoining the hall is not good, and would be better isolated, and also the gymnasium.

Many interesting designs were submitted, and worthy of mention were those by:—

Mr. G. H. Willoughby, Manchester; Messrs. Cheers & Smith, Blackburn; Messrs. Shaw & Vowles, Burnley; Messrs. Woodhouse, Corbet & Dean, Manchester; Messrs. Sharp & Clarke, London; Messrs. Stones & Stones, Blackburn; Messrs. Hickton & Farmer, Walsall; Messrs. F. E. & A. Milne, Glasgow; Mr. Richard Holt, Design B., Liverpool; Messrs. Leather & Wilson, Cardiff; Messrs. Shepherd & Bower, Liverpool; Messrs. J. Grundy & Son, Ulverston; Messrs. Wills & Anderson, London; Mr. F. W. Mee, Manchester; Messrs. Appleyard & Quiggin, Liverpool; Messrs. Buckland & Farmer, Birmingham; Messrs. Castle & Warren, London; Mr. J. P. Osborne, Birmingham; Messrs. Sankey & Cubbon, Manchester; Mr. C. Taylor, Oldham; Mr. P. D. Lodge, Manchester; Messrs. Honan & Beveridge, Liverpool.

ROYAL ARCHÆOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.

The report of the Council for the session 1908-9 states that upon the recommendation of the chartered accountants the accounts for the year ended December 31, 1908, are set out in a different manner and in greater detail than heretofore. In the income and expenditure account an income from all sources of 728*l.* 6*s.* is shown, and an expenditure of 724*l.* 3*s.* 1*d.*, leaving a credit balance of 4*l.* 2*s.* 11*d.*, carried to the balance sheet. Among the items of expenditure the Council desire to call attention to the sum of 200*l.*, being the James Hilton bequest, and a further sum of 175*l.* 6*s.*, both of which have been invested during the year. The investments standing in the names of the trustees are set out in the balance sheet, and on December 31, 1908, they aggregated the sum of 1,673*l.* 11*s.* 6*d.*

All charges appertaining to the year are paid.

Two members, whose subscriptions for several years have not been paid, have been amoved.

Two vacancies have occurred among the Honorary Vice-Presidents consequent on the deaths of Lieut.-Colonel Baylis, M.A., V.D., K.C., and Mr. George E. Fox, M.A., F.S.A. The Council recommend that one of these vacancies be filled by the nomination of Mr. C. E. Keyser, M.A., F.S.A., to be an Honorary Vice-President.

The senior Vice-President, Mr. W. H. St. John Hope, M.A., retires by rotation, and the Council recommend Mr. Mill Stephenson, B.A., F.S.A., to be the new Vice-President.

The members of the Council who retire by rotation under the new rule are Messrs. R. Garraway Rice, F.S.A., A. Ridley Bax, F.S.A., H. Plowman, F.S.A., General Fagan, Herbert Jones, F.S.A., and A. H. Lyell, M.A., F.S.A. Two further vacancies are created by the death of Mr. F. G. Hilton Price, Dir.S.A., and by the recommendation that Mr. C. E. Keyser be nominated an Honorary Vice-President. To fill the eight vacancies the Council recommend the names of Messrs. C. A. Bradford, F.S.A., M. S. Giuseppi, F.S.A., T. T. Greg, M.A., F.S.A., Professor F. J. Haverfield, M.A., LL.D., F.S.A., P. M. Martineau, J. H. Etherington Smith, M.A., F.S.A., W. H. Aymer Vallance, M.A., F.S.A., and W. W. Watts, F.S.A. It is also recommended that Mr. H. Plowman, F.S.A., be appointed auditor for the current year.

The loss of members during the session 1908-9 by resignation is twelve, by amoval two, and by death twelve, of whom four were life-compounders, and two libraries have ceased to subscribe. The number of new members elected during the same period is thirty-five, two of whom are life-compounders; seven new libraries have been added to the list of subscribers. The substantial increase leaves the Institute with fourteen more members and subscribers than last year, and has considerably strengthened its financial position at a time when the membership of many other societies is decreasing.

Among those who have passed away the Council regret to record the names of Lieut.-Colonel Baylis, M.A., V.D., K.C., Mr. George E. Fox, M.A., F.S.A., Mr. W. O. Roper, F.S.A., Mr. F. G. Hilton Price, Dir.S.A., Lord Egerton of Tatton, Mr. J. Parkinson, Lord Braye, the Very Rev. R. M. Blakiston, M.A., F.S.A., and the Marquess of Ripon.

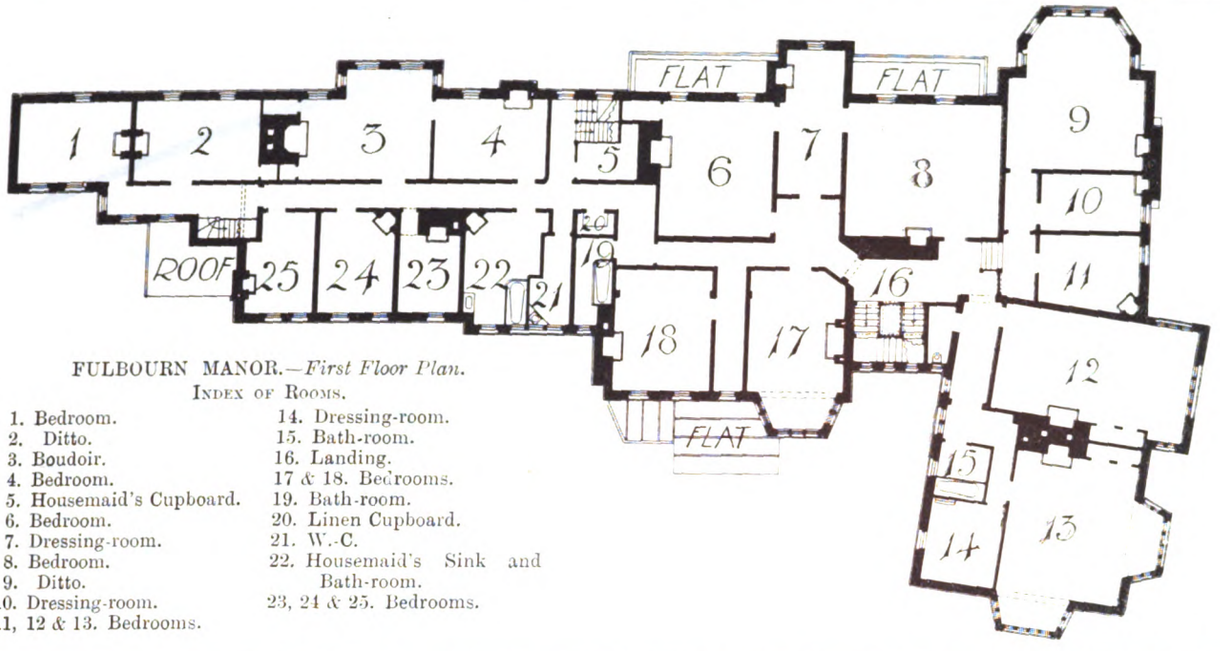
THE METHODS OF PAINTING ON STUCCO.*

(Continued from last week.)

Another large panel was carried out in the following manner. The rough rendering consisted of three of coarse Thames sand, one of blue lias lime. This is very fat in its nature and also contains a quantity of clay. This rendering was allowed to stand for four days. The second consisted of one of chalk lime putty, two of blue lias. This coat was applied a half inch thick. The last skin consisted of four of chalk lime putty, one of marble dust. A little plaster of Paris was used in all the coats with the idea that it would help to bind and set the plaster.

In the painting of this the egg and oil was used, but the hydrofluoric acid was not applied. It was varnished instead, requiring no sizing beforehand, since the medium used in the painting had stopped all suction.

For each of these experiments the lime and marble dust were both ground up together with distilled water. The plaster was well slopped to delay its drying, the whole going down together and the colour having a chance to enter the lime. In all fresco work the colours appear to bite better on slow drying plaster. Although Roman and blue lias was used in these experiments, and both stood the test well, yet Aberthol Welsh hydraulic lime is reported to be the best for the purpose. These experimental panels were subjected to the trial brought about by a constantly varying atmosphere, placed high up above hot-water pipes in a gas-lighted class-room, in which was a coke stove, the vitiated air being at times at a temperature of 100 degrees. This test they successfully resisted for twenty years, a tribute to the permanence of coloured plaster.



On so important a subject it is necessary to be critical and to arrive at practical conclusions. The medium and the marble dust together caused the painting to tend to remain on the surface. The last ingredient need not have been used; either sand or marble dust is only needed when raised work is required. After many years, upon being washed, the painted surface of the unvarnished one showed a dryness and a loss of "value" in the force of the colours. The oil, too, darkened them. However, when the work was wetted with water the colours revived, and if it then received a coat of olive oil their strength returned. The varnished one was covered with minute cracks.

It has ever been considered that to merely mix a binder with the colour, even if a fixative is passed over the finished painting, something more is needed, some process to counteract friability of surface. To harden the plaster and prevent it cracking, to enable it to resist damp and deleterious acids, a method is necessary which would be as facile under the hands of the worker as is oil painting, with no baffling difference in the colour when applied, and when in its final condition it is desirable also that the colours should have a power of penetration to sink into the ground so that both become of one substance and nature, and clarity of tone preserved so that the painting is not a mere skin on the surface.

A process has been used in which wax is mixed in the colours, incorporated with the ground, and also covering the surface of the painting. In ancient days the Greeks were in the habit of so doing. Frequently after the painting was finished they gave the entire surface a coat of wax, afterwards passing fire in a brazier in front of the face of the painting so as to incorporate the whole. Then the painted surface was burnished by rubbing a bone or ivory palette knife over it; thus was obtained a dull polish. At other times a subject painted in tempera received a coat of melted wax, which was afterwards polished by means of a piece of linen or silk. The use of heat to make the wax workable was necessary in those days. In later years a way had been arrived at of reducing the wax by means of spirit, hardening it with gum and keeping it from setting too quickly by either spike lavender, aniseed, or balsam, thus producing an excellent medium to mix with the colours. This combination has been used for a considerable number of years by decorative artists. Gambier Parry, to his honour and our

convenience, has published the best proportion of the ingredients for this medium. He has also carried out some very fine mural painting with its assistance, naming it "spirit fresco."

Perhaps the greatest experiment which has been made of late years in this process consists in the two grand lunettes, "The Arts of War" and "The Arts of Peace" in the South Kensington Museum. We are fortunate in possessing in the *Art Workers' Quarterly* a full and detailed description, written by James Ward, who assisted in carrying out the whole of the work. It is a valuable record, as it is minute and practical. Although of such interest and so serviceable as a guide, yet one feels compelled to demur at the coat of paint given to the surface of the lime in which was incorporated white lead. This would certainly not conduce either to the permanence or brilliancy of the painting afterwards applied. If it was desired to have a solid ground, why not have used zinc white?

(To be concluded.)

ARCHITECTURAL ASSOCIATION DEBATING SOCIETY.

THE fifth meeting of the session was held on Friday, November 26, when a debate took place upon "Competitions—Open *v.* Limited." Mr. K. Gammell spoke in favour of open competitions where it was a question of public buildings to be erected with public money. In such cases he contended it was morally wrong for a public body to select a limited number of architects to compete, and it was only fair to the young and unknown architects to have an opportunity of submitting a design. An open competition was the only way of obtaining the best design.

Mr. W. G. Wilson in opposing Mr. Gammell, and speaking in favour of limited competitions, said that public bodies had not only to see that they obtained the best design, but that the architect was capable of carrying it out, and in this respect a competition was useless. Further, that in the case of an open competition where there were such large numbers of designs submitted it was humanly speaking impossible to say which was really the best; the competition then becomes a gamble. He also said that to contend in open competitions was not the best way for a young architect to build up a practice.

Messrs. Hamp, R. Smith, Forster, Jacob, Ross and Bullock took part in the debate.

Mr. A. H. Belcher was in the chair, and on a show of hands he declared the voting to be in favour of "open" competitions by a majority of one.

The next meeting will be a joint meeting with the junior members of the Surveyors' Institution, and will be held at 18 Tufton Street, on Friday, December 17, when Mr. Raymond Unwin will move "That the planning of towns and estates should be designed by an architect assisted by a surveyor."

ILLUSTRATIONS.

FULBOURN MANOR, CAMBS.—GARDEN FRONT—LODGE—CARRIAGE-DRIVE FRONT—DETAIL OF FRONT DOOR AND PORCH—DINING-ROOM—BALL-ROOM—HALL—BILLIARD-ROOM INGLE—STAIRCASE—HALL FIREPLACE—FIREPLACE IN MR. TOWNLEY'S ROOM.

THE house was full of old-oak panelling which had been hidden away in cupboards, bedrooms, &c., and in nearly all cases painted. This panelling has now been restored and refixed in several of the ground-floor rooms.

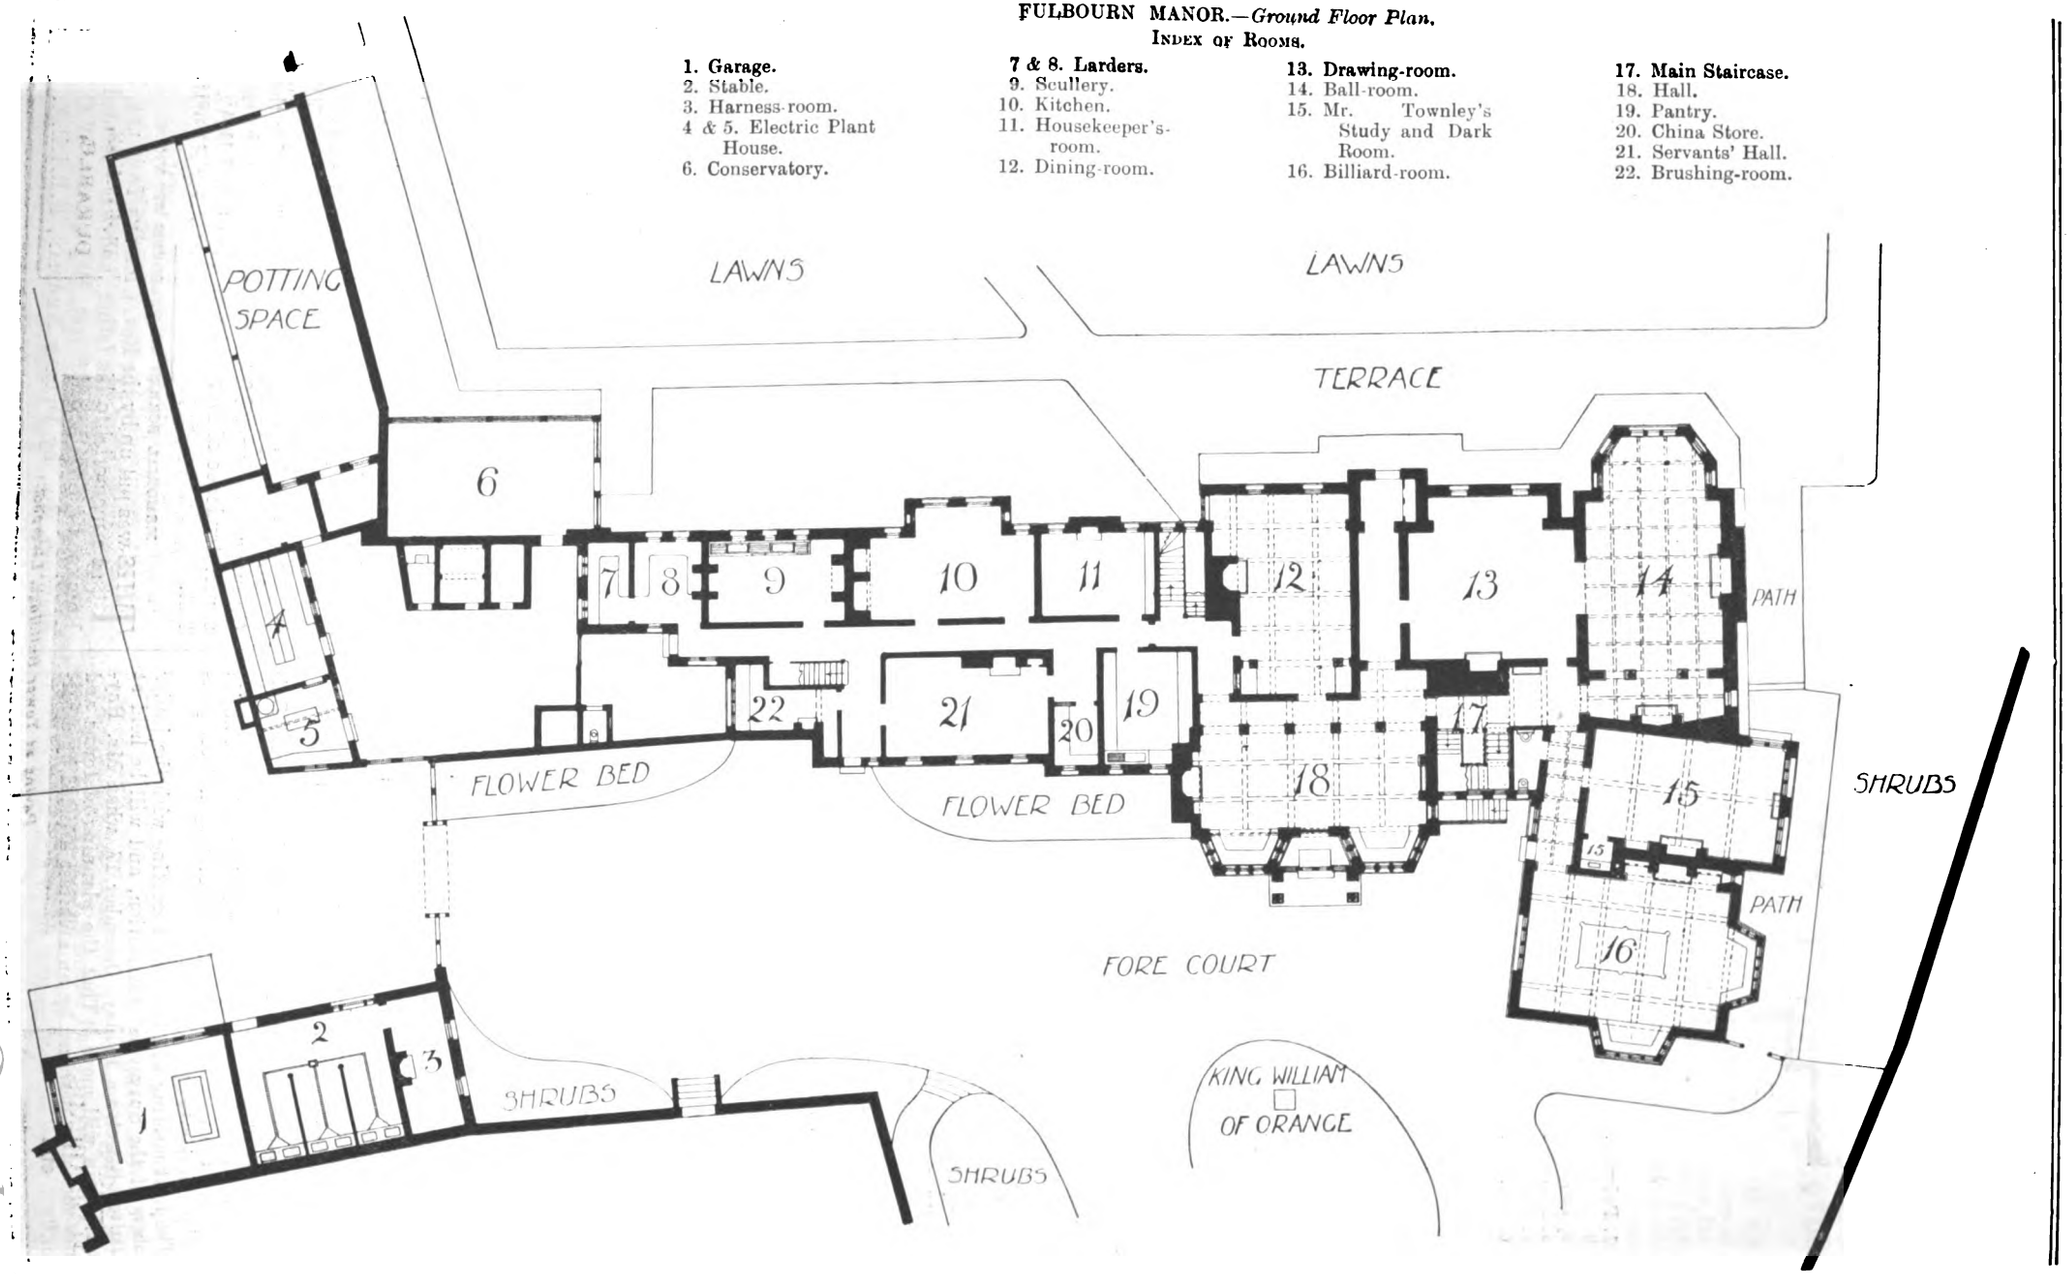
The mantelpiece in hall was found canvassed and papered over in one of the bedrooms. This same bedroom was doubly panelled, the outside panelling being painted, but the inside unpainted and carved. The ceiling of dining-room was found behind a sham plaster ceiling. The mantelpiece in dining-room was an old Jacobean bed-head found in the roof.

Nearly the whole house has been rebuilt, and as far as possible in the original style, as it was the owner's express wish that the features of the old portion should be reproduced in the new work. The windows in the hall have been filled with the coats of arms of various branches of the owner's family. A new lodge has been erected, and in the grounds there is a beautiful old Tudor manor-house, now used as a laundry. The whole of the work has been excellently carried out by Mr. JOHN A. HUNT, of Hoddesdon, all the panelling, old oak work, &c., being restored in his shops.

The electric light was done by Messrs. TAMPLIN & MAKOVSKI of Charles Street, Haymarket, S.W.; wrought-iron work, locks, &c., by BLUNT & WRAY, 49 Red Lion Street, W.C.; stone carving by DAYMOND & SON, Vauxhall Bridge Road; heraldic glazing by HORACE WILKINSON, 109 Great Russell Street, W.C.; heating apparatus, fire hydrants, by STRODE & Co., 48 Osnaburgh Street, N.W.; wood-block floor by GODDARD & SONS, Farnham, Surrey; the strong room by CHUBB & SONS, St. James's Street, S.W.; bedroom mantelpieces, stable fittings, &c., by MACINTOSH & SON, Cambridge; steel casements to lodge by W. SMITH, Balcombe Street, N.W.; lightning conductors by DIXON & CORBITT, 130 Strand, W.C.; consulting engineer, EDMUND CHARRINGTON, A.M.I.C.E., 90 Queen Street, Cheapside, E.C.

The whole of the work was carried out for the Rev. CHARLES TOWNLEY, M.A., to plans, &c., and under the superintendence of DUDLEY NEWMAN, F.R.I.B.A., architect.

MEMORIAL SCREEN IN FULBOURN ST. VIGOT.



THIS was put up by the Rev. CHARLES TOWNLEY, M.A., as a memorial to his father, and was executed by A. ROBINSON & SON, Broad Street, Bloomsbury, W.C., from drawings, &c., by DUDLEY NEWMAN, F.R.I.B.A.

RICOTE, OXON.—From a Sketch by P. HUBERT KEYS, A.R.I.B.A.

Ricote, Oxon, now a farmhouse, was at one time part of a fine mansion of the Tudor period, and once the home of the Earls of Abingdon.

THE ARCHITECTURE OF THE INCAS OF PERU.*

(Concluded from last week.)

WE shall now leave the region of Cuzco for that of Tiahuanaco, near the southern end of Lake Titicaca, about 300 miles away on the border of Bolivia. Here we find ruins which in a sense are more remarkable than those of Cuzco, because far more antique. The temples and fortresses of Cuzco date only from the beginning of the eleventh century, as stated, of the Christian era, when the Inca dynasty came to being; those of Tiahuanaco and others are of unknown age, and doubtless were built by the Aymaras at the time of their greatest culture before their overthrow. Some writers, indeed, have maintained that they were contemporaneous with Babylon or Assyria. But be that as it may, they are of a different type to that which the Inca stone-shaping art produced, and they form the ruins of the oldest city in the New World, here upon this high, bleak, sterile plateau of Titicaca, more than two miles vertically above the level of the sea.

The ruins of Tiahuanaco consist mainly of the outline of a great temple, shown by rows of upright monoliths, foundations, parts of stairways, a great stone doorway, and some colossal stone figures. It has been a question how these great monoliths were transported here, but if we take into account the hydrographic conditions of the site, which might have been formerly an island when Lake Titicaca was more extensive than even now, it is conceivable that they were floated to the spot, and possibly their quarries were nearer at hand than has been supposed. Indeed, quarry sites have been established in the neighbouring hills. But, on the other hand, some of these monoliths, both here and at Cuzco, have been transported for great distances over the most broken country imaginable, and their carriage presents the same question as has been aroused concerning the monoliths of Egypt. Near Cuzco is an enormous stone which has been abandoned on the road, and an Indian tradition says that the stone "wept tears of blood" at being left there. These great stones of Tiahuanaco, unlike the Inca walls, are often very richly carved. The most remarkable of them is the monolithic doorway of Akapana, with its carved figures, the central one of which has been taken by Peruvian archæologists to represent the mystic deity Huirakocha. Some of the lesser figures have human bodies, hands and feet; some human heads, others heads of condors; some wear crowns and carry sceptres, and they appear to be in an attitude of adoration of the central figure, which itself holds sceptres, carved with the heads of tigers and condors, which were probably symbolical of strength and power. This central figure of Huirakocha (or Varacocha) was the supreme god of the Andine people, typical of the "Abyss of the Waters," as was "Ea" among the Chaldeans. Among other notable monoliths of this group of pre-Inca ruins is a great stone image, about twice the height of a man, which stands upon the plain.

Upon the islands of Lake Titicaca there are other remarkable ruins, both Inca and pre-Inca. From this island it was that Manco Capac, the first Inca, whose virgin birth as a redeemer of man is part of the Inca mythology, set out to civilise the savage tribes of the Andes. There are many ruins on this island, as also upon that of Coati; ruined temples to the sun and the moon, the former of which the Inca worshipped as symbolical of a greater Deity. There was, indeed, much that was chaste and ethereal in the Inca religion. They imagined a Supreme Being, an "Unknown God," who pervaded everything but who could have no visible or tangible form or likeness; and they did not set up idols, nor were human sacrifices performed. The image of the Creator was represented at Cuzco by an elliptical plate of gold set on the wall of the temple. In the Titicaca region there is also a remarkable ruin, known as the "Temple of Huirakocha"—huge walls which probably were never completed; work of the Aymarans.

If now we leave this part of Peru and Bolivia and journey to the north some 700 miles—or about 400 from Cuzco—we reach the region of the Upper Marañon river, where we encounter several other beautiful examples of the Inca and pre-Inca stone-shaping art. Indeed we shall have passed other vestiges of their time upon the way, such as the monoliths of Huaitara, and ruins of prehistoric villages in many places. The modern capital of this region is the town of Huaraz, a typical Andine city, 10,000 feet above sea level, and overhung by the snowy Cordillera to the east. There are many vestiges of the Inca period here, but we shall cross the main range of the Cordillera; and one of the passes which I have traversed on various occasions is an old Inca pass of rock-hewn steps at an elevation of nearly 15,000 feet. We then descend to an affluent of the Marañon, upon which is situated the remarkable castle of Chavin. This castle, which I explored, is largely in ruins, but there are numerous singular underground chambers and passages, the purpose of whose construction it is difficult to understand. The walls are of blocks of hewn stone. But the main point of interest here is the singular carved monoliths, doubtless of pre-Inca origin, which exist or existed here. One of these, a beautifully-carved stone

* A paper read by Mr. C. R. Enock, F.R.G.S., at the last meeting of the Architectural Association.

Digitized by Google

about twice the height of a man, was transported over the Andes and down to Lima, on the coast, where it stands in the Exhibition Park. Another in the form of a column yet remains in place, and there I examined it.

The whole of this remote region of the Upper Marañon is dotted with the ruined dwellings of the former occupiers of the land. Houses, streets, fortresses, sometimes in the most inaccessible positions, upon appalling crags, towards which the night-mists from the Marañon roll up in fleecy folds like a mysterious pall, and from them these ruined castles and walls start suddenly as we behold them, like the ghosts of the dwellings of a vanished race—which indeed they are—weird and unique. I have, upon my expeditions with my men and mules, often been obliged to sleep in these ruined places, sheltering from rain and snow, and my men have cooked the evening meal in the old fireplace of perished Inca chiefs. The disposal of these numerous ruins, often about a central fortress commanding the heads of valleys, and surrounded by the abandoned "andenes" or terraced fields of these people, goes to show that the inhabitants lived as clans, or "Gentiles," and their ruined dwellings are termed by the Indians of the Andes to-day "casas de los Gentiles," or "houses of the Gentiles." These "andenes," or cultivated terraces, are a most striking feature of the Andes. I have journeyed among these interminable slopes in many places, and at sunset especially the "andenes" come into view, giving a singular rippled appearance to the sides of the profound valleys. They go to show how every available foot of ground was cultivated under the Incas, who were splendid agriculturists, and how extensive must have been the population in pre-Hispanic times of these vast regions, where since the advent of the European, only scattered villages and mouldering ruins now exist. It has been calculated that the population of the Inca Empire might have reached 90,000,000 souls, but I consider this greatly over-estimated. It is not difficult, however, to conceive a people as numerous as that of Great Britain to-day.

The most remarkable group of ruins in this region is that of Huanuco Viejo, of which I made a special study. It stands upon a broad, flat plain upon an arm of the Marañon, at an elevation of about 12,000 feet above sea-level, and consists of an extensive palace, a fortress or temple of the sun, baths, and an extensive village of streets, with a singular series of round and square dwellings, alternating in long rows. The chief architectural feature of the buildings is a series of stone doorways, really beautiful examples of Inca masonry, and the castle or temple. In the palace there are six of these doorways, all standing in a line at considerable distances apart, so that the observer who takes his stand in front of one of them is enabled to see through the whole series. The line so taken through them is about east and west. The total length across the courtyards or halls to which these doorways give access is about 400 feet. The doorways are of typical Inca tapering or trapezoidal form, with quoins and lintels of beautifully-fitted stones of the more or less polygonal form previously described, and so closely fitted that a knife-blade cannot be inserted in the joints. No mortar has been used. The lintels are monoliths of nearly 7 feet in length in some cases, and the thickness is about 3 feet, which is that of the walls of which they form part. The characteristic niches, also of trapezoidal form, are a marked feature of the walls of these ruins.

The castle, which stands in the centre of what was a huge square, around which the palace or palaces are disposed, is a building of different character. It is rectangular in form, about 100 feet wide and 170 feet long, very solidly constructed of cut stone blocks surmounted by a cornice, whose moulding is composed of a fillet and cavetto, as in the Doric order. The whole plain in the vicinity is covered with the ruins of small habitations, generally of unhewn stone. All the masonry of these ruins is composed of blocks of silicious limestone, which have been extracted from a stratified hill at the edge of the plain.

This plain and its hills, and the ruins of the palaces, castles and dwellings are absolutely uninhabited, except for an occasional Indian shepherd, and these, I was informed by my men, occasionally vary that occupation by horse-stealing. I pitched my tent under the shelter of the palace walls, and in the night a commotion among my mules seemed to suggest that some prowling robber might be about; and as a warning I lifted up a corner of the tent canvas and fired a couple of revolver shots out into the night air. When morning dawned we found tracks of sandalled feet, but nothing was missing. I sketched the chief features of the place, and rode along the abandoned streets of the Inca village, where even as late as the time of the Conquest the Incas maintained a population of 30,000 souls. Now the wild oats waved above the entablature of the palace of the Incas, and the declining rays of the sun fell softly across the ruined walls as I ascended the range of hills above the Marañon. These ruins of Huanuco Viejo are of much interest, and as far as I am aware they had never been previously examined and depicted. My photographic films had become exhausted, and I have only my sketches to illustrate them, which, however, were made with exactitude. One remarkable fact we must recollect in regard to these great stone structures of the high plateaux—they are in a region at a vast elevation above sea-level where there is little vegetation, absolutely no timber, and where corn or other cereals will not grow.

We will now leave the high region of the Sierra and descend to the coast. The principal ruins of the Incas, pre-Incas, and other semi-civilised former occupants of the land, such as the Chimus, are mainly of buildings constructed of adobe, and have remained—where they have remained at all—due to the dry climatic conditions as before mentioned. The most famous of these ruins formerly was that of Pachacamac, which at the time of the Conquest was a splendid temple raised to the "Unknown God"; and great spoil of golden vessels and plates was secured from this place by the Spaniards in the ransom of Atahualpa. The name "Pachacamac" signifies in Quechua—the language of the Andine people—"He who gives animation to the Universe." To-day nothing remains of this great temple but a mound of rubbish, a day's ride from Lima. Proceeding along the coast-zone to the south we shall reach a group of ruins known as "Incahuasi," or "the house of the Inca." These, unlike the coast ruins generally, are of stone, although they lack the beautiful workmanship of the mural remains we have visited in the Andes. But they are unique in one respect—they contain a row of columns. This is an architectural feature absolutely unknown in the Inca and pre-Inca ruins elsewhere, for, except in this case, the column was unknown to the Andine people, as was the arch. The columns of Incahuasi are not monoliths, however. The building probably dates from the fifteenth century. Still further to the south, slightly inland from the port of Pisco, we encounter an extensive group of adobe ruins in a good state of preservation, consisting of long walls with characteristic trapezoidal-formed doors and niches, and corridors, halls and rough stone foundations. I took a careful sketch of these features. The niches are still coloured with some red pigment, possibly vermilion from the great quicksilver mines in the Andes to the east, for vermilion was obtained from the cinnabar to paint the faces of Inca beauties, we are told by Garcilaso, the Inca historian.

Still further south in this coast-zone of Peru I encountered remains of long aqueducts, a line traceable for 80 miles along the hill slopes, for the Incas were expert in hydraulics and irrigation works. There are other long ruined aqueducts in other parts of the country also.

Taking our way now far to the north, we come to the region where the Chimu people flourished, who were overthrown by the Incas. They were a powerful semi-civilised coast people, and numerous ruins attest their skill in mural construction. Among these the most notable are the ruins of Chan-Chan, whose walls show florid decorations, elaborated in cement. These ruins are not far from the modern city of Trujillo, and would repay careful study.

It would be impossible within the space of this paper to dwell at greater length on the ruins of the early Peruvians I have enumerated, and those others scattered throughout the land; and I must content myself now with a few general particulars. As we have seen, the Inca and pre-Inca architecture differ much, to those who have made a study of them. The first lack any iconographic carvings, such as we have seen at Tiahuanaco and Chavin. Monoliths of considerable size were common to both; one of those at Cuzco is 27 feet long, 15 feet wide, and 12 feet high, and there are others of almost equal size. The stones vary as to their geological composition according to the region; some are of granite, as at Cuzco, some of trachyte, sandstone, or basalt, whilst others are of a hard, silicious limestone. It is to be recollected that this remarkable stone-shaping art was performed without the use of iron; but the Incas possessed bronze, termed chumpe, and copper tools. Indeed, they were skilled metallurgists in copper, gold and silver. As previously stated, the Incas were unacquainted with the arch, but nevertheless they constructed dome or "beehive" roofs, both to their tombs, at times, and to their conical houses, whether of stone or adobe. They also employed the principle of corbelling-out over openings, and to form the abutments of small bridges. In general terms the principal characteristic of the Inca architecture is its great solidity. It would seem that the builders had desired to bequeath to posterity these chapters in stone of their history;

Digitized by Google

and, indeed, it is safe to say that these may be expected to outlast any of the modern structures of America, whether the architectural work of Colonial Spain—good and solid as this is generally—or whether the evanescent skyscrapers of the Anglo-Saxon on the Northern Continent. Solid as these walls are, however, the roofs of the large buildings have perished long ago; as their builders do not appear to have been able to advance beyond sloping roofs of poles covered with grass thatch; or, at any rate, in the absence of anything else we can only assume this to have been the case. Their buildings, with small exception, are never of more than one storey. Nor were they acquainted with the use of burnt brick, although their ceramic art was an advanced one, as we know from the beautiful and abundant Inca pottery. In the shape of their vases (as well as in the form of some of their buildings) they showed a curious knowledge of acoustics. There were no doors to the houses, the openings being covered with a mat. The interiors of the temples were covered with plates of gold, of which the Spaniards secured great booty.

In conclusion, we will now cast a brief glance at the land system of the Andine people, which, in view of the present controversy in Britain regarding land tenure and small holdings, is of much interest. The land laws of the Incas were exceedingly philosophical. All the land was measured and surveyed; every available hillside was banked up and terraced, forming the "andenes" already spoken of; a portion of the land was set aside to be worked for the benefit of the sun, or let us say the Church; another portion for the Inca or the Government; whilst the bulk of it was portioned out among the people, each head of a family receiving his holding, with an added plot for each addition to his family. Everyone was obliged to work his holding, and destitution did not exist; nor was begging permitted, as every citizen was provided for and could support himself and family by his own crops and herds of llamas. Taxes were payable in goods, not money, and the whole system was a prosperous and beneficent one, under monarchs who had the welfare of their people at heart. Indeed, the organisation of land, food supply, and work, without waste or poverty, was so beneficent a one as has never existed under the rule of any Christian nation or monarch. The advent of the Europeans destroyed this promising system, and the only useful remainder which the poor dweller of the Andes inherits to-day from his Inca forbears is the system of land tenure, which is wisely perpetuated by the modern Government of Peru. That is to say, the small holding of the peasant is inalienable by law; so the Cholo of the Andes lives in undisputed possession of his little holding, wrested from rocks and thorns; but it is safe to say that he owes this security partly to its inaccessibility. Otherwise his land would doubtless have been snapped up long ago by the large landholders, after the custom of other American and European peoples. The social system of the Incas, whilst it had its excellent points in that destitution was impossible, did not tend towards social advancement, although what might have been evolved if the civilisation had not been destroyed it is impossible to say. Their social *régime* has been described as a species of Socialism, under a beneficent autocratic Government.

A few words as to the origin of the Incas and pre-Incas, and I shall have finished. I do not think anyone who has made a study of the matter will deny that the stone-shaping art and some other arts (not only of these people, but of the Mexicans, 3,000 miles away to the north) must have been inherited rather than evolved. More—the people themselves must have been immigrants originally, rather than autochthonous. But from where? The generally assigned origin is from Asia, and the Mongol cast of face is very noticeable among the pure indigenes both of Peru and Mexico. As to their arts, an origin has been assigned in Egypt and in Mesopotamia. We have seen the tendency to the pyramidal in the Inca structures, giving some atmosphere of the buildings of the Nile. A host of other analogies have been adduced. The use of copper tools, the custom of embalming the dead, for mummies are common objects in the Inca tombs; the Indian canoes of Lake Titicaca, with their turned-up prows and mat sails, which are the counterpart of such a craft figured on the tomb of Rameses II.; religious customs, including sun-worship and moon-worship; matters of design upon pottery and woven textures; the wearing of sandals; and, above all, their stone-shaping art and their transport of monoliths. Into this fascinating field it is beyond the province of this paper to trespass further. The theory of Asiatic or Egyptian origin has been strenuously denied and strenuously supported, and the approaching shores of Behring Straits, where America touches the fringe of Asia, have been pointed to as the probable path which these prehistoric immigrants followed, when, bearing in their bosom the germs of a civilisation and a religion from the ancient world, they passed down these 10,000 miles of Pacific littoral and inclement Cordillera of America. Well may we ponder on their mystery, as, standing amid the ruins of these bygone empires of the Andes, we watch the sun-god of the Incas sink in the Occident.

Mr. R. PHENE SPIERS complimented the author on the clear and distinct drawings which illustrated the paper, and which enabled them to recognise the main features of the buildings described. There seemed to have been two positions in which buildings were erected, and with different materials. Those in the lower valley constructed in adobe or sun-dried brick, and those on the highlands with stone and no timber, and the constructors did not seem to have the ordinary means of covering in a building. As regarded the origin of the people, whether they had any connection with the Babylonians or Egyptians must be left to conjecture, but he did not think the construction of their buildings was related to any particular country. Attention had been drawn to certain forms which might have been derived from Egypt, but the raking walls were a necessity of the building material. In the later works it was evident that earlier buildings had been copied, and it was quite certain that the sloping sides of the doorways could not have been derived from the structures erected with sun-dried brick, and they were probably used as the best means for getting over the difficulty of fitting too large a stone on the top. The question which occurred to him was, how did they cover their buildings? The lecturer had told them of roofs made of poles and covered with earth, but that was the fashion of to-day. He did not think it was derived from an Egyptian source any more than the beehive huts on the Irish coasts were. As regards the transport of materials M. Choisy in his books had shown them how such enormous blocks of stone were moved in Syria, but there was only slight information on the subject.

Mr. F. D. CLAPHAM seconded the vote of thanks, and said that as architects they had been most interested in the author's graphic description of the Inca buildings, constructed of masonry and with such peculiar skill that they seemed almost in accordance with the tremendous mountains surrounding them.

Mr. G. L. ELKINGTON said the impression which came to him was that the Incas and their architecture were somewhat over rated, for he could not help thinking that the examples they had seen erected under pre-Inca rule were far more interesting than the real Inca architecture.

Mr. H. W. BRITTAN also supported the vote of thanks, which was passed by acclamation.

TOWN PLANNING SYSTEMS.*

(Concluded from last week.)

THE typical irregularity of the streets of nearly all old cities is attributable to their gradual historical development, and their sometimes astonishing twists and turns may generally be ascribed to practical causes, such as the presence of an ancient way or watercourse. But it must be borne in mind that the irregularities of a plan which look so strange on paper are not necessarily disagreeable in actual execution, but often give an added interest or more picturesque effect to the street. Regularity of plan is by no means essential; St. Paul's Cathedral is on an entirely different axis to the line of Ludgate Hill, but the effect is certainly not diminished by this apparent accident of position.

With streets as well as with squares it is frequently desirable to "frame" or limit the view, and this is most generally achieved by forming a break or curve in the line of sight. The junction of Regent Street with Portland Place will serve to exemplify this, and the construction of quadrants and curved facades is another expression of this general feeling. With a strongly marked curve (such as the Quadrant in Regent Street) there may possibly be a tendency to irritation if the length is unnecessarily prolonged, but with a slightly curving frontage there is ample opportunity for a continually varying horizon, for a moving picture of continual charm. This is particularly the case where numerous objects or buildings of interest exist on the same line of route. The curved frontage of Fleet Street as one goes westwards with first the tower of St. Dunstan's Church, then the Law Courts, and the Strand churches beyond, will occur to everyone, and the noble sweep of the Thames Embankment undoubtedly owes most of its effect to the graceful curve which shows off its buildings to such splendid advantage. Imagine the difference if the river were confined between rigid walls of straight lines.

* A paper by Mr. W. R. Davidge read at the last meeting of the Surveyors' Institution.

Digitized by Google

For a tree-planted street, a slightly curved line not too regular in form gives perhaps the most pleasing effect, and for suburban streets in particular this method of planning with its continual green vistas of trees is worthy of the utmost encouragement. The most successful of the garden suburbs have in many cases been designed on such lines—a maximum of garden, a minimum of suburb. Even in this case, however, the curved streets should not be overdone. Nothing is more bewildering to a stranger than to find himself in a labyrinth of streets curving in every direction except that in which he wishes to go.

In a town street a curved or irregular line of frontage may be made to provide just the spaces for cabstands, sandbins, public ambulances, telephones, fire escapes, fire calls, and the other conveniences which are so essential to the comfort of life in a modern city. In a less crowded street the continual change of view, due to the irregular frontage, helps to break the thoroughfare up into short sections; the foot traveller feels conscious as he passes landmark after landmark on his way that he is indeed making good progress, and presses forward with encouragement, very different to the unfailing weariness produced by a mile of straight road both on mind and body.

In modern towns irregularities of planning have not perhaps always been a success; their artificial character is too apparent, and in many cases the irregularities are simply cut-away plots of triangular shape produced in connection with street "improvements," or perhaps due to the parallel shape of plots forcing the houses into *échelon* formation. The crooked street of our forefathers is perhaps too crooked for modern ideas, but it should at any rate be possible for us to grasp some of the principles which consciously or unconsciously must have guided the men of the past. With the advance of sanitation, and the increase of traffic, we demand wider streets and more breathing space, but let us not aim at showing our superior wisdom simply by the extent to which we have developed the art of drawing straight lines. Straight streets are undoubtedly necessary for many purposes; if wisely used they give an air of stateliness and a sense of fitness and monumental grandeur, but the so often reiterated use of the rectangular or draught board pattern of street planning, without consideration to the shape or contour of the ground or to any other local circumstance, cannot but be regretted.

The width and general direction of the streets having been decided upon, there will necessarily be many important centres or points of crossing at which the traffic will be much heavier than in other parts of the town. At these points the difficulties of dealing with the traffic will naturally be increased, and it may perhaps be of service briefly to scrutinise a few of the methods that have been adopted to minimise the inconvenience and danger of thus concentrating the traffic.

The rounding off of all corners produces naturally the familiar form of circus, of which so many examples are to be found in London.

The introduction of a few more converging streets produces the *rond point*, so characteristic of the stereotyped form of town plan.

A more ancient method of dealing with the difficulty is by the construction of a small open square or market place, thus dispersing the traffic over a wider area.

If the levels admit, one thoroughfare may sometimes cross the other by means of a bridge, as in the case of Holborn and Farringdon Street, or in the manner suggested by Mr. Paul Waterhouse to the Royal Institute of British Architects in 1906, in connection with the proposals of the London Traffic Commission. Sir John Wolfe Barry, too, some time ago suggested a bridge over the Strand at Wellington Street. Such methods, however, by reason of the difference of levels and cost involved can only be for exceptional cases in which the traffic is sufficiently heavy to justify the outlay.

In this connection it may be interesting to note the suggestions recently made in a Report upon the street traffic of Paris. The suggestion is not so much a constructive one as for the regulation of existing traffic, and to enable two or more streams of traffic to cross at any angle without confusion. It is suggested that at important street junctions circuses should be formed with a central island of some size, the traffic being made to circulate solely to the left, or in one direction only. Some such system of traffic regulation is at any rate worthy of a trial, and with the assistance of the London policeman should not be difficult to carry out.

Many town councils both in England and on the Continent have been far sighted enough to purchase comparatively cheap land on the outskirts of their town for the purposes of public parks, and in many continental cities this system of land purchase by the local authorities has been utilised to secure for the community itself the profit from the continual expansion and consequent rise in land values. A system of municipal land speculation of this kind has many advantages for the community, but it is naturally open to considerable opposition from private landowners.

However this may be, parks must always be provided for the public, and these should be in as easy communication as possible with the most congested portions of the town. The presence of a park in itself tends to improve the whole of the surrounding property, and naturally the better class of houses will be found in close proximity to such breathing spaces.

It is not too much to say that public gardens or tree-planted spaces are a vital necessity for the health and well-being of the community, and there can be no question that the beauty of a town is greatly enhanced by the presence of a sufficiency of trees and well-kept gardens. Ample space should also be provided for the purpose of playgrounds for the children, and these should be of a pleasant character and something more than gravel or asphalte wildernesses.

A point that is not always borne in mind in designing squares or open spaces is the proportion which the space should bear to the surrounding buildings, and particularly to the dominating building which is to abut upon it. The charm of the older cities was in hardly any case obtained by the use of large open spaces; their pleasing result was attained by a judicious grouping or arrangement of comparatively small spaces. Sitte states that in front of a building such as a church of considerable height in proportion to its breadth, in which the "vertical" note predominates, the "place" or open space should be *deep* and narrow, while in front of a long façade such as that of a town hall or other building of considerable length the open space should be *wide*, rather than deep. Experience shows, he says, that the minimum dimensions of a "place" should be equal to the height of the principal edifice fronting thereon, and that its maximum dimensions ought not to be more than double such height.

Another point which he emphasises from an artistic standpoint is the necessity, particularly in the case of squares or open spaces, for closing in or "*framing*" the view, so that the buildings appear to be continuous.

In many of the older cities it will be found that the streets and thoroughfares communicating with open squares or "places" do not run directly into the centre of the open space as in so many modern plans, but rather enter one end of it. In others the "place" is artificially enclosed by colonnading or entrance arches, to form a closed-in view.

No paper on town planning would be complete which did not touch upon the possibilities of improving the great collection of towns which we call London. The London Traffic Commission a year or so ago deliberated upon the peculiar difficulties which beset London, and with the passing of an Act dealing with the subject of town planning it is possible that some considerable alleviation may be effected in the present conditions of traffic congestion.

The first necessity is for co-ordination of effort among the many authorities in whose tender mercies the hapless Greater London is situated. Some such co-ordination should be possible under the direction of a central authority invested with sufficient powers. Given such co-operation, the next thing is evidently to take stock of our present advantages—our parks, open spaces, water-courses, commons, and country lanes and main highways, and to make all such assets as accessible and convenient as possible. Of garden suburbs we have already a few, but they need to be increased in all directions.

In parks and open spaces London is apparently well provided, but many of these are concentrated in the better-class neighbourhoods, and whole tracts of bricks and mortar still exist with hardly a tree-planted street, and only an occasional spot of green grass in the shape of a disused burial ground. In North London we have Regent's Park and Hampstead; in East London there is Victoria Park. These make a good show on the map, but they are within reach of a proportion of the people only. Meanwhile areas which might be utilised as public parks are steadily absorbed by factories and rows of mean streets, each individual owner naturally striving to make his land return as much as possible by crowding the bricks and mortar as closely as building acts will allow.

Let us consider for a moment what sort of improvements are reasonably practicable. It is comparatively easy to plan an ideal city if "ways and means" have not to be considered, but in another sense it is just the existing "ways" and "means of communication" which must be considered and utilised to the fullest extent.

Apart from the question of improving and widening many of the existing roads out of London, and of providing new routes where necessary, one of the first considerations should

Digitized by Google

undoubtedly be to bring the larger parks and as many other green open spaces as possible within easy reach of all sections of the community.

We do not make half enough of our present assets, and with expert assistance, such as can be readily given by members of our own and kindred professions, there will be innumerable fields for the beautifying of London.

The Regent's Canal is in many places one of the most beautiful of London's ways, but it means little, if anything, to the thousands of Londoners who catch but a glimpse of it from the top of an omnibus over the parapet of a high-walled brick bridge, or through the chinks of an advertisement hoarding. What a glorious series of shady walks might be made by its banks with a little thought, a little sacrifice.

Very few great cities are more finely situated by nature than London, if we could but realise it. Both on the north and south it is girdled by hills, and the broad expanse of heath at Hampstead and the hills of Sydenham and Forest Hill are splendid fringes for a splendid city.

On the east and west we have already an almost continuous chain of truly beautiful parks, and yet the main roads lined closely on each side by houses in many cases thread their way through the closely built area between the parks, almost within reach, yet entirely out of touch with the green grass and green fields. Nine-tenths of the passengers on tram, or bus, or tube are entirely oblivious of the parks so near at hand, and, although they may perform the same journey day after day for years, have neither the time nor the inclination to go a hundred yards to see the parks so thoughtfully provided by an earlier generation. The remedy is clearly to open out all such parks so that they can be appreciated and utilised to the fullest possible extent.

London has also been fortunate in the past in taking advantage of the little hills and valleys which exist in her very midst. St. Paul's owes much of its effect to the height of Ludgate Hill on which it stands; the Valley of the Fleet, Notting Hill, and other natural beauties within the area of buildings will occur to everyone. One and all emphasize the necessity of taking the fullest advantage of every rise and fall of the ground.

No planning, however, can hope to be of real service in beautifying our cities unless the architecture of the buildings is in accord with its needs and worthy of its purpose. Some efficient architectural control there must be, but at the same time it is evident that in England at any rate as free a hand as possible should be given to individual tastes. With our present methods this may appear well-nigh impossible, but with a better and more general appreciation of the art of building it would not be an impossible idea to reconcile these conflicting schools.

Although perhaps in the central and more important areas it may be necessary to require buildings to be to a strictly regulated and restrained design, in the outskirts there is no reason why much more latitude should not be allowed for individual ideals. The garden suburbs, which have been formed in various places around our great cities, are many of them delightful in their planning and surroundings. Port Sunlight near Birkenhead, Bourneville and Harborne near Birmingham, the Hampstead Garden Suburb, and many other model estates in the neighbourhood of London, all testify to the advantage of such suburbs, combining as they do the beauty of the country and the facilities of the town.

The Bill now before Parliament provides for the town planning scheme to be prepared by the local authority, such scheme, when approved by the Local Government Board, to have effect as if it were enacted in the Act.

The preparation of such a town plan will in the ordinary course of events be the work of a committee or commission appointed by the local authority or authorities concerned, and it is to be hoped that they will have the advantage of skilled expert advice. It may be interesting to compare this with the practice that obtains in German towns under the magisterial system.

The Mayor or Oberburgermeister is under this system elected for a long period of about twelve years, and he is assisted in his functions as head of the executive by a Cabinet of a select number of special councillors, also elected for a term of years. Practically the whole of the town government is in the hands of this paid Cabinet or "Magistrat," and they have the advantage of expert advice from the city architect, engineer and medical officer. In the preparation of town plans it is also customary to consult one or other of the leading professional men of the country, who have built up reputations as specialists in this class of work.

In England it is evident that the preparation of a scheme so vitally affecting the future of a town must not be left entirely to a committee composed of butchers and bakers, however well meaning, or of property owners or others who have their own axes to grind. The best advice obtainable must be secured and this will no doubt be readily and cheerfully given by surveyors, architects, valuers and all concerned with the material advancement of the town. The further submission of the completed scheme to the Local Government Board will ensure that a fair hearing is given to all objections raised and that the proposal is as free as possible from objectionable features. Whether it will also ensure that the scheme shall contain a sufficiency of sites for public buildings, gardens, parks, open spaces and similar amenities remains to be seen.

The acquirement of property required for these purposes and the compensation to be paid in a general scheme for redistribution of land would in themselves form ample material for an interesting treatise, and I do not propose to go into these questions which are somewhat outside the scope of my Paper.

Mr. LESLIE R. VIGERS moved a vote of thanks to Mr. Davidge for his paper. He said the general tendency of legislation relating to building was nowadays too much centred in Government Departments and borough councils. They suffered from what he termed a two-foot rule of the Building Acts, and were quite in the hands of the Local Government Board officials and without any chance of appeal to an authority outside. There was, of course, the appeal to the Tribunal of Appeal, composed of men who were in practice and able to bring independent minds to bear upon the subjects put before them, but he maintained there was too much of the two-foot rule interpretation of the Acts and he was afraid that in future years there would be trouble when they had to re-arrange their suburban towns.

Mr. HENRY LOVEGROVE seconded the motion and referred to the inclination of the present day to take people away from the centre of London. Such schemes were all very well from one point of view, but the trading interests in the centre suffered.

The PRESIDENT, in putting the vote of thanks to the meeting, said it was felt by the Council that as another paper on the Housing and Town Planning Bill was to be read before the Institution on January 10 next, it would be well to adjourn the discussion of that evening's lecture and take the discussion of the two papers together on January 24.

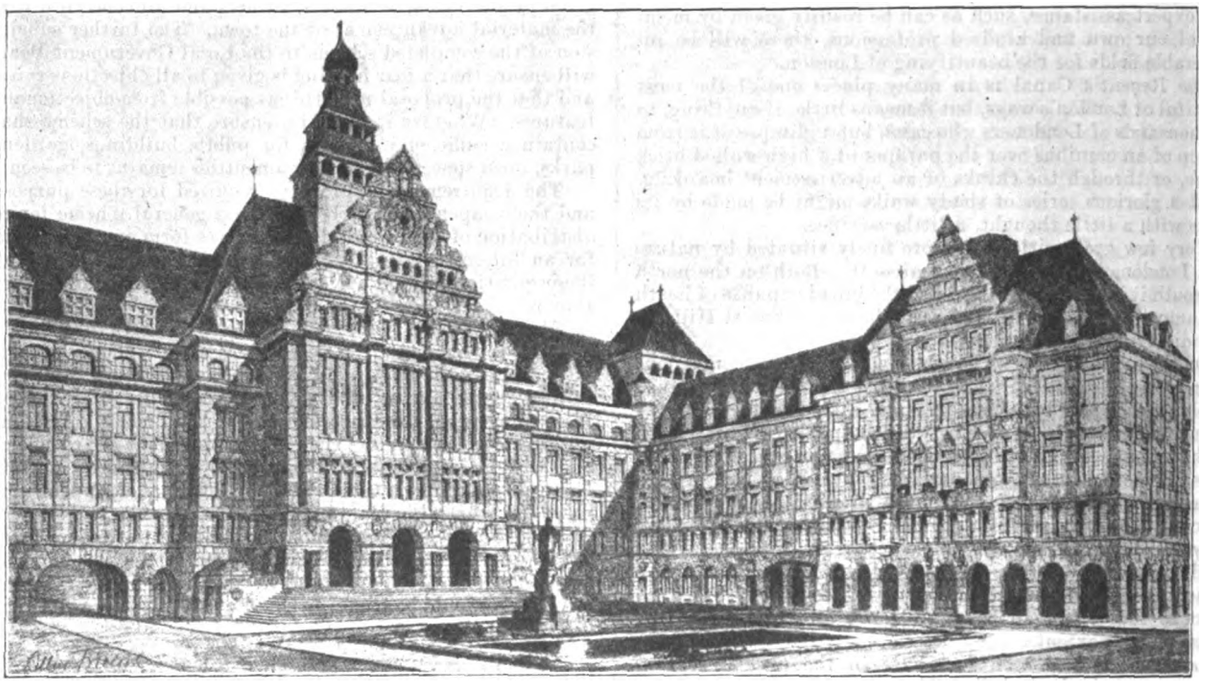
Mr. WM. WOODWARD formally proposed the adjournment of the discussion until January 24, and the motion was unanimously adopted.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE third general meeting of the Society was held at the Rooms, Park Street, Leeds, on Thursday evening, November 25, when, after the usual preliminaries, the President, Mr. Percy Robinson, F.R.I.B.A., called upon Mr. Martin Shaw Briggs, A.R.I.B.A., to deliver his lecture on "An Unknown Italian City."

Mr. Briggs, who has been recently appointed an Extension Lecturer to Oxford University, thereupon introduced his "unknown city" as Lecce, the capital of the "heel" of Italy. This district, it would appear, although perfectly situated as regards railway service, has been completely neglected by tourists hitherto, and it was only by chance that the lecturer was invited by the editor of the *Architectural Review*, to visit Lecce in the spring of 1907, and to write for him a series of illustrated articles on its reputedly interesting buildings.

So much material, interesting both from architectural and historical points of view had Mr. Briggs found, that he decided to write a more extensive monograph, to be profusely illustrated, on the city and district, and to appeal to the general public under the title of "In the Heel of Italy." From the chapter of this book dealing with architecture, the lecturer drew the substance of his paper.



Carefully tracing the historical causes, he pointed out the influences at work in Italy and particularly in Southern Italy, contributing to produce a remarkable architectural period in this remote city, at a time almost synchronising with the career of Sir Christopher Wren.

He discussed the suitability of the term "baroque," as applied to the building of this period; compared its characteristics in Lecce and better-known cities, pointed out its strong points and its more obvious defects, and urged the rare charm of a complete baroque city.

Early examples of the middle of the sixteenth century varied in Lecce from a comparatively pedantic style to an extravagance of grotesqueness, far from pleasing, but in the later period a more settled style became noticeable and it is

GERMANY.

DESIGN FOR RATHAUS AT BARMEN.—Albert Froelich, Architect. [From *Berliner Architekturwelt.*

this epoch to which Lecce owes the majority of its buildings. The details of this phase of architecture were noticed and some account given from contemporary writers, illustrating life in Lecce during the early eighteenth century.

Mr. Briggs remarked in conclusion that he regretted having to limit himself to architectural matters that evening, as he had found so much of interest in the history and in the people of this remarkable city and district. He commented upon the fact that although a place of considerable importance and within easy reach of Brindisi, the inhabitants regarded an Englishman with great curiosity, and amused his audience by confessing to having been arrested near Lecce as an Austrian spy.

The lecture was illustrated by some thirty lantern slides, mostly of architectural subjects, of which the greater number were prepared from the lecturer's own pen and ink drawings, many of them being of beautiful little palaces and street views so characteristic of this city.

At the close a cordial vote of thanks was, on the motion of Mr. W. H. Thorp, F.R.I.B.A., seconded by Mr. A. E. Kirk, A.R.I.B.A., accorded to Mr. Briggs. In proposing, Mr. Thorp remarked on the tendency of much of the work now being carried out in Rome to follow on the lines of the later baroque, while Mr. S. D. Kitson, F.R.I.B.A., accredited the lecturer with having entered a strong plea for this much maligned style, a sentiment which was approved by the majority of those present.

THE PRESENT ASPECT OF ELECTRIC LIGHTING.*

WHEN we wrote our paper on "Electricity Supply and Metallic Filament Lamps," which was read before the Institution in April 1908, the wire lamp had but recently appeared on the horizon, and there was general uncertainty as to what was likely to be its effect on the electric lighting industry.

At that time the 200-volt wire lamp was non-existent—indeed, one authority in a subsequent paper spoke of it as highly improbable, if not impossible—the smallest tungsten filament lamp obtainable for 100 volts was 25 c.p., the list price being 4*s.*, and but few people had resorted to the expedient of putting in a transformer to reduce the voltage to 25, which was the highest voltage on which a 10-c.p. lamp could be used.

* Abstract of a paper read before the Institution of Electrical Engineers, by Mr. H. W. Handcock and Mr. A. H. Dykes, members.

Two years have elapsed since the paper was written, and it occurs to us that it may be of interest to members to review the position to-day to see what the actual effects of the introduction of wire lamps have so far been, whether the fears expressed by some have been justified, and whether new factors are being introduced which may tend still further to modify the previous condition of affairs.

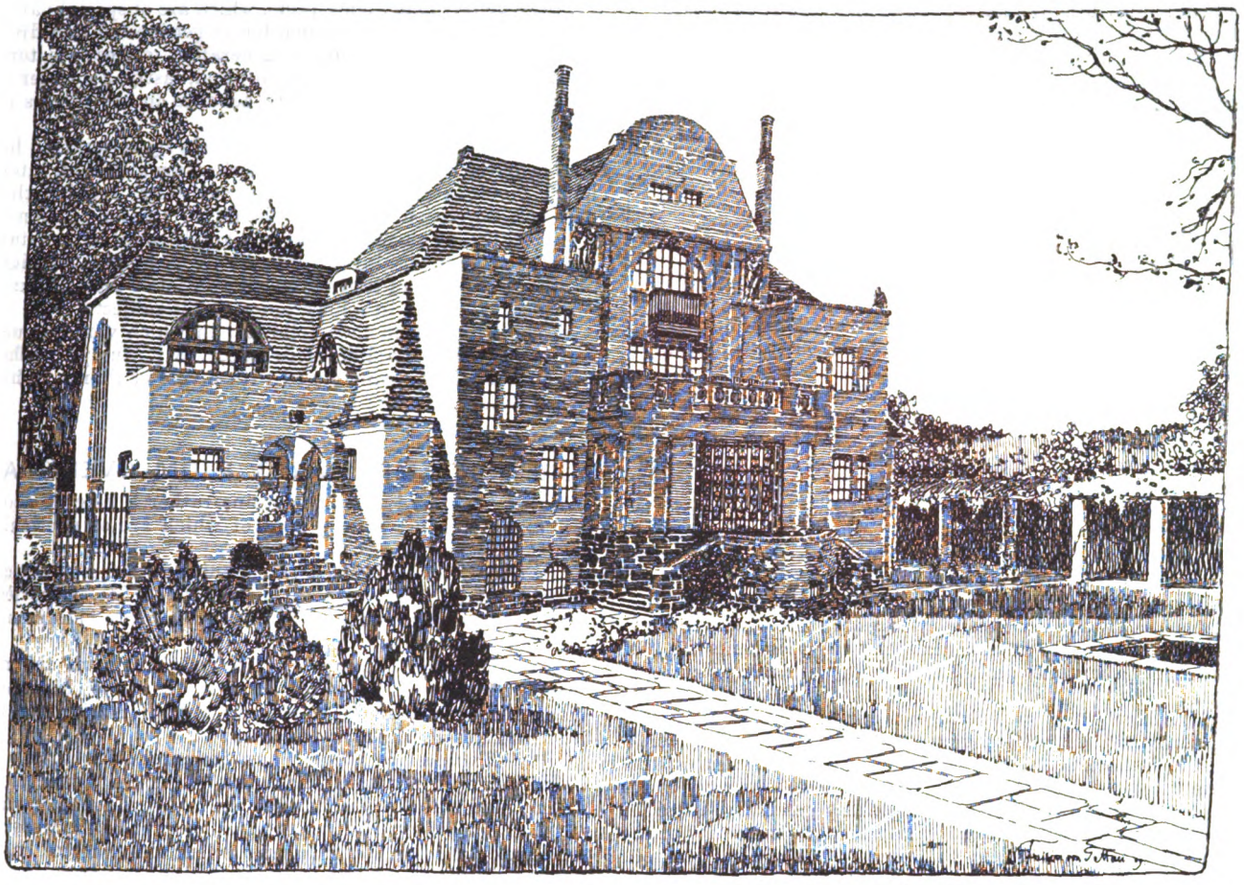
The first thing that strikes one is the extraordinary progress made by the lamp makers in the interval.

The manufacturing difficulties which led to blackening and premature failure have been almost entirely overcome, the methods of attachment and of supporting the filaments have been improved, and, apart from mechanical damage, the useful life of the lamps has now been proved to be, on an average, about double that of carbon filament lamps.

Two years ago the best that a consumer on a 100-volt circuit could do was to replace an 8-c.p. 33-watt carbon lamp with a 25-c.p. wire lamp, taking about the same amount of energy and costing 4*s.* each.

To-day he can, if he wishes, replace the 8-c.p. 33-watt carbon lamp by a 14-c.p. wire lamp, taking only half the energy and costing 2*s.* 9*d.*

So far continuous-current stations supplying at 200 volts have not been much affected, but at least one well-known maker has now succeeded in producing a 16-c.p. 24-watt lamp for 200 volts, which we are informed will be on the market very shortly at the price of 5*s.* We have had some of these lamps in actual use for some months past, with very satisfactory results. When it is stated that the diameter of the filament is only $\frac{1}{2500}$th of an inch and its length nearly 40 inches, one cannot fail to be struck by the skill of the lamp makers. Even this does not represent the limit, as we have seen in operation a 10-c.p. 200-volt lamp taking only 15 watts.



Past experience suggests that the price will before long be reduced, when there will be nothing to prevent consumers on direct-current 200-volt systems from following the example set them by those on alternating-current systems and obtaining the same candle-power as with carbon filament lamps, but with a consumption of less than one-half of the energy.

It is evident that whatever has been the effect of the wire lamp on supply stations during the last two years, it will be greatly intensified in the near future.

In our 1908 paper we ventured to suggest that the effect on those stations relying on a purely lighting load—and there are still a very large number of them—would be disastrous unless some steps were taken to alter the method of charging. We suggested that a fixed charge should be made, based on

AN ARCHITECT'S HOUSE AT LANKWITZ.—WILHELM BARON VON TETTAU, Architect.

the maximum rate of supply contracted for by the consumer, which we termed his contract demand, and in addition a small charge per unit to cover the running costs.

It appeared to us that although the increased cheapness of the light, due to the new lamp, would attract new consumers, their numbers would not be sufficient to counteract the reduced demand of the original consumers, nor would the amount they individually contributed on a flat-rate basis be sufficient to cover adequately the cost of additional services and incidental standing charges.

The results of the past two years have only served to strengthen us in our belief that the flat-rate system fails to meet the conditions that now obtain, and that only by the adoption of some system which secures to the undertaking a definite minimum return from each consumer, based on the rate at which he contracts to take energy, can purely lighting stations be profitably run.

Experience has shown that on the average consumers have reduced their consumption even where they have somewhat increased their illumination, and the revenue received by the station per lamp connected has consequently fallen very considerably.

We assume that in most cases a 25-c.p. 30-watt metallic filament lamp will satisfactorily replace an ordinary gas burner such as is normally in use. It is true that with a photometer a mantle when new will, under certain conditions, show possibly 60 c.p.; nevertheless, experience shows that with few exceptions the average man is quite satisfied with the 25-c.p. metallic filament lamp for indoor domestic purposes.

The cost of lighting is judged by the everyday user not by the nominal candle-power of the illuminant, but by the total cost of obtaining a satisfactory effect in a room. If, for instance, a 25-c.p. lamp lights a room adequately for a given sum per annum, a consumer would not thank you for saying to him, "I cannot give you a steady 25-c.p. lamp for that sum, but for a somewhat higher figure I will give you a gas lamp fluctuating from 60 c.p. downwards."

For domestic purposes the 25-c.p. electric lamp is a satisfactory unit of illumination, and if it is more economical than the so-called 60-c.p. gas-light the consumer will take it. Given a proper method of charging, we are of opinion that not only can this be done, but in such a way as to prove very remunerative to the electric light undertaking.

With the flat-rate system of charging, the long-hour consumer at present uses gas. One reason for this is that owing to the loss made by the electric light undertaking on the short-hour consumer it is necessary to keep up the price all round, and the competitive illuminant benefits.

One frequently speaks as though it were an absolute necessity to supply every consumer in an area, regardless of whether he be profitable or not. In our opinion the very short-hour consumer, from the nature of the problem, can never be a remunerative one to an electric light undertaking on the present flat rates, as the capital outlay to supply him is very nearly the same as for a long-hour consumer.

Let, therefore, such a consumer go if he will not pay his fair contribution to the cost of supplying him; let him use gas or candles, and let us concentrate our efforts on the long-hour man, who gives us a greater number of working hours over which to earn interest on our capital.

At the moment it is generally the other way round, and electricity is given the unremunerative short-hour lamps because the present tariffs make the cost of long-hour lamps too high.

Under an equitable tariff the cost of short-hour lamps to the consumer might possibly be increased, but long-hour ones would be greatly reduced. This might perhaps result in the loss of some consumers who at present do not pay their proper contribution, but would be no detriment to the undertaking, which could then utilise the plant thus freed in supplying the great influx of long-hour gas consumers, who would be attracted on the score of economy, apart from any other advantages.

The difference in cost is so little and the business advantages, from the point of view both of the station and the consumer, of a fixed charge are so great, that we consider it preferable to make a fixed charge per lamp per annum,

Digitized by Google

irrespective of the number of hours during which the lamps are used.

It obviously does not pay to go to the expense of putting in a meter, providing a staff to read it and keep it in repair, and a staff of clerks to make out the accounts, in order to check such small variations in revenue, more particularly if the relative importance of the standing charges be still further increased by the station supplying the interior wiring.

(To be concluded.)

THE CONCRETE INSTITUTE.

A MEETING of the Concrete Institute was held on Thursday of last week at the United Service Institution for the purpose of hearing a paper by Mr. R. L. Humphrey, of Philadelphia, U.S.A., on "Some Points Relating to Reinforced Concrete as Applied in the United States." The chairman, in his opening remarks, said that their membership was now 855.

Mr. Humphrey, having mislaid the bag containing the manuscript of his lecture, was only able to treat his subject in a general way, but a large number of slides were thrown on the screen. He said that in the course of his work he had visited nearly all parts of America and Canada, and during the last few months he had been to the principal cities of the Continent. The more he saw, the more convinced he became of the great future that awaited concrete. As a material it was, of course, hundreds of years old, but the concrete that was produced to-day was superior in every way to that of the Romans. It was only necessary to watch the production of Portland cement to realise that the improvements in the process of production go hand in hand with the wider uses of it.

Mr. Humphrey said that, comparing Europe with the United States, he had been much struck by the fact that while over here there was in the aggregate a great amount of concrete used, yet there was by no means the same variety in its applications as in the States. Speaking generally, it might be said that its scope was only limited by the ingenuity of the constructor. A great deal still remained to be finally agreed upon in connection with it. There was need for a more intimate knowledge of such important matters as the working stresses, the behaviour of concrete under stated loads, how the reinforcement should be introduced and of what character it should be, the durability of the material and its ability to withstand corrosion, and so on. These and other questions offered a wide field for investigation. Even so simple and elementary a matter as the mixing of the concrete was the subject of most opposing views. It might be said, therefore, that one of the leading functions of such a society as the Concrete Institute was that of an educational body. It was nothing short of marvellous that despite such radical differences of treatment the material had been employed with such almost invariably good results.

It was noteworthy that the problems that vexed them in America, and which were the fruit of doing things rapidly, were just as apparent in Europe, where things were done much more slowly. The one important thing for which all concrete users should strive was standardisation, whereby all that was known about it could be crystallised and taken advantage of by all, thus saving a vast amount of useless and unnecessary work.

One of the greatest obstacles in the path of its full development was the lack of preparatory education possessed by the average architect concerning the material. Architects were as yet unable to think in concrete; they had been brought up in an atmosphere of stone, brick, terra cotta, and other time-honoured materials. When they employed concrete they were called upon to use a passive material that does not lend itself to the customary rules of design. It was scarcely yet realised that concrete was one of the finest materials for construction, or that it could be moulded by the architect to suit his will. One of the things, however, that had struck him most during his visit to Europe was the much more artistic manner in which it was employed than was to be seen in America. Indeed, he would return there with the conviction that there was an even greater future than he had before credited awaiting the material.

A succession of coloured and other slides showing American examples were then shown upon the screen, in connection with each of which Mr. Humphrey made interesting comments as to the particular application of concrete. The series opened with a small foot-bridge erected at a time when the material was generally distrusted; the progress of the material was then traced through successive stages. The views included subways for foot and railway traffic; railway sleepers, with the rails resting on wooden cushions to minimise the concussion; cement pipes; canal banks in connection with great irrigation works; water tanks; cold stores; docks; concrete piles 60 feet long; fence posts, which are of special value alongside railroads where wooden fences get ignited in a fire; cowsheds and farm buildings generally; stores; factory chimneys; grain silos; street paving; and, lastly, a number of residences which showed a steady advance in the powers of design.

Mr. Humphrey wound up his remarks by reiterating his belief as to the importance of standardisation and of an interchange of views among the various countries, arguing that there was no reason why there should be greater differences of method among them all than in a single country. A start might be made in obtaining common agreement as to the right and the wrong way of testing cement. A lot of deep thinking remained to be done in connection with the subject.

A short discussion then followed, in which various questions suggested by the slides were asked. Mr. Humphrey then replied, and the meeting closed with a vote of thanks to him for his lecture.

OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* contains rather a heterogeneous series of illustrations, none of which are of particular beauty.

La Construction Moderne, continuing its series of articles on Old Paris, now deals with the hill of Ste. Geneviève. Further illustrations are given of the post-office buildings on the Cité Martignac.

Deutsche Bauzeitung describes and illustrates the new Town Theatre at Hildesheim, of which Professor Max Littmann is the architect. The account, with illustrations of the new Rathaus at Rixdorf, is continued.

The Engineering Digest has an interesting article on "Mahogany," telling us how and where the timber is obtained, and other facts connected with its production and use.

The Scientific American has an account of the treasures of Greek art recovered from an ancient ship wrecked on the coast of Tunisia and now being housed in the Bardo Museum at Tunis.

GENERAL.

The Founders' Company, one of the ancient City guilds, is arranging once more to hold an exhibition (which will be opened by the Lord and Lady Mayoress) in London on June 7 and 8 next year of castings and models in metals—viz. aluminium, bronze, brass, gold, iron and silver, also of designs in wood, plaster, and any other suitable material for casting to be competed for by founders, designers, craftsmen, apprentices and improvers, British-born subjects engaged in foundry business or its allied trades. Monetary prizes as well as certificates and medals will be awarded.

The President and Council of the Royal Academy of Arts announce that on the 14th inst. they will elect a Turner annuitant and a Redgrave annuitant. Applicants for the Turner annuity, which is of the value of 50*l.*, must be artists of repute in need of aid through the unavoidable failure of professional employment or other causes. Applicants for the Redgrave annuity, which is of the value of 35*l.*, must be painters in oil or water-colours, who shall have been exhibitors at the Royal Academy, and be in want of pecuniary aid from age or sickness. Forms of application must be filled in and returned on or before December 10.

The Royal Sanitary Institute will hold their annual Congress and Health Exhibition in the Royal Pavilion, Dome and Corn Exchange, Brighton, from September 5 to September 14, 1910. Intending exhibitors should obtain full particulars at the Parkes Museum, 90 Buckingham Palace Road, S.W.

The Local Government Records and museums committee of the London County Council report that during the excavations in connection with the construction of the Hackney Wick relief sewer extensions a very interesting discovery of prehistoric remains has been made. The remains consist of bones which have been identified as belonging to the mammoth and an extinct form of rhinoceros. They were found along the line of the sewer between the Great Eastern Railway (Chingford branch) and Roding Road, Homerton, at varying depths in the gravel overlaying the blue clay. In view of the nature of the discovery, a brief statement on the subject is to be prepared with a view to its being sent to public elementary schools in the district.

Wednesday, December 14.

Conference on Housing and Town Planning Bill at the Westminster Palace Hotel at 10 A.M., arranged by the National Housing and Town Planning Council. To be continued on Thursday.

Thursday, December 15.

Junior Institution of Engineers: Paper on "The Design and Maintenance of Cement Works," by Mr. H. Horsburgh.

THE SCULPTURES OF CHARTRES CATHEDRAL.

AS a museum of the best that French sculpture allied with architecture has given us from the twelfth to the eighteenth century, there are few buildings that will vie with the cathedral of Chartres. To the student of iconography also this cathedral is a mine of wealth, and hence we welcome an excellent collection of photographs,* the aim of which is, in the words of the authors, "to illustrate the cathedral on a scale hitherto unattempted." The prosecution of this aim has given us a fairly complete presentment of the sculptures of the west, north, and south portals, with some examples of typical sculptures and treatments of the buttresses of the cathedral, and some illustrations of the later work from the sixteenth to the eighteenth century of the choir screen.

The authors tell us that "the illustrations being the end and object of the book, the text only aims at elucidating them, explaining the subjects as far as they are known and giving their symbolic interpretation, with reference to the most recent and authoritative writers." This may be a modest way of expressing the authors' aim, but the manner in which they have accomplished that aim by their careful selection from the work of those who have written exhaustively on the sculptures of Chartres renders their work a valuable text-book for the primary study of mediæval iconography and architectural sculpture.

As VIOLLET-LE-DUC points out, architectural sculpture is commonly held to embrace two distinct branches: statuary and the sculpture of ornament, or, as we generally nowadays should call them, sculpture and carving. Chartres teaches us the lesson that the distinction is a false one, and that if works of sculpture are to be indeed part of the building and not mere exotic additions from a studio, the distinction between sculpture and carving must no longer be maintained, but both must become part of the architecture.

There is all the difference in the world between an alliance of architecture and sculpture in which the former provides a frame that the latter fills, even if it be filled adequately and sympathetically, and the union—one might say fusion—of architecture and sculpture as seen in the portals of the cathedral of Chartres.

Nowhere in the history of art has this union been more completely exemplified than in the buildings of the twelfth and thirteenth centuries of Western Europe, and amongst these buildings the foremost place is taken by Chartres for the essentially architectonic character of its sculpture.

The twelfth and thirteenth century work at Chartres has sometimes been compared with and placed beside the Greek productions of the days of PERICLES, but admirable as is the sympathy and harmony of the sculptures of PHEIDIAS with the architecture of ICTINUS, one must always feel that the tympana, the friezes and the metopes of the Parthenon are the frames in which plastic pictures are set. It is not so at Chartres; there the sculpture is not part of the architecture or an added ornament, but it is the architecture.

That the architectonic character of the figure treatment at Chartres was intentional and not accidental is, we think, sufficiently manifest. Though the treatment of the drapery of the figures on the west portal has much in common with Byzantine work, and they may even be said to be, in the words of VIOLLET-LE-DUC, "profondément pénétrées de la tradition Byzantine comme faire," the fact that the habiliments of the figures are distinctly those of the time, and the features are manifestly portraits, is sufficient to prove that the artists were capable of a different treatment of the pose and lines of drapery had they not been convinced that the quasi-Byzantine mode was that which best accorded with the spirit of their architecture and rendered their sculpture so essentially part of the building.

It is well to note that architectonic character of figure sculpture does not connote a conventional or even ideal type of face, for although the figures of the thirteenth century work in the north and south porches have this peculiarity, those of the earlier work in the west portal are, as we have said, manifestly portraits, yet the sculpture of this portal is as essentially architectonic as that of the later work. The conventional treatment of pose and drapery is sufficient in itself to give the desired character. On the other hand, it is not necessary that the drapery treatment should follow the Byzantine manner, for that of the north and south porches has progressed beyond the limitations of the twelfth century and yet has not lost the architectonic character.

That there should be no hard line of demarcation between sculpture and carving is a lesson taught by the beautifully-wrought small shafts of the west portal of Chartres, and this not merely because they combine figurework with conventionally treated foliage, but because one cannot conceive that the unity of the whole composition was possible with any separation of the craftsmen who executed such work into two distinct trades or arts of the sculptor and the carver. Nor do we find the distinction introduced in the later work of the north and south porches. One cannot, even if one

* *The Sculptures of Chartres Cathedral.* Text in English and French. By Margaret and Ernest Marriage. (Cambridge: At the University Press. 12*s.* net.)

Digitized by Google

would, say where the work of the carver stopped and that of the sculptor commenced. Such distinction is only possible whilst the carver is a man set to reproduce with more or less fidelity the stock patterns of architectural ornament handed down from the work of the past, and the sculptor is an artist who is commissioned to fill a frame provided for him by the architect. Such an arrangement may lead to an alliance between sculpture and architecture: it can never bring about their union as exemplified in the cathedral of Chartres.

In the work of one of the greatest, if not the greatest, of our modern sculptors, ALFRED GILBERT, we see the abolition of the distinction between sculpture and carving. GILBERT'S figures are not framed by carving; the non-figure work is as much a part of his composition as the figures themselves, and so it is with the sculpture of Chartres.

Another notable feature of the cathedral of Chartres is the didactic character of its sculpture. Mr. FRANCIS BOND in his monograph on Westminster Abbey has laid it down that "the fact is—and unless it is grasped it is impossible to understand Westminster or any of the greater churches here or abroad—they were built not for man, but for GOD; and they were built for quiremen and not for the general public." The truth of this assertion it is impossible to admit when we stand in front of the portals of Chartres, and note the excellence and completeness with which the iconographic scheme teaches the fundamental doctrines of Christianity as then promulgated, the lessons of sacred history both of the Old and the New Testaments, of the examples of Saints and Martyrs, of the moral virtues and vices of everyday life. Were all these lessons set out so forcibly for the glory of GOD or the enhancement of architectural beauty and not for the instruction and admonition of the laity? Were they not rather intended for a perpetual reiteration visible to all of the teaching that was one of the functions of the Church within?

Even though at the present day the use of iconography as a method of instruction has so far declined that it is not always clear to us who are the persons intended to be represented, and such authorities as the Abbé BULTEAU, MALE and VOGE disagree in their interpretation, we cannot doubt that in the twelfth and thirteenth centuries their significance was well understood and was often the text of the sermons preached within the cathedral.

In their presentment of the iconography of Chartres the authors have not hesitated to take their photographs from unusual points of view, and even with distortion of the architectural lines, as the purist in photography might aver, so long as the object of their plates was attained—the illustration of the sculptures of Chartres Cathedral. They have also, as they tell us, made full use of the properties of the telephotographic lens, without which, indeed, such completeness and clearness of their study of the sculpture as we have before us would have been impossible.

We are glad to note that the authors call attention to the traces of colour that even now are still to be seen on the sculptures of the west front. It is one more piece of evidence of the far wider use of colour in architecture than most people of the present day seem able to realise as having been general in mediæval times. Here once more we find a bond of similarity between the two finest examples the world has seen of the conjunction of sculpture and architecture, the Parthenon of Athens and the Cathedral of Chartres.

NOTES AND COMMENTS.

THE libel action by which Mr. SIDNEY R. J. SMITH, F.R.I.B.A., has vindicated his character is peculiarly instructive. It shows on the one hand how more often than not the too prevalent idea that exists amongst some of the British public is fostered, that architects do not depend on their 5 per cent. for a living, but get something more out of the builder or manufacturers of special goods. Mr. SMITH'S detractor shot his bolt and ran away. He was not prepared to substantiate in court the charge he had made, and therefore it must be assumed that the accusation was false and without foundation, and the jury were evidently of this opinion in framing their verdict. It is a sad thing that an architect holding the position of Mr. SIDNEY SMITH should feel it necessary to bring an action for libel against a man of straw in order to vindicate his character, well knowing that whatever damages the jury might award him, he would not get a penny of them, but would certainly have to pay his own costs. It is undoubtedly the fact that there are people who believe that architects do follow the practice of which Mr. SIDNEY SMITH was accused, and it must be supposed that he thought that the class of public men who were his clients included some who might be inclined to believe the truth of the charges made.

Now if there is this readiness on the part of the public to believe that architects do thus betray their trust, it seemingly follows that there are some black sheep who give cause for this belief, and that the whole profession suffers in reputation in consequence. How can this be stopped? At present any rascal can put a brass plate on his door, styling himself an architect, and as such an individual would scarcely be lacking in audacity and push, he might induce somebody to employ him at a lower fee than the usual rate as set out in the Institute's publication of "The Professional Practice as to the Charges of Architects." A few illicit commissions and the rascal is better recompensed than a properly qualified architect with his 5 per cent. Thus the public is led to believe on the one hand that an architect is overpaid on the Institute scale, and on the other that illicit commissions are in vogue amongst the profession.

IT is to squash this class of gentry that the majority of architects believe registration to be necessary. If, with the exception of the present generation of brass-plate practitioners, no one is allowed to call himself an architect unless he is duly qualified and when so recognised is under the *régime* of some such code of professional ethics as obtains amongst lawyers and doctors, there will be little room for the man who takes work at low fees and makes up the difference in illicit commissions.

ON the other hand, the libel action to which we are referring shows how difficult it is to bring real offenders to book. Suppose Mr. SIDNEY SMITH to have been, instead of an honourable and well-respected architect, one who practised the taking of secret commissions, and his accuser a poor but honest man, how is the latter to face the ordeal of an action for libel or slander? However good your case and however true the charges you cannot go to law and especially face an action for libel unless you can afford to pay. Hence the difficulty under present circumstances of dealing with the few black sheep who bring disrepute upon an honourable profession in which they have no right to be enrolled, but from which at present no one can exclude them.

THE meeting that we report elsewhere and which was held at the Mansion House, under the presidency of the Lord Mayor of London, to discuss the present unsatisfactory state of industrial education and apprenticeship, does not seem to have arrived at any very definite conclusion, but at least served one end: to show that under present economic conditions the system of apprenticeship is impossible of revival. The big factory with its concomitant extended use of machinery and specialisation of the skilled worker has no place for the carefully-trained workman who is master of all branches of his trade. The law of maximum of output with the minimum of cost has abolished the man who could make a chair or a boot from start to finish, and has developed the machinist who can make or finish part of a chair or a boot perfectly and with the utmost rapidity, but who needs a dozen others equally skilful to do their part before the complete article is ready for market. While under the old style a man was making one chair now he and a dozen others have turned out a hundred.

WE hope that the threatened demolition of the old Castle walls of York will not become a fact. An attempt at their removal was made some years ago, but fortunately averted. We should have thought by now that there exists not only a greater reverence and respect for landmarks of the past, but the knowledge that the possession of antiquities is a valuable asset to any town, and even to a cathedral city with the attractions of York and its Minster.

ONE would scarcely imagine St. Helens, Lancashire, as an art centre, but Sir JAMES D. LINTON, in opening the twelfth annual exhibition of water colours and oil paintings by members of the St. Helens Sketching Club, spoke very highly of the quality of the productions of the Sketching Club, expressing himself as quite astonished, and characterising the works he saw as "finished pictures, many of which were quite as good as one saw in any exhibition in London." No doubt the modesty which he described as characteristic of the English appreciation of their own artistic productions, and to which was largely due the false idea entertained on the Continent as to the quality of English art, is largely present in the members of the St. Helens Sketching Club, and has prevented the rest of England knowing of the high quality of the work there produced.

WE are glad to hear that the fund in aid of the reparation of Hexham Abbey Church is progressing well. Canon SAVAGE is certainly making earnest efforts to convince Churchmen of the urgency of the repair to the north transept of which Mr. TEMPLE MOORE has reported in strong terms, and says:—"This is a most grave indictment from our recognised expert, and is no 'wolf' cry, but represents an alarming state of things. We delay and postpone at our peril. If we perpetuate past neglect, we are guilty of grave breach of sacred trust. We can only act, and act with careful supervision, skilled and reverent attention, and rigid economy. Closer examination shows conclusively that the fabric in the 'danger sphere' is in a deplorably unsound and dangerous condition. I firmly believe that had we not, in 1905, repaired and preserved the gable of the north transept, it would have fallen utterly to earth, and would have brought with it in ruinous catastrophe the west wall and the tower. Had we not saved the tower in 1907, the tower would have been down. We have saved the two ends, and must now make permanently secure the length of wall between the ends. In the last century the east end of the choir was lost for ever by a fall, and the outside gable of the south transept in 1878. We dare not trifle in 1909. If the North has any regard for its goodly heritage at Hexham, the North must subscribe to save this west wall. We can levy no rate and impose no tax; we can only appeal for voluntary help, in reliance on the common sense, sympathy, and support of the North, for the ancient cathedral and mother church of Durham and South Northumberland."

ARCHITECTURE: ITS TRUE PRINCIPLES.—XXIII.

By R. OWEN ALLSOP.

ALPHA AND OMEGA.

A FINITE straight line has, æsthetically, two strong points—its beginning and its ending. If the principle underlying this postulate be applied to superficies and to solids, we may gain some idea of why, apart from constructional reasons, a column has base and capital, a wall a superimposed cornice, and perceive a *raison d'être* for many purely architectural devices, besides providing a most useful practical guide at all points of a design in the making.

At the commencement of this essay we instituted a comparison between mode in architecture and manner in man. It requires to be noted how potent for effect of conduct or behaviour are the commencement and closure of acts performed. But *finis coronat opus*—the end outweighs the beginning. A sudden appearance may be joyful, a sudden disappearance rarely so; and if this line of reason be applied, by analogy, to design, we see ample justification for what so often practically occurs in recognised architecture—the unprepared uprising of parts and features from what we might otherwise conclude to be incongruous places of genesis, a common enough, and a beautiful, characteristic in great mediæval buildings.

On the other hand, a sudden disappearance is generally painful or offensive—unless as where, say, Doric flutings are lost in the sunken necking, they again reappear and have a graceful termination—a designed discord, possibly, and return to the harmony. Apart from such exceptions an unmannered, unprepared termination is of all things most unsightly—witness the effect (quite independent of association) of the incompleted column during the course of building construction. We have before advanced the theory that plain surfaces do not strictly afford relief to the eye, hence it is diverted to boundaries, and so *panelling* is not only constructively good, but æsthetically sound in its proper medium. Yet again there may be a reflex action—the margin diverting attention to the enclosure—and where such margin is grandiose, as in a costly and elaborate entablature, vastly emphasised by a bold shadow beneath a powerful architrave, we are naturally disgusted to find a paltry wooden moulding, as in the margin to an expanse of plate glass. From these considerations we must conclude that there is a reason for emphasising a tower top, for the absence of plinths, and can assign a scientific, or quasi-scientific, reason for the offence of bald piers terminating against horizontal members, as architraves and the like. A rude, boorish *ending* has been provided.

There are two kinds of end in architecture, the end of a phrase (as it were) and the true finish—*omicron* and the true *omega*, in a sense. In this way the Doric column is unsuited to stand by itself (as a monument), the abacus being *omicron*, or completing a phrase and introductory to something else. The tapering spire is a true end or culmination. A magnificent cornice is a true *omega* in its place, and hence, doubtless, the reason of that insolvable problem—a satisfactory "attic." But the Doric abacus is an introduction to a new thing—the architrave—as well as completing the whole column, hence is not a finish in the sense of a final, crowning end.

Solid geometrical form seems to satisfy the eye as something complete—an entity—when it represents a regular figure—as a true cube—and it may be that, for this reason, the form just short of the full cube, as also the superficies just short of the true square, are not pleasing. Thus an incomplete cone may be considered offensive, whilst the complete cone is satisfactory. A sense of deformity would be apparent in taking off the top half of a spire. This resultant effect of incomplete elemental figures of geometry may be turned to practical account. The Doric shaft is an incomplete conico-cylindrical figure. For this very reason, emphasised by the numerous converging flute lines, a strong position is created compelling attention to the finish of the complete column, and enhancing the value of the capital.

It might further be argued that the plain cylinder of whatever extent is always an incomplete figure, since there is no reason why it should be either long or short, or of any dimension whatever, being the same incomplete figure at infinity. It thus resembles the straight line, which may be finite or infinite; and from that we might argue further that the cylinder, like the line, has two strong points—its beginning and ending—and that, as whatever the length it can never form any definite, complete object, the demands of æsthetics are that something must be provided to form a finish, as caps and bases. The same general idea leads one to conclude that a cylindrical column may as legitimately be made at choice only two or three diameters in height, or drawn out enormously as in the thin shafts in Gothic pier arcades. Either or any arrangement is—it is assumed—æsthetically correct. In some way, possibly, there is connected with this idea the unsatisfactory effect of the top of large cylindrical architectural masses, and a *motif* for the adoption of the much-criticised quasi-gable at the east end of St. Paul's

Digitized by Google

Cathedral. Conversely, the unsatisfied valency—to borrow a term from chemistry—of the cylinder, makes a drum the best possible preparation for a crowning dome.

A study of the principle here suggested would perhaps prevent such unsightly practices as coarse "ornaments" stuck half-way up a pillar or pier—as a granite hemisphere on a lozenge in the centre of a pilaster. The clean run from base to capital of a column must be considered vital. To place any kind of device midway destroys the effect of this run, and draws attention from the legitimately strong points—base and cap—much as a coarse "swag" from volute to volute ruins the effect of the delicate modelling and light and shade about the Ionic capital.

Every sympathetic architectural draughtsman illustrates, perhaps unconsciously, this law of emphasising the first and the last—and the overruling of the first by the last—in lingering about the termination of vertical lines to the end of avoiding harsh terminations. It is an evidence of an insensible tendency towards a graceful completion of an act.

The general principle here sought to be expressed seems sufficiently natural and fundamental. The flower on the long stalk and the ill-defined origin among the leaves and grasses, exactly corresponds to the main idea. No great importance can be set on the origin (base) of a tower—its summit and upper part is predominant and overrules other parts. A considerable law, with notable exceptions, is a gradual enrichment towards the summit. Where the reverse is arranged and the last storey ends in baldness, the effect is generally offensive; and all elaborate Gothic buildings seem to have growth and upward culmination expressed—the spirit that we notice in a stunted, sturdy oak tree from knarled bowl to foliated finish.

Fig. 45.

Principles, however fundamental and recondite, are useless, and mass arrangements for effect mere vanity, and tend to an art akin to scene-painting unless the spirit of constructionalism overrides all other considerations. If mass alone, and without detail, satisfied the soul of the architect, he would rest content with producing scenic effects, in actual building, as bald as the accompanying sketches.

We suggested in an introductory essay that architecture might well be considered the abstract part of the

Fig. 46.

concrete entity building—that it may be reasonably regarded as a mode or manner simply. In this line of argument the actual building is the thing. We may construct an arcade, it may have ornate or plain piers and arches, but whether plain or ornate the piers and arches are the entity—they are what we desire, the necessary basis of utility. The architecture that we go out to see has walls, arches, piers, towers, pinnacles, domes. All history demonstrates that, given honest intention to build nobly, native talent, scarcely cultured and certainly not highly-gifted in draughtsmanship, beautiful architecture results from honest construction. Therefore, much as we may theorise on contrast, gradation, proportion, and the like, and their fundamental principles, it is all a mere addition to the real act of building or constructing; and it is not shown why we should go out to see fine curves, colours, or broken light about stone or marble whilst there are flowers in the field, sunlight in the west, and fleecy summer clouds, all so immeasurably richer in these distinctive attributes. Moreover, all architectural details (enrichments, carving, and the like) may be inspected on museum screens. Hence we conclude that we really go out to see massive arches as such, elegant columns as such, and real soaring domes and tapering spires. This view is well confirmed by the evidently powerful attraction of quite plain building where is shown an honest intention to produce the beautiful or at least some ruling spirit of grace. In such there is but one great point of difference—the manner how—the difference of line lengths, areas, and proportions, and relative bulks of this to that, all sufficiently evasive of tangible qualities to merit the use of the term "abstract." This spirit of construction must, when all is said and written, ever be that which is of the essence of the architectural. It must be a crucial test of the true architect that he sees interest and beauty, on its plane, in a simple well-built wall of honest brick and stone. It is not easy to imagine an architect who is not a lover of construction

Digitized by Google

as such and who is not absorbed in watching the growth and development of building for its own sake and for its own interest. It is possible that the fascination of "rusticating" must be referred to the fact that it emphasises the spirit of construction—makes more evident that the whole is built up of parts. Unless this much is admitted, so-called first principles are a delusion. Plain, honest building, with intent to please, and naturally graceful as a mere result of that intention, if not architecture, is very near it indeed. All the offences of the ignorant, tasteless designer are not of neglect to add something to simple, plain building, but of uncalled-for and senseless additions to otherwise straightforward construction. Where such plain building is not architectural, it is not for the lack of concrete things, but by reason of the absence of an abstract quality—the manner how. Why is it that the elaborate city building repels whilst we dwell lovingly on the humble efforts of village masons? The answer seems to be that we are interested in honest, apparent construction, where the medley of steel backing and stone screen walls disgusts the soul of all who would give expression and purpose to the mere act of building. It must be concluded that expressive, visible, and homogeneous construction rules in true architecture, and to this principle all other principles must be secondary.

(To be concluded.)

THE SYMBOLISM OF THE CROCODILE IN THE MIDDLE AGES.*

AMONG the numerous animals found in ecclesiastical figure sculpture it is remarkable that so picturesque a character as the crocodile is rarely to be met with in any easily recognisable form. That it was frequently represented in some form or another seems more than likely from the fact that it can be shown by reference to mediæval MSS. to have been the subject of extensive symbolism.

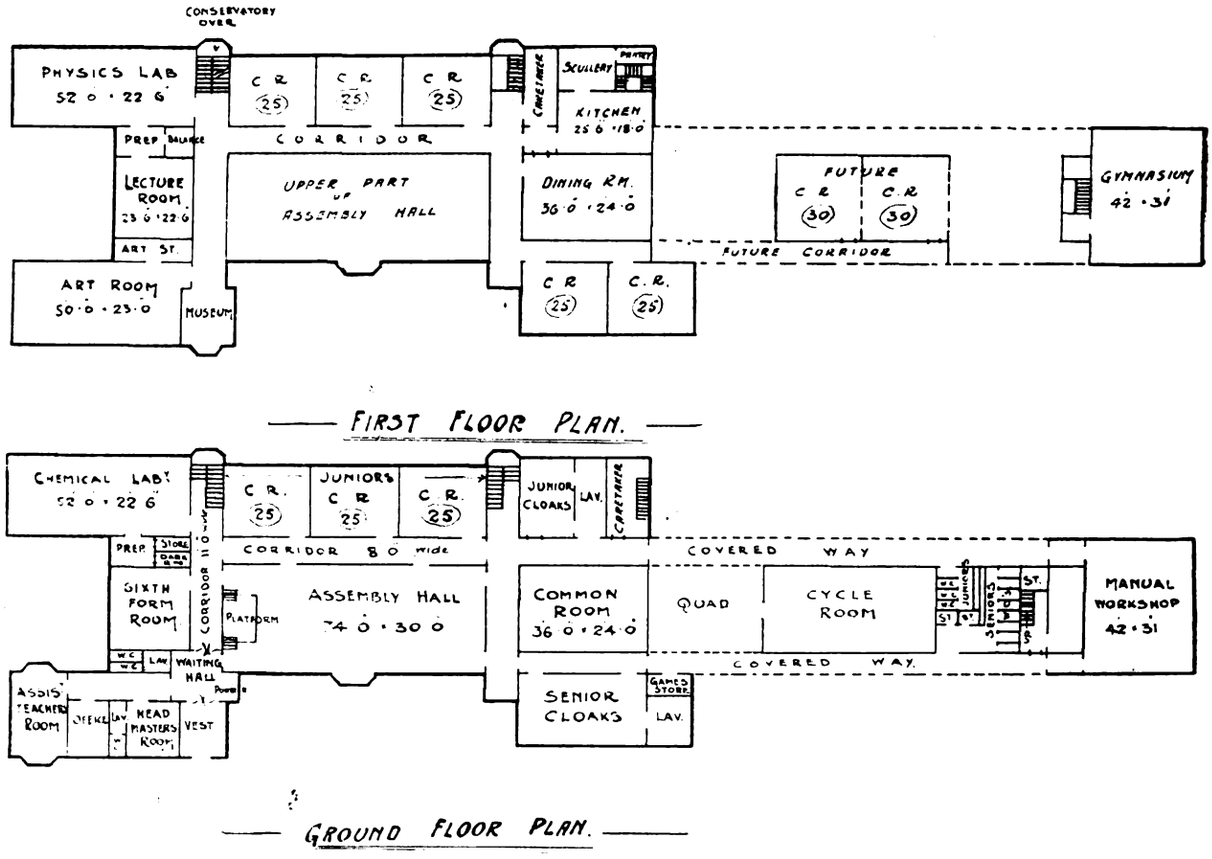
In the earlier period, say the twelfth century, we should not expect to find crocodiles in natural form, owing to the lack of knowledge of its anatomy on the part of artists and masons, and to the fact that exact definition was not regarded as of great importance, only such details being included as might sufficiently indicate the subject. Considerations of space also led to the same result. A curious instance of this may be seen at Alne Church, Yorks, where there is a sculptured representation of a ship with two men in it, with some letters of the incised title Aspido above. This is the abbreviated Greek name of the Aspido Chelone, a shield-shaped tortoise or turtle, and in a secondary sense a great sea-monster, of which there is no sign at all in the picture; the ship is really resting on its back, the greater part of the beast being submerged in the sea.

In his work "L'Art Religieux de XIII. Siècle en France," M. E. Mâle points out that representations of Hell-mouth, such as may be seen on the tympanum at Bourges Cathedral in the scene of the Last Judgment, and elsewhere, were based on the crocodile's head, and that this symbolic employment was due to the description of it in Job, chap. xli. At Bourges the caldron into which lost souls are being thrust is set in the mouth of a monster, and the flames are being blown up by two demons with bellows. M. Mâle bases his view on the fact that the early commentators recognised in Leviathan a figure of Satan and his works. Honorius d'Autun wrote, "Leviathan, the monster who swims in the sea of the world, is Satan. God has cast His line in that sea. The cord of that line is the human generation of Christ; the iron of the hook is the divinity of Jesus Christ; the bait is His humanity. Attracted by the smell of the flesh, Leviathan wishes to seize it, but the hook tears his jaw." The seething-pot, however, which also represented hell, was not always placed in a monster's mouth—*e.g.*, on the great painting at Chaldon, Surrey, A.D. 1200, it stands on its own legs.

This symbolic use of the crocodile clashes altogether with the view held by most archæologists that Jonah's fish was the motive from which such sculptured representations sprang. Although we now know that Job's Leviathan was the crocodile, the people of the Middle Ages probably regarded that animal as some dragon or sea-monster.

The best evidence of the symbolism of the crocodile is to be found in the mediæval "Bestiaries." These were religious natural history books founded upon the appearance and habits of animals, birds and reptiles, the whole being employed to teach religious or moral lessons. In thirteenth-century "Bestiaries" the crocodile usually appears twice over, being classed both with the larger sea-fish and with the land animals. In one MS., for instance, it appears as a long thin yellow eel with a long mouth, and further on among the animals as a clumsy beast. The description given is much the same in all, though the symbolism is usually to be found under its heading as a land animal. MS. Harl. 3244, folio 43, says that under this figure hypocrites and men of luxury and avarice are symbolised. As the crocodile rests by night in the water and by day on land, so hypocrites, although they live in luxury, are delighted if they are reported to live just and holy lives. As the crocodile alone of all animals moves its upper jaw and keeps the lower one immovable, so hypocrites show forth in word only examples of the holy fathers and a goodly supply of their good words; while in deed they show forth very few of the things which they say. Whereas of its dung temporary rejuvenating ointment is made which quickly comes off, so evil men are generally praised by the unlearned for their evil deeds, and are glorified by the praises of this world, as it were with an ointment, but which when the Judge comes will vanish like smoke.

These details came not from Job but from Pliny's "Natural History." That author, who in his turn follows Aristotle and Herodotus, seems to have inspired many of the "Bestiary" illustrations occurring under the heading of Cocodrillus, which show a crocodile either devouring a man or holding him in its claws. It is probable that some of our church carvings of beasts swallowing human beings represent this phase. The symbolism largely speaks for itself. The ingenuity with which the various points of the crocodile's appearance and habits are turned for either religious or moral teaching is something marvellous. It is a symbol of hypocrisy and deceit. The ointment episode is evidently the *pièce de résistance*. Luxury—*i.e.* vice—and avarice were regarded as the two worst sins; and they are the butt of the moralist in the "Bestiary" over and over again.



In architecture we have several beasts which are intended for crocodiles, judging by their resemblance to the MSS. illustrations. At Tissington, Derbyshire, on the Norman font, are two beasts of the clumsiest description, one with a human head in its jaws, the man having been swallowed head first. At Ilam, Staffs, there are two beasts on the Norman font. One has a human head in its jaws, and the other the same, but with a second head lying below. Both these beasts have long tails and feet with long claws. At Bradbourne, close by, on the tower doorway, a beast is shown in relief swallowing a man feet first. On the south side of Yaxley Church, Hunts, there is a big beast astride the parapet which may be a crocodile. It has a long mouth and tail and clawed feet. This, with the other animals on the exterior, appears to date from the fourteenth century.

A much more important episode in which the crocodile is concerned is where it swallows the hydrus, or water snake, and it is one that had a far greater influence upon architectural detail. MS. Harl. 4751, in describing an animal in the river Nile called hydrus, thus describes its method of attack:—"This hydrus is quite hostile to the crocodile, and has this nature and habit, that when it has seen a crocodile asleep on the shore it goes, if its mouth be open, and rolls itself in the mud in order that it may be able more easily to glide into its jaws. The crocodile then suddenly swallows it alive, and then the hydrus, after tearing all the crocodile's bowels to pieces, emerges not only alive, but even unhurt. So then death and hell have the likeness of the crocodile, for the Lord Jesus Christ is hostile to them. For taking on Himself our human flesh, He descended into hell and, bursting all its bowels, led out those who were unjustly held bound by it." The illustration shows half the hydrus in the form of a winged dragon down the dead crocodile's mouth, and the head coming out of his side unhurt.

Here is proof of the crocodile being directly employed to symbolise death and hell in the scene of the "Harrowing of Hell," coupled with illustrations which show it more or less as a beast, or at least with a beast-like head. There appear to be only two examples of this striking symbolic form in ecclesiastical architecture; one is at Bury St. Edmunds, the other at Kilpeck, in Herefordshire. These are the only sculptures in which the crocodile can be at all identified. There is a remarkable correspondence between them. They are of about the same period, of similar design and purpose, and might well have been the work of the same hand. At Bury St. Edmunds the sculpture is part of a gargoyle on the south side; it consists of a crocodile's head with the hydrus

* Abstract of a paper read before the Royal Archæological Institute on December 1 by G. C. Druce, Esq.

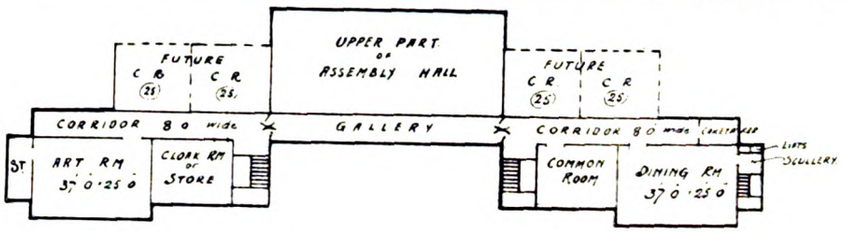
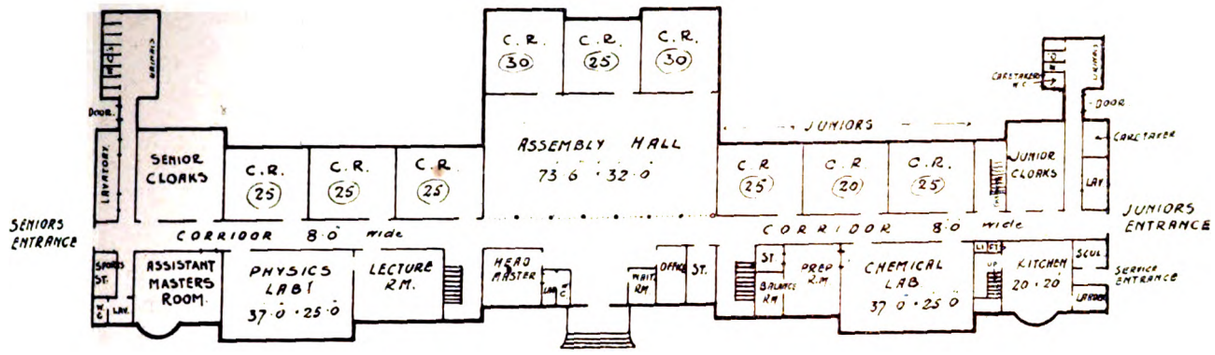
SKETCHES OF FIRST PREMIATED DESIGN FOR PRESTON GRAMMAR SCHOOL.
Messrs. Woolfall & Eccles, Architects.

as a curled snake in its jaws. At Kilpeck the sculpture is more accessible. There is only a head, but it is a good one, and the artist has included a little typical ornament. The hydrus appears as a snake wriggling down its throat. Why this subject is so scarce it is difficult to determine. Presumably the mediæval artists preferred to represent Christ in human form in the "Harrowing of Hell" scene.



The three scenes in which Hell-mouth principally occurs are "The Fall of the Rebellious Angels," "The Harrowing of Hell," and "The Last Judgment." The second is much more common than the first. For general details the twelfth-century example at Lincoln Cathedral on the west front (not to mention two others on the same building) is good. "Hell-mouth" appears as a beast's head with ears, oval eyes, nostril, and skin-folds plainly shown. It is filled with souls, who hold out their hands towards Christ. On the Norman doorway at Quenington, Glos., there is one of the best known sculptured examples of the subject. Satan lies with his hands bound with a ring, as at Lincoln, and Christ thrusts His cross down his throat. "Hell-mouth" in this, as in other English examples, is represented by a head. A further stage is reached at Kencot, Oxon, where on the tympanum of the south doorway both parties in the scene are represented in symbolical form. Sagittarius, here symbolising Christ, is shooting an arrow down a beast's throat.

The subject occurs also in wall paintings. At Pickering there is a fine fifteenth-century example with some good details which correspond well with the MSS. Here "Hell-mouth" is very plainly a beast's mouth with ears, teeth, skin-folds behind the nose (which closely resemble the crocodile shown in MS. Slo. 3544, although painted quite 100 years later), and a little hairy beard. Illustrations of "Hell-mouth" in MSS. dating from the eleventh to the fourteenth centuries vary but little; they all show beast-like heads—one somewhat resembles that of a crocodile and is of grey colour.



As already mentioned, many, if not most, archæologists attribute the beast's head to be that of Jonah's fish taken from his prayer of thanksgiving, "out of the belly of hell," when he had been thrown up by the fish. The earliest illustrations of Jonah are in the Roman catacombs. In the catacomb of Calixtus the fish is clearly one of those hippocampi, or sea monsters, found in classical art having front flappers or paws, big ears, and a much-curled body and tail. In these and other very early representations it is a sea-monster of the dragon type, with wings and curled tail, and it follows the form of marine monster so frequently found in that Pagan art from which Christian art had not yet separated. It is possible that some particular figure in classical mythology, such as the sea-monster of Andromeda, was used as the model for Jonah's fish. Perhaps the earliest "Hell-mouth" is on a Carlovingian ivory of about the ninth century at South Kensington, and it bears no resemblance to the contemporary allegorical classical sea-monsters. All the mediæval illustrations of Jonah and the fish at the British Museum show that the artists intended to draw a natural fish, and their efforts were on the whole fairly successful. Two misereres in Ripon Cathedral show Jonah first being thrown to, and then being disgorged by, a shark-like fish. In the "Bestiaries" Jonah's fish is described, under the heading of "Aspido Vel Cete," as of a size so great that sailors mistook it for an island, and, disembarking, lighted fires on its back, which, when the beast feels it, dives into the water and draws the ship after it. "Thus," says MS. Harl. 3244, "suffer all who are of unbelieving heart and such as are ignorant of the wiles of the devil, putting their trust in him and binding themselves to his works. They sink together with him into the Gehenna of burning fire. Such is his cleverness."

In the English-Latin "Bestiaries" the illustrations of the crocodile show it to be practically always a beast-like animal, and those of Jonah's fish, though both symbolised hell, a more or less natural fish. The "Bestiaries" professed to deal with natural forms, except when they treated of fabulous forms. The paintings and carvings of "Hell-mouth" in churches certainly show a beast's head, not a fish's. It seems probable therefore that an animal was taken for a model, and that that animal was the crocodile. The artists and carvers probably took their cue from the "Bestiaries," with which they were well acquainted. The earliest allusions we have to the "Bestiary" are in the fifth and sixth centuries, and if they were the product of some Christian monk at Alexandria, as is supposed, the crocodile would have had a good chance of being one of the first animals to be made use of and illustrated. No other animal or reptile mentioned fulfils the *rôle* of supplying the model for "Hell-mouth" as does the crocodile.

ILLUSTRATIONS.

QUENBY HALL, LEICESTERSHIRE.

THIS hall was erected in 1636 by one GEORGE ASHBY, in whose family the seat of Quenby had been vested for many years. The unique position, standing on a plateau at a height of five hundred feet above the sea-level, lends an imposing appearance to the structure, and the colours produced by the weathering on both the brick and stonework give an additional charm to it.

The outline of the plan partakes of the later form brought about by evolution from the quadrangular court of the Middle Ages through the gradual omission of the sides forming the quadrangle, and by the extension of the wings producing the so-called H plan.

The great hall still poses as the important feature of the residence at this period, monopolising the first two storeys, and this prevents the possibility of gaining access from one wing to the other except by the ground and second floors, an inconvenience which has just been remedied during recent alterations by limiting the height of the hall to one storey, and thus forming two large rooms on the ground and first floors respectively, but it has been done at the expense of losing the dignity hitherto possessed by this feature.

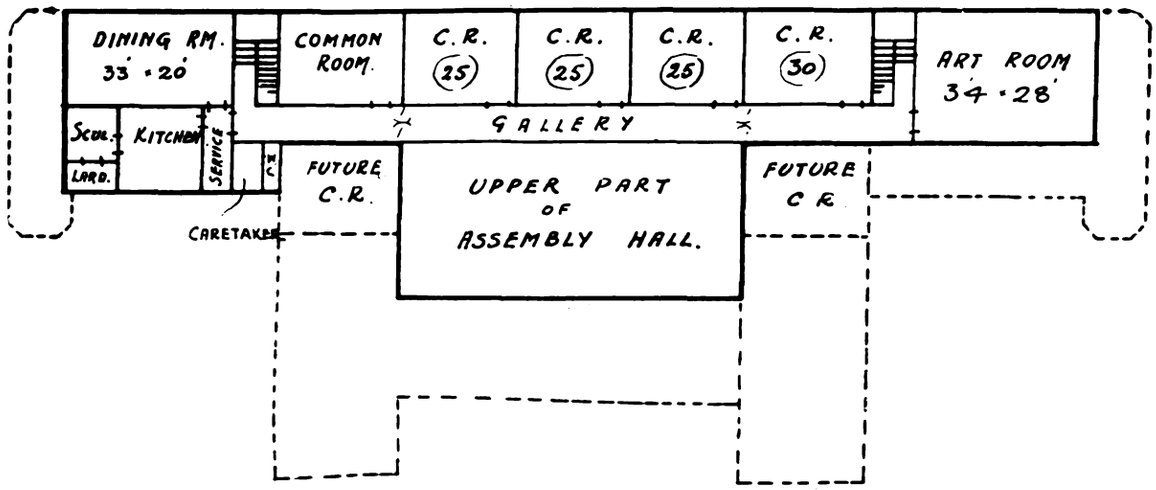
Certain alterations have been effected from time to time in the arrangement of the plan, but nothing organic, and minor details, such as windows being blocked up and painted in imitation of lead cames, have been brought into their original condition of late.

(To be continued with further illustrations next week.)

NEW CHURCH OF ST. MICHAEL, SUNNYSIDE, BERKHAMSTED.

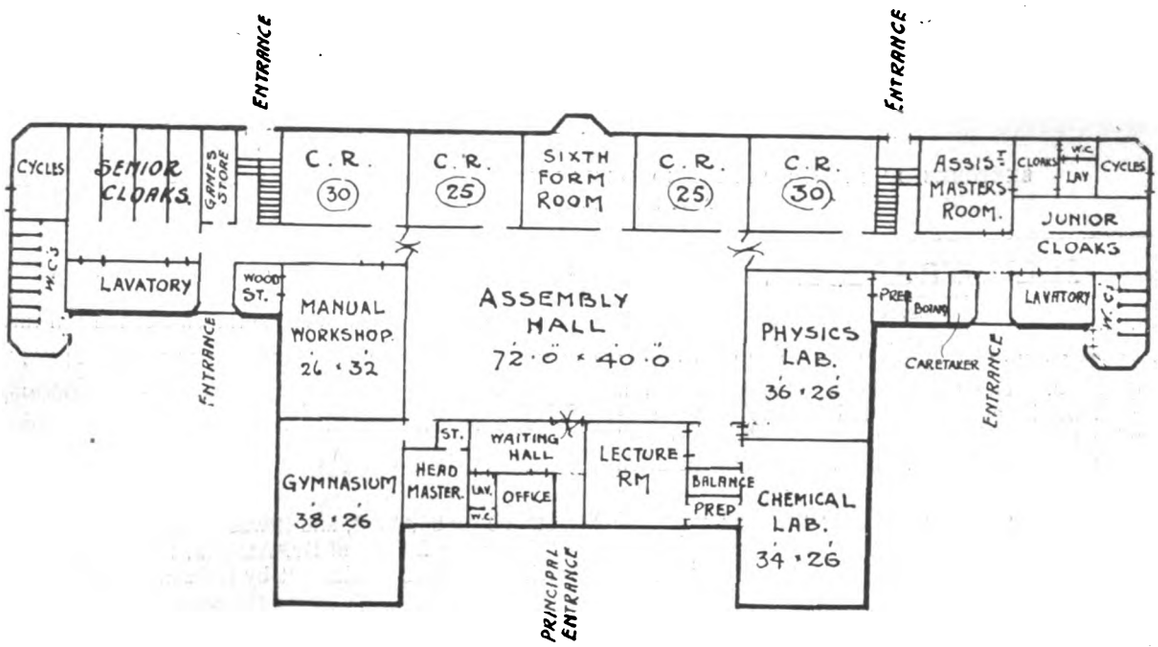
THIS is a new church, built to replace a small iron chapel-of-ease to the mother parish of Northchurch, Herts, some miles away, Sunnyside, although an extension of the old town of Berkhamsted, being in Northchurch ecclesiastically.

The new church has been erected with funds subscribed in the locality, aided by a grant from the Incorporated Church Building Society, of 7 Dean's Yard, S.W., the chancel and its fittings being given by Sir RICHARD COOPER, Bart., in memory of his brother, the late Mr. HERBERT COOPER. The treasurer of the building fund, Mr. GEO. K. HEXT, has borne the cost of the bell turret; and the oak lectern, litany-desk and offering-box, from the architect's designs, have been presented by Mr. A. P. BOYSON, by the architect and the contractors respectively.



The heating chamber and foundations were made the subject of a preliminary contract, which was taken in competition by Messrs. H. & J. MATTHEWS, of Berkhamsted. The foundation-stone of the main building was laid on July 25, 1908, and it was consecrated on June 30, 1909, by the Bishop of ST. ALBANS, the second contract having also been carried out by the same firm of builders from the designs and under the superintendence of Mr. P. M. JOHNSTON, F.S.A., F.R.I.B.A.

The warm-air apparatus and ventilation were installed by Mr. JOHN GRUNDY, of City Road, N., and the stained-glass windows in the chancel are from the studios of Mr. N. H. J. WESTLAKE, F.S.A., the plain glazing being supplied by Messrs. HAYWARD BROS. & ECKSTEIN.



The style of the building and its fittings throughout is that of the early part of the thirteenth century. Local materials, such as field flints, partly dug on the site, and Totternhoe stone (for internal dressings), were largely used. Sussex marble, from the lately reopened quarries, has been employed in the chancel, while Monk's Park and Tisbury stone have been used for the external and some internal work. The roofs have been tiled with sand-faced tiles, and the bell-turret is oak-boarded, with a shingled spire. Most of the wrought ironwork has been executed from the architect's designs, by Mr. W. BAINBRIDGE REYNOLDS and Messrs. H. & C. DAVIS, of Clapham. The encaustic tile pavements, also specially designed, were carried out by Messrs. W. GODWIN & SONS, of Lugwardine. Hereford. A special feature in the construction is the use of concrete for the heart of the walls, with a flint facing externally and a skin of brickwork on the inside.

In plan the church consists of nave, south aisle, and porch, chancel and vestry of two storeys. A detached gardener's tool-shed has been separately built at some distance from the west end to enclose the chimney of the heating apparatus, the flue being carried underground.

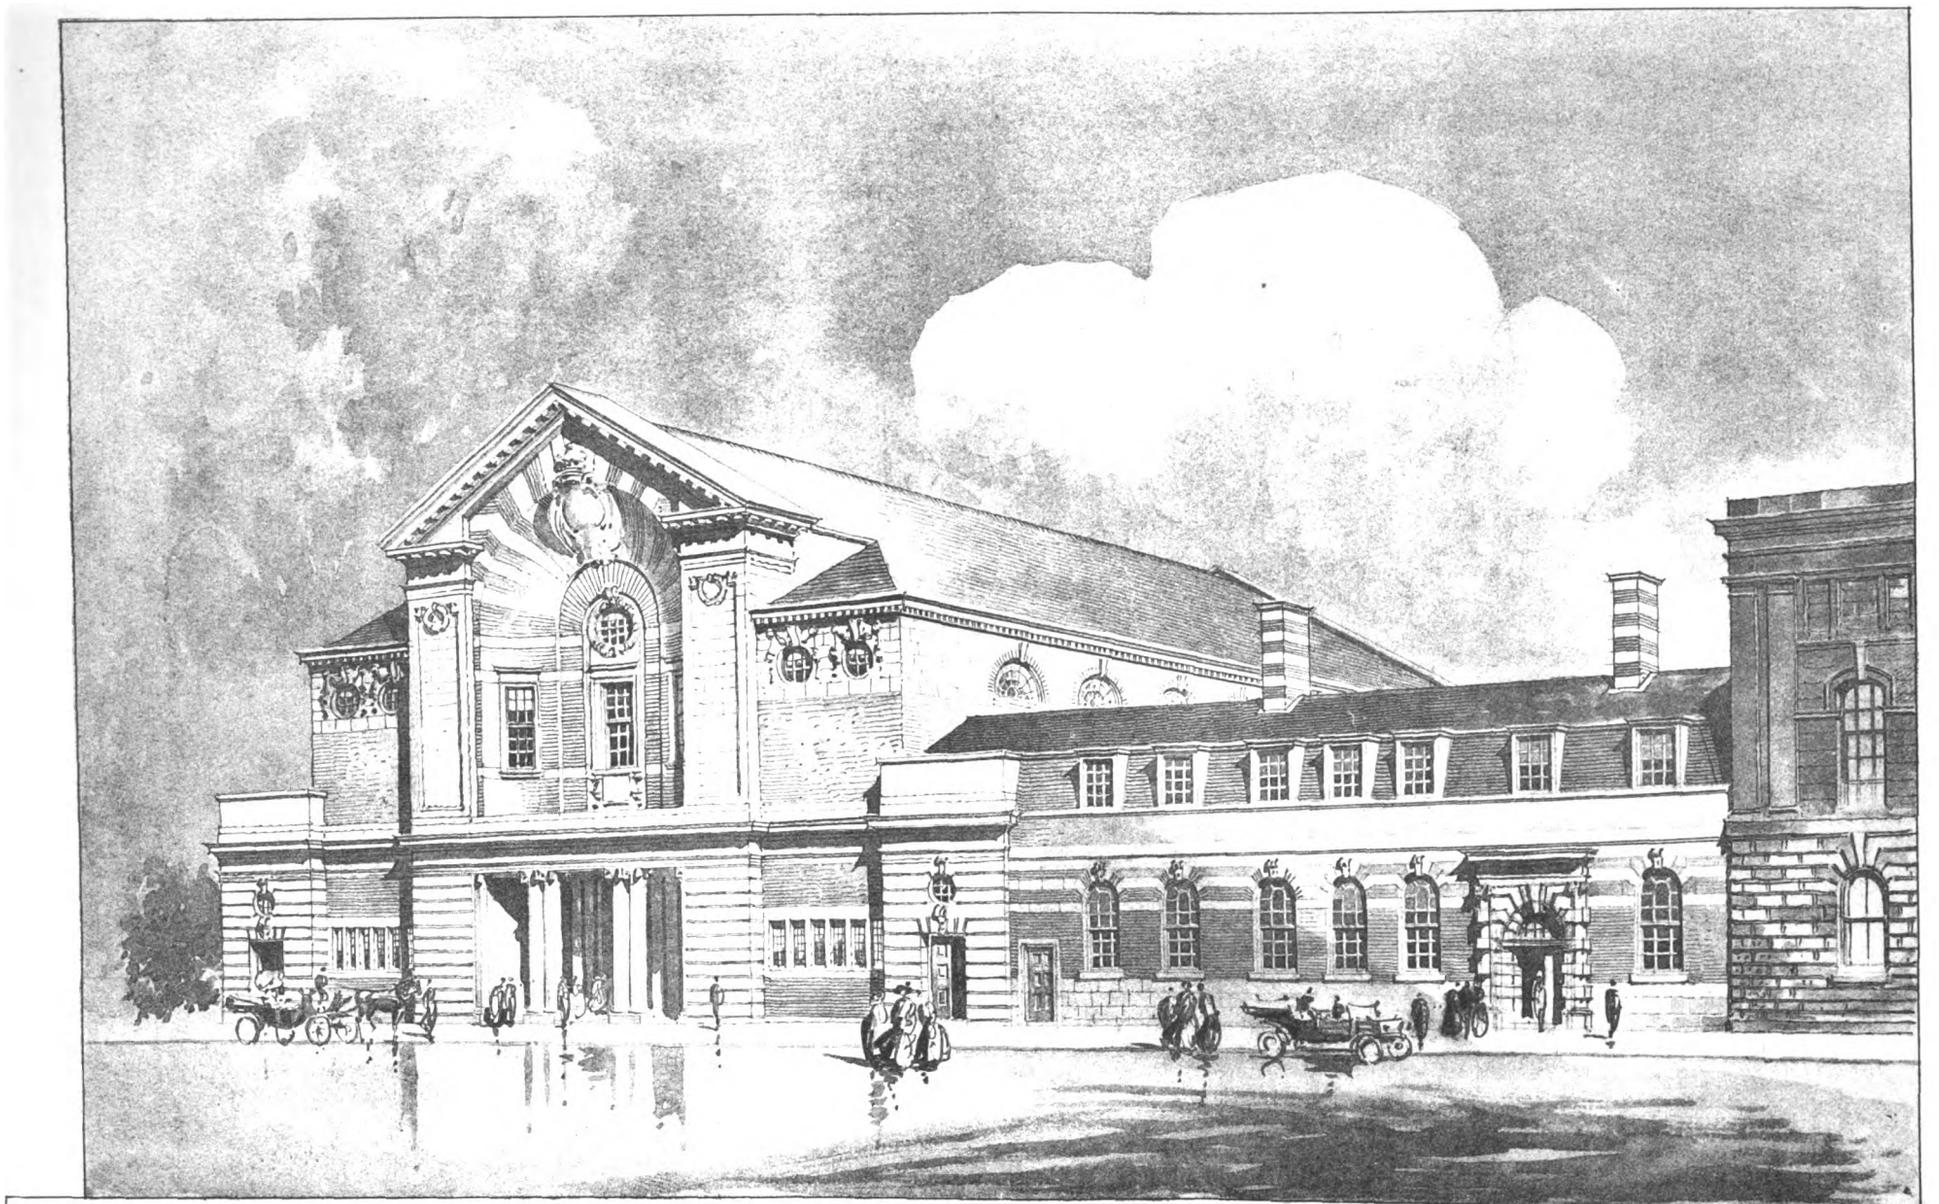
SKETCHES OF THIRD PREMIATED DESIGN FOR PRESTON GRAMMAR SCHOOL.

Messrs. Packer, Drewitt & Drewitt, Architects.

Accommodation has been provided for over 300, at a total cost of between 3,000*l.* and 4,000*l.*

The drawing from which our illustration was taken was exhibited in the Royal Academy this year.

BANK AT MIDDLETON, LANCS.



THIS bank is in course of erection, and will consist of a large banking-room and strong-room on the ground floor, with a store- and clerks' mess-room above. In the basement are store-rooms, heating cellar, &c. The front is to be in Portland stone. The tender of Messrs. Grundy, of Middleton, amounting to 2,090*l.*, was accepted. The architects are Messrs. Potts & Hennings, Manchester.

COMPETITION DESIGN FOR TOWN HALL, STOKE-UPON-TRENT.

THE following is an extract from the authors' report:—"On account of the greater convenience, all the departments are kept on the ground floor, which arrangement is, no doubt, a desirable one. The large assembly hall, with accommodation for 3,250, is placed with its main entrance from Tower Street. Accommodation is provided for cloaks, &c., both in connection with this entrance and also the approach from the Glebe Street entrance. The entrances and accommodation for the chorus and artistes should work conveniently as arranged adjoining Aqueduct Street. Attention might be drawn to the convenience of the prisoners' entrance and the public entrances to the galleries of the Court and the small assembly hall. The present building is altered to suit the new conditions, and the tenancy of the store in the basement is maintained. The elevations to be carried out in red-facing brick and Hollington or Darley Dale stone dressings." The estimated cost was 25,164*l.* The joint architects are Mr. Albert E. Dixon, A.R.I.B.A., 9 St. James Square, Manchester, and Mr. John H. Markham, A.R.I.B.A., 2 Gray's Inn Square, London.

THE SOCIETY OF ARCHITECTS.

A MEETING of the above Society was held on Thursday, December 9, when the following paper on "Town Planning" was read by Mr. Raymond Unwin (member):—It was said of Cecil Rhodes that he thought in continents. The passing of the Town Planning Bill throws upon the architectural profession the duty to expand the scale of its thinking somewhat in the same way. For the last generation or two, in this country at any rate, the architect has centred his thought upon the individual building which he was commissioned to design, and his total inability to influence the surroundings has led him to a large extent to ignore them. The town planning movement, culminating, as it has just done in the passing of an Act conferring powers upon municipal bodies to lay out the plans of their towns in advance, and to make, at any rate, a beginning of treating their towns as large units to be considered as a whole with some foresight, calls upon our profession especially to remember that the whole is greater than the part. We must begin to think in streets, in districts, and in whole cities, and henceforth to regard our buildings not so much as isolated efforts, but as units in a larger whole. Town planning, though in this country almost an unknown and forgotten art to-day, has been practised in all ages and in many parts of the world, and town plans when examined will be found to show an almost infinite degree of variety and individuality. What one may perhaps call the modern period of town planning has already passed through several phases of development in other countries, noticeably in Germany, where during the last fifty years there have developed different styles, characteristic of different periods, showing a growth analagous to the different styles and periods we are familiar with in architecture. As an example of the earlier style as applied to an entirely new town, I may perhaps show the plan of Dalny, which shows evidence of a study of some of the exercises in ideal town planning, such as those of Vasari il Giovane and Scamozzi, at the end of the 16th century, or of Roland Levirloys at the end of the 18th century, with the irregular geometrical plans characteristic alike of Haussmann's work in Paris, and of the German work in the middle of the 19th century. This plan is of special interest, as showing the care that was taken in surveying the ground before the plan was made; not only do we find careful contour levels, but also wind and weather diagrams, the prevailing winds and the aspects having both been taken into account in determining the direction of the main roads.

In the plan of Cologne, we see town planning applied to the more common case of the extension of an existing town. This plan illustrates also the change in the character of German town planning. In the centre may be seen the irregular street lines, characteristic of the medieval town, with a few more modern roads resulting from improvement schemes. In the zone immediately outside this area, which was set at liberty by the extension of the fortification lines during the last century, we see the geometrical type of planning, very like much of that which can be found on the plan of Paris. Cologne has again outgrown its line of fortifications, and, moreover, the change in the character of warfare has rendered them obsolete, and the town is now developing suburbs all round. These it will be seen are being planned by the municipality far ahead of the development, but the geometrical pattern work has been displaced by more flowing lines, showing a marked reaction from the rigidity of the former manner. This may fairly be taken to indicate the intermediate German style and period of German town planning work. It is very interesting to compare the old plan of Paris with the modern plan, and to see the extent to which Haussmann's geometrical planning has displaced the medieval irregular street lines of which Paris once entirely consisted.

The influence of Camillo Sitte in Germany, Austria, and the central European countries generally has resulted in a further development of the curvilinear and irregular style. He advocated a careful study of medieval town plans, and put forward the theory that these plans were the result of conscious design on the part of a people thoroughly imbued with artistic instinct and tradition; and he deduced some rules and many suggestions as to the causes of the wonderful picturesqueness of medieval towns and cities. The plan for the extension of the little town of Kufstein is one of the best examples I know of the most modern style of German work, in which the town planner concentrates his main attention on the building up of picturesque street pictures. Every street, every junction, and indeed, one may say every view in this plan has been carefully thought out, so that when the buildings arise on the building lines laid down, they may group together in the picturesque manner characteristic of medieval cities. It will be found also, that although in no direction are there long, unbroken streets, nevertheless, the lines of the roads are so contrived that it is possible to get about the town in all directions, without inconvenience. At the same time, it would not be very easy to plan an extensive tramway system for such a town.

The plan of Marienburg is a very good example of a combination of the two styles of planning. We see certain straight thoroughfares giving a sense of framework to the town plan, while the details are filled in with the irregular streets, planned to produce picturesque groups of buildings so characteristic of the modern German school.

Signs are not wanting that there will shortly be in Germany considerable reaction against the extreme irregularity and the excessive striving after the picturesque which has marked their recent work. Here in England, we are about to take up this new art of town design. It behoves us to study very carefully all that has been done before. We have the great advantage of being able, if we will, to profit, by the extensive experiments in different styles of work that have been carried out on the Continent during the last fifty years. We have in this country scraps of two traditions in town planning. There is the very regular and symmetrical work characteristic of the Renaissance period, when, for a while, large schemes were grasped and sometimes carried out, as we may see in many parts of London, notably in the squares lying between Holborn and the Euston Road, and in part of the district round Regent's Park. In addition, we find in Bournemouth, Buxton, Eastbourne, and some other towns, that have grown up mainly on the property of one great landowner, town plans worked out under the influence of the landscape school of gardeners, consisting of flowing so-called natural lines, but generally speaking lacking in any large grasp or any sense of wholeness in the completed plan. I think it is of the greatest importance that we should, in this country, not make up our minds too hurriedly as to one style or the other, until we have pretty thoroughly grasped the advantages of both, and the reasons which have led to the adoption of one or the other. I cannot help thinking that we have here, as so often, the elements of a new synthesis, and hoping that it may be within our power to evolve in this country a style of town planning which shall show alike a due appreciation of the beauties of our usually irregular and undulating sites, and of that other beauty which springs from ordered and regular design. The problem before us really is how to weld together into one harmonious whole the undulating surface and irregular features of our country and the definite lines and ordered arrangement characteristic of good design. And, with a view to further illustrating this, I would like to contrast for you two cities.

The first is the peasants' city of Rothenburg, a unique example of unspoiled medieval picturesqueness, the character of which springs not from the possession of supremely beautiful buildings, but from the fact that in the whole of the town there is hardly one that does not show a simple comely beauty. The plan is interesting as showing how the form of the town has been influenced by the nature of the ground, the line along the west side following the crest of the high ground on the edge of the deep ravine which has been worn out by the winding Tauber, a small river, the musical murmuring of which, as heard all along this side of the town on a quiet evening, adds not a little to the charm of the place. It is a characteristic medieval plan marked by an entire want of symmetry and regularity, subordinated to the double line of fortifications, one dating from the 13th and the other from the 14th century, beyond the outline of which, except for a small settlement adjacent to the railway station, the town has never developed. But, while lacking that symmetry and order which goes to make up a pattern on paper, none the less this plan has in it many of the far more important elements of a good town design. It has, in a marked degree, both scale and framework. Its Market Place with the group of smaller *places* linking it up with the great Church, the Rathhaus, and the Herrngasse, the great street in which the patricians of the town once lived, form together a centre finely dominating the town, while the roads leading to the main gateways are also marked out in importance by their comparative width and directness. I must not omit to mention the delightful absence of that region of untidy allotments, derelict building sites and rubbish heaps which forms a girdle round nearly all our growing towns to-day; the way in which the unspoilt country comes right up to the wall of the town, inside which the crowded, I must admit, in many cases over-crowded city commences, has a very fine effect, and one which suggests to us whether there may not be found for our modern suburbs

Digitized by Google

some means of defining and limiting their areas adapted to our modern conditions of life as the town wall was adapted to those of our forefathers.

Before passing from this beautiful little city, which, more than any other I know, carries one back to the time when all building work was governed by a simple instinctively appreciated tradition which seems to have made it as natural to build beautifully as our modern life has seemed at times to make it natural to do the reverse, I would like to emphasise the unity of effect which has resulted from the following of that tradition. Almost every building in the town, including the Rathhaus and the church, is roofed with the beautiful hand-made Rothenburg tile of a quiet brown colour, here and there brightened with touches of brilliant red where the tile has cleansed itself, as such tiles will. The buildings are either built of stone, the prevailing tones of which are cream and light brown, or more frequently are plastered and treated with lime-wash of very similar tones. Bits of bright green and grey occur in the woodwork, the whole producing a unity of effect which is quite astonishing to anybody accustomed to the hopeless jumble of materials, colours, styles and forms which characterise the modern town or suburb. And yet there is no lack of variety, for while the general form of the town, the multiple gables and picturesque groups of turrets and pinnacles give it an essentially Gothic character much of the detail is distinctly Renaissance.

In the slide which I show of part of the Oberschmidtgasse this variety is well illustrated.

Let us contrast with Rothenburg the city of Karlsruhe, which owes its origin to the Margrave Charles William of Baden-Durlach, who transferred his residence thither in 1715, at which date the plan of the town was made. It is now the capital of the Grand Duchy of Baden, and as will be seen from the plan, the Ducal Palace forms the central feature of the town. A tower ingeniously built out on a wing stands on the centre point from which a series of streets radiate to all parts of the town, so planned that this tower is the terminal feature in one direction along all these streets. On the other side, there is an extensive forest, through which straight alleys have been cut, radiating from this tower in like manner. The Market Place is formed on the axis line of the town, which coincides with the central radiating street. Before the Schloss is a large fan shaped garden *place* having the front of the Schloss at the apex with stable buildings, barracks, residences, and a theatre, forming the radiating flanks, while round the circular arc is built up a colonnaded crescent of houses, cut at intervals by the narrow radiating streets. Beyond this crescent, a circular road links up all the radiating streets, while at right-angles to the axial line at the north end of the Market Place runs a wide straight thoroughfare from east to west, connecting with various diagonal streets, and completing the general framework of the town. This road leads directly to the district of Muhlburg, and to the docks of Rheinhafen, which put the town in communication with the much used water course of the Rhine. Sufficient of the early 18th century buildings remain to enable one to form a fairly good idea of the effect that would have been produced if the town had been entirely built up at that period. It would be difficult to imagine a greater contrast than that between the style of this town and that of Rothenburg. The straight, formal lines of the streets, the geometrically shaped *places*, the axial treatment of the Market Place, the regular, horizontal sky lines, and the entire absence of gables, with the symmetrical and regular treatment of the facades, all emphasise this difference, and yet, there is the same feeling of unity of effect, the same sense of scale and framework leading up to a definite town centre that marked the more picturesque and irregular Rothenburg.

Much skill was shown in the treatment of the many acute and obtuse angled corner buildings, a very good effect being frequently obtained by very simple means. We cannot fail to notice how such a regular treatment suffers when the style is departed from, and buildings of different heights and different characters break in upon the orderly arrangement, and, I think, we should take warning, and before embarking upon any system which depends for its success on the complete maintenance of very regular lines, make fairly sure that we can see our way to maintain these.

The site of Karlsruhe is a level plain, having apparently nothing of natural undulation or feature within the area of the town, which needed to be much considered by the planner, so that probably in this case the unusual degree of formality of treatment was justified by the conditions. The faults of the plan are the excessive and monotonous insistence of the somewhat uninteresting tower of the Schloss, the large number of acute angled corners and the uncomfortable shape of many of the *places*, road junctions, and building plots formed.

Its virtues are the definite leading up to a centre, and the interest which each part derives from being a portion of a definite scheme, the easy communication from point to point, and the simplicity of the general framework, which is easily grasped.

Bearing in mind the comparison we have made of the formal 18th century city with the informal 14th century one, let us pass to consider in greater detail some of the component parts. We have seen that both plans are alike characterised by an extensive use of *places* of various sizes and forms. The special characteristic of the medieval *place* is the sense of enclosure and the completed frame of buildings which is produced; the shape is indefinite. In the Market Place at Nuremberg, for example, although at first sight there appears to be many roads leading in to the place, and forming breaks in the buildings, it is remarkable how the arrangement of these does, in reality, leave the framework of buildings unbroken. Either the roads are curved slightly after they leave the Square, or their direction is broken, or they are made to pass out at right angles to the line of vision so that it would hardly be possible to stand in any part of the Square and get a long, unbroken vista out of it. Contrast with this the modern Max Josef Platz, Munich, where the long straight vista at the side of the theatre breaks up the frame of the buildings and gradually destroys any sense of enclosure in this part of the *place*. The Piazza del Campo, at Sienna, is another instance of a place of quite irregular form on plan, in which so far as its shape and arrangement are the result of conscious design, the aim appears to have been mainly to secure the sense of enclosure, and an unbroken frame of buildings. This, of course, was easy with the narrow streets common in medieval times, in which a very slight deviation from the straight line is enough to close the vista. The Market Place at Stuttgart, is an example of this. We have only to imagine two modern 50-feet streets replacing the narrow ones shown on the slide to realise how, unless they were very rapidly deviated from the straight, the sense of enclosure in that *place* would be entirely destroyed.

In Renaissance *places*, quite different effects were aimed at, regularity and symmetry of shape and architectural treatment are in them the prominent features, and the sense of enclosure is sometimes wanting.

The importance of linking up the buildings and producing to some extent a continuity of frame, was, however, apparently recognised in the laying out of the fine group of Renaissance *places* at Nancy. Where the angles or ends would otherwise have been open, they have been to some extent screened by wrought-iron railings, masses of foliage and semi-circular loggie or arched gateways. But the importance of enclosure and linking up of the buildings has not always been recognised in the planning of architectural *places*, particularly those resulting from, what I may perhaps call, axial treatment. It is not, of course, the only desirable effect to be produced in a *place*, but there is a peculiar sense of completeness and unity and a suggestion of quiet and repose which results from this treatment, which it is most desirable to maintain in many *places*. The Amalienborg Platz, at Copenhagen, is a very fine instance of an architecturally treated *place* in which no attempt is made to secure this element of definite enclosure in the *place* itself. A monument stands on the intersection of the centre lines of the two cross roads, and the four palaces which face diagonally upon the *place* are each completed by lower wing buildings affording something of the gateway treatment to the roads themselves, and giving a fine sense of unity to the whole effect. But in reality, this *place* may be regarded rather as the glorified treatment of a street junction than a *place* in the sense in which we have been using the word hitherto.

The Karolinen Platz, at Munich, is another example of the treatment of a multiple road junction, with a central feature on the axis of the various roads, and with definite architectural treatment of the corners, but lacking any sense of enclosure. In such *places* one is not tempted to loiter: they are apt to be distinctly draughty. From these one naturally passes to consider *places* formed mainly for the purpose of facilitating traffic. Many examples of these may be found in Paris; at points where several roads converge there is usually formed some open space to facilitate the circulation of traffic, and to secure some degree of architectural treatment to the corners of the various streets. The Place de l'Etoile is the largest of these. The whole question of the circulation of traffic, and the best way of reducing the inconvenience which must always arise in busy streets, where several streams of traffic pass in and out or across the main lines, is too large for me to touch upon to-night, and I can only say, in passing,

Digitized by Google

that there are two widely different views held on the matter. The German school of modern town planners believe that as far as possible multiple road junctions should be avoided, and each branch street is better brought singly into the main street. They consider that many single junctions disturb the flow of traffic less than a fewer number of multiple junctions. On the other hand, the French school of town planners consider it advisable to give long, straight, unbroken streets, converging at certain points where the traffic can rearrange itself all at one point, and pass off in many directions; and in some cases, as in the Place de l'Etoile, it has been suggested that the best way of dealing with the traffic is to keep it always moving round the centre point in one direction, which, although it obliges a certain portion of the traffic to take a rather longer route, avoids the lengthy stoppages of first one stream and then the other, which are otherwise necessary at crowded crossings.

(To be concluded.)

THE METHODS OF PAINTING ON STUCCO.*

(Concluded from last week.)

THE mural painter with great regret substitutes the short and hard zinc for the plastic lead with its clinging nature. The oil process with white lead has been used in countless masterpieces, and ever will be. When protected with varnish, age only mellows it. But white lead is deadly when used in quantities, and is foreign to the nature of the lime itself. It should therefore be decidedly rejected for all mural painting upon lime: directly lead and lime come together they rob each other of qualities necessary to stability.

Great attempts have also been made to consolidate the lime by the aid of soluble glass. Water glass was first produced in Germany in 1828. Made from sand with an excess of alkali, it is soluble in hot water; when cold it becomes a kind of varnish. In application it is both mixed with the colours and sprayed upon the face of the painting. If sprayed upon a surface colder than itself (like as varnish will) it goes milky. One sad example of this is said to have occurred to the grand historic paintings by Maclise in the Houses of Parliament. To protect these magnificent works of art when finished a surface of water glass was applied to them. Alas! in the application of the silicate (a purely mechanical affair) it became chilled, resulting in the production of a white opaque film which obscured the work. Varnish had then to be resorted to to reveal the painting, which is objectionable, and as gloss partially hides a large painting whose whole extent should be seen without any obscurity.

Great efforts in research upon this important subject have been made in Germany. Some years ago Professor Schlotthaer, an artist, and Councillor Fuchs, chemist, produced a system which they claimed would defy all tests, even that of acid. Only water was used in the application of the colour; all the pigments could be mixed together with the medium, and would keep moist any length of time till applied. They did not change in drying, and one painting could be passed over another. This ideal process appears to have been founded upon the water-glass method, and is a secret. Wilhelm von Kaulbach carried out his immensely grand frescoes with the aid of this medium.

Lately a German process has been introduced into this country, called the "Keim method." It has been advocated in lectures by Robert Austin and the Rev. J. A. Rivington. Some important work has been carried out in this method. It is claimed that it possesses all the advantages belonging to the before mentioned German process without the secrecy. The fixing fluid alone appears to be a secret, and is supplied by Keim, of Munich. Professor Austin allows the use of all the pigments. The Rev. J. A. Rivington, in his lecture on this process which he gave in the theatre of South Kensington Museum, counselled the worker to restrict himself to the following:—Zinc white, chrome green, the umbers, light red, ivory, black, barytes, chrome red, the siennas, yellow ochre, chromic oxide, zinc yellow, cadmium, terra vert. He also advocates the use of grey instead of white lime. As a criticism the yellow ochre is not necessary; raw sienna will answer the purpose. As to the chrome green, if is meant by this a mixture of prussiate of iron and acetate of lead, surely it is an objectionable colour to use on lime, as the use of grey lime would not detract from richness of colour, while white lime is an aid to sweetness and purity of tone.

There is a tendency in this process to reduce body in the pigments. In order to restore this, and also to help to render them permanent, the following composition, to be mixed with the colours before applying them, is recommended:—Barium carbonate, calcium fluoride, aluminium hydrate, silicic acid.

Sometimes a difficulty occurs in obtaining this last. It can, however, be produced by dissolving sodium silicate with hydrochloric acid, then filtering it, and finally washing it on a piece of rag. It is then in a fit state to mix with the pigments. There appears in these new processes an endeavour to give to the artist the use of all the pigments he is used to in oil painting, regardless of whether they agree with the lime or no. It appears we cannot get away from established procedure or custom.

Each and all of the "tempera" methods are proper for lime, and superior to the oil process for mural work, since oil always darkens. Still, the buono process has hitherto resulted in the finest quality of colour. This master manner has resulted in grandeur and permanence. Our climate, however, demands a method which will counteract its destructive power, a process suitable for paintings of great expanse, one which will unite facility of application with permanence, and permanence with beauty of colour. What grandeur there is in those buildings in which the painting, and even the modelled work is all of lime, the walls of a church, for instance, instead of forming an opaque contrast, uniting with the windows in one glow of bright reflecting colour, possible only when the principal ingredient of both coloured modelling and painted work is all of lime.

The President (Mr. G. DESPIERRES) said they had all listened with pleasure to the paper, and they would certainly consider it a very interesting reminiscence of the laborious way in which ancient artists and artisans produced the lasting and delightful results which were still to-day remarkable examples of their admirable skill and wonderful perseverance. He could not, however, help expressing his regret that the lecturer had not given them the benefit of his experience with regard to the application of paints on lime, plaster and cement walls of modern times. They must not lose sight of the fact that the conditions under which mural decoration was carried out in the twelfth and thirteenth centuries were very different to those of the present day. With our ancestors, he said, labour and time appeared almost as negligible quantities, whereas to-day they were of the utmost importance. They must all admit the charm and lasting effects of some of the mural painting to be seen in a fair state of preservation in Italy and France, but scientific investigation had revealed that some of the delightful blues, full of warmth and depth, had been obtained by applying from twenty to thirty successive coats of finely ground glass coloured with cobalt salts; they were therefore at once faced with the difficulty of finding the artist and artisan who would be prepared to do such laborious work, and more especially there would be greater difficulty in finding the generous patron to pay for it. The lecturer had told them of the importance of lime being well and completely slacked, and that opinion was shared by most of them; but the old Italian method, he thought, would not appeal to the modern builder and decorator. The mania for speed affected everybody and everything, and dwelling-houses were expected by the owners to be decorated and habitable a few months after the foundations had been laid.

Mr. C. E. WILKINSON said they fully appreciated the labour which the lecture had involved, but it seemed more an art criticism than a practical demonstration, and he had hoped by the title of the paper that it would have been the latter.

Mr. J. G. MACINTOSH thought stucco was used for making images and ornaments, and he had expected to hear how colour was applied to them.

Mr. A. S. JENNINGS said he had been misled as to the meaning of the word stucco. He thought it meant the plastering of the outside surfaces of a building in order to imitate stone. He would be glad, he said, if the lecturer could tell them how to deal with such stucco work and how to treat it in the best possible manner.

On the motion of the PRESIDENT, a hearty vote of thanks was accorded the author of the paper.

Mr. FOURNISS, in his reply, said the modern decorative trade method of covering up the bright lime surface with coats of white lead tinted with all and every pigment was as unscientific as it was inartistic. It was as fatal to the colour as it was to the worker. There was no affinity in the outward skin of paint material and the lime ground to which it was applied, clinging as it did to the surface by the aid of oil. When the oil decayed the alien film returned to dust; a coat

* A paper read by Mr. William Fourniss before the Paint and Varnish Society on November 4.

Digitized by Google

of varnish would prolong its life, but the gloss revealed the inequalities of the wall, hiding portions of it. In order to cause the finishing colour to be without gloss the general trade practice was to give the work a final coat of colour made up of the volatile turps to which had been added a minute quantity of varnish, resulting in that most delicate of surfaces called flatting. It could not be touched without damage, and any repairing was impossible. Such a method the author held was not only a misuse of colour, but it was also misnamed, since the ancient name of flatting was "distemper."

FIRE-RESISTING CONSTRUCTION AND FIRE.*

IT is with considerable temerity that I, a layman, appear to-night to address a body of professional gentlemen on the subject of our meeting. I do not intend, however, saying much by way of instruction because I recognise it would be presumption on my part to offer advice upon a subject which is engaging the attention of the building world. I propose to demonstrate by the lantern slides the effects of fires upon buildings, from which I am sure you will be able to draw conclusions far more satisfactory to yourselves than anything I could tell you.

My experience has led me to the conclusion that it is not so much the matter of material as of internal arrangement of areas, floor spaces, partitions and divisions, that is all-important in determining how far a building with its contents will resist effects of fire within its walls. The non-inflammability or otherwise of constructive material can have no retarding effect, for instance, in a light goods warehouse, where the floors are arranged in a series of galleries round a well through the centre of the building. And yet the materials in such buildings are carefully selected on the most scientific principles.

The disposition of spaces, partitions and, above all, the particular uses to which the building is intended to be applied, are the governing factors in fire-resisting construction. It is erroneous to apply the term to the structure alone. I am inclined to the belief that no building, of whatever nature, stocked with highly inflammable goods, when once the stock has got well alight, will withstand the effects of the fire without sustaining serious damage to its stability.

I propose to show you the effects of fire on various building material, by which you will see that whilst under certain inexplicable conditions where a particular stone or manufactured material will come out of the ordeal in one instance, it disastrously fails in another.

A most essential and deciding factor in a building during a fire, and which forms an important bearing upon the stability of stone and other material, is the air currents. Most materials, subjected to excessive heat in a still atmosphere, with a gradual rise and fall of temperature, will not be seriously affected; but if the same materials are subjected to sudden alternating currents of hot and cold air, the effects of expansion and contraction play havoc with walls and supports.

I will first take as an illustration the effect of fire upon what is commonly supposed to be an exceedingly reliable and "fireproof" requisite to most buildings, especially in Scotland, viz. a stone stair.

I may perhaps better illustrate my contention by explaining that, as you gentlemen all know, a stone stair has its slabs embedded in the wall. The effects of a sudden application of heat to the projecting portion of the slab causes it to expand; that portion of the slab which is embedded in the wall is not so suddenly affected, and if it were it could not expand in the same ratio as the projecting portion: as a consequence the expansion causes a fracture at the edge of the wall and the projecting portion falls to the ground. What makes the stone stair unreliable under these conditions is that it is not essential that the stone should become in actual contact with flame, but the heat set up by fire in another portion of the building is sufficient to collapse the stonework. I have repeatedly seen at fires in large houses, where the stone stair has been taken up to the second or third floor, and continued thence to the top floor by a light wooden stair, the stonework has collapsed into fragments and the wooden stair at the top, where the greatest heat has been generated, has been almost wholly unaffected. On the other hand, a common white wood stair often remains in position, and what is left of the unconsumed timber is sufficient to admit of firemen passing over it with safety. A hard-wood stair, say of 1-inch treads, filled in with pugging or deafening and a soffit of good plaster on the underside, will withstand the effects of actual contact with flame for the whole period of a fire, and, unlike stone, it is not affected by cold air or water. It is the sudden alternation of heat and cold which causes stone to collapse.

Of all material used in building construction, and particularly for stairs and unprotected landings, stone is the most dangerous when subjected to the effects of fire. The position as well as the composition of stairs is an important matter to consider in designing buildings, particularly those of a public character, where large numbers of the public are to assemble. The stair-well should not be within the main building, but should be attached; it is also a mistake to enclose these stair-wells within four walls; the top outer half of each landing should be open to let off smoke or vitiated air. The size and number of stair-wells should be determined by the number of people likely to require to use them. The common stair in an ordinary tenement in Scotland does not add to the comfort or safety of the residents; a fire occurring on the lower floors causes the upper floors to be filled with smoke. Most common stairs are not ventilated at the top, consequently all the smoke escaping into the stairs from the house in which the fire has occurred has to be cleared off through the houses on the top floors. From a sanitary point of view the same thing applies.

It has often occurred to me that, instead of running the front wall of tenements up to the top in an unbroken line, balconies should be formed on each landing, the top half of which would be open to the air. The stairs would always be ventilated, no draughts flowing up under the doors, and no accumulation of vitiated air on the top floors. Such an arrangement would be an immense advantage in case of fire, because only the particular house on fire would be affected by the smoke, whereas with an enclosed stair, as at present existing, a fire on the lower flats means that the whole of the residents above have to turn out and are often rescued from suffocation from the windows. I might also suggest that ornamental balconies would be a break in the monotony of our long rows of flat-walled tenement streets.

It should be borne in mind that stone stairs will not prevent smoke and heat flowing up the stair-well, and that, no matter what may be the construction of the stair, no human being can face the heat that would cause a wooden stair to burst into actual flame, consequently a wooden stair that will remain intact under all conditions is safer than any material that is affected by heat or cold.

The results of fires in different parts of the world have demonstrated most clearly that there has not yet been constructed any special class of structure that has withstood the ravages of a conflagration. It is difficult to say what constitutes a really fireproof structure. I think it may be safely concluded that given a building of any material, and fill it with combustible stock, if that stock becomes thoroughly well alight and inaccessible to modern fire-fighting appliances, the building will be destroyed. Metal construction has failed, almost every variety of stone has proved to behave disastrously when exposed to a fierce fire, and of all building material good, sound, and solid timber, though doomed in the end, has been found to withstand the effects of fire longer than iron or steel. One trait in its favour is that it is neither distorted nor deflected by the heat. A wooden beam must be consumed to the breaking point before it gives way. Sound and seasoned timber gives far greater security and stability to a building on fire, and permits of the fire being attacked from within.

As an illustration of this contention, I take the case of an ordinary tenement in Scotland. It is very rarely that a fire spreads from one floor to the next above, and yet the very commonest of building material is employed.

The exposed surface above the fire, in the first place, is common, and often inferior plaster ceiling on wooden lathing nailed to the underside of the joisting; the joisting is rough, of the 9 by 3 standard; then you get the deafening, a luxury rarely met with in English houses. The deafening is often non-inflammable or very slow combustion, but it serves the dual purpose of not only checking the fire, but it also blocks up the air spaces and prevents the flow of air and flame between the joisting and protects the under side of the flooring of the flat above.

As you, gentlemen, all know, this class of construction is of a very common order, both in point of view of quality of material and workmanship. Tenements which are run up at the cheapest possible price do not admit of very much in the way of specially selected and seasoned material. The internal divisions and the method, rather than material, are responsible for rarity of large fires in tenement buildings.

* A paper on "Effects of Fire on Fire-resisting Construction," read by Mr. A. Pordage, Firemaster of Edinburgh, at a meeting of the Edinburgh Architectural Association at Edinburgh on December 1.

Digitized by Google

For large external walls stone has proved to be absolutely unreliable. In the early days of my career in the fire service in London, fires in the older warehouses of brick and timber construction were always followed up from floor to floor, without consideration for falling floors and bulging walls; but the introduction of unprotected iron for supports and joisting altered the complexion of fires entirely. The deflection and buckling of the girders bulged and brought down walls, and concrete slabs used as flooring frequently did, and still does, more damage by wrecking than the actual fire.

Properly bonded brick with good mortar will withstand the fiercest fire, and, what is more noteworthy with regard to a brick wall, is that after all supports have either been burned or fallen away, the wall will remain in position for days after a fire. One striking instance of such a case occurred at the great whisky fire at Dundee in 1907. A brick wall 45 feet high and 40 feet wide, 18 inches thick, was the only one of the many party walls which withstood the effects of the fire.

Brick is least affected of all material, and will withstand the exposure to a fierce fire and application of water many times without detriment to its stability. I have not found in my experience any other form of construction of which the same may be said.

Concrete floorings, though incombustible, are not fire-resisting, and usually fail in the early stages of a fire; reinforced concrete has, however, remedied the defect so apparent in the early application of concrete.

Steel and wrought-iron columns, adequately protected, have in many instances failed most disastrously, and in others they have succeeded in keeping other ironwork intact. A mere coating of concrete is not sufficient; there should be two or three inches securely anchored to the column and girder, as in all cases air spaces, pipes and tubing should be excluded from the coating round ironwork. In fact, the coating should be solid; the expansion of piping and tubing bursts the coating and exposes the iron.

If concrete is of a satisfactory aggregate, and is thickly coated and anchored on to steel and ironwork, it is contended that unequal expansion of either material is almost impossible. I am of opinion that reinforced concrete of brick, slag or cinder aggregate is satisfactory for floor construction, and will withstand fire better than any other form of metal construction yet introduced.

We have not had very much experience yet with reinforced concrete, as it is practically a recent introduction; but in the great American fires of the last few years this particular construction has stood the test better than anything else.

In dealing with the fire-resisting properties of buildings, it is, of course, important that the construction should be such as will retard the spread of a fire from one section to another, and a word in the direction of the growing tendency towards extraordinarily high steel frame building may not be out of place. Our building regulations have so far kept the dimensions of these buildings within reasonable limits; but, owing to their apparent fire-resisting properties, there is an inclination to follow the American methods. Already in London there are several such buildings of ten and twelve floors. Buildings beyond 80 feet may be considered to be beyond the immediate resources of modern fire appliances. Consequently, when a fire occurs beyond that limit, it cannot be so readily attacked, it has longer time to get ahead before being reached, and the chances are that the fire will spread amongst the upper floors of adjacent buildings.

This class of building has a large surface of wall opening enclosed by glass, which affords no protection from outside fires. It is due to this fact that the great fires of Baltimore and San Francisco spread so rapidly. The fire, travelling with the direction of the wind, passed through the window openings, out of the top of one building into another, jumping over the spaces occupied by smaller buildings, which latter in many cases escaped entirely.

Taking the structures apart from the contents at the Baltimore fire in 1904, most of the frame buildings, which were burned out in so far as the contents and fixtures were concerned, and whose skeleton frames remained, cannot be said to have behaved satisfactorily. The top floors, which were inaccessible to the fire-fighting appliances, acted as fire conductors, their stone and ornamental dressings were stripped by the effects of the heat, making the work of the firemen below extremely hazardous. An extract from the report of Chief of Engineers of the United States of America says, "The exterior walls of many of the so-called fireproof buildings ought to be taken down; all of them are more seriously damaged than appears."

Of the lessons learned by experiences of fire-resisting buildings we have to go, amongst other things, to America for the best information on record about building material, and I propose to give a few extracts from the excellent report presented to the United States Government by the special committee appointed to report on the great fire of Baltimore in 1904.

The report says:—"For exterior walls, both stone and terra cotta suffered severely. The effect of fire on terra cotta was a surprise; it was thought that architectural terra cotta for external walls was reasonably fireproof, but it failed completely at this conflagration. It cracked and fell to pieces, and the heat seemed to destroy its texture; in some cases it became soft and pliable. More particularly was this the case with projecting and highly ornamental work."

With regard to internal fireproofing, the report says:—"The only successful partitions were of brick: these lost their plaster, but were otherwise undamaged. Of hollow terra cotta partitions 85 per cent. were destroyed. Metal lath and plaster failed everywhere. Coke breeze or cinder concrete behaved admirably: in many instances where the flooring had not been subjected to damage by wreckage the cinder concrete floor remained solid and intact." It is important, however, with regard to coke and cinder aggregates for concrete that all combustible and partly consumed coal be rigidly excluded.

I have experienced several instances where coke breeze concrete has become incandescent. In addition to its fire-resisting qualities, it has the advantage of being superior in lightness to all other forms of concrete.

Stone of every description suffered severely, particularly projecting parts.

Terra cotta facings and ornamental work failed completely.

Granite spalled badly—worse than any other stone under moderate heat.

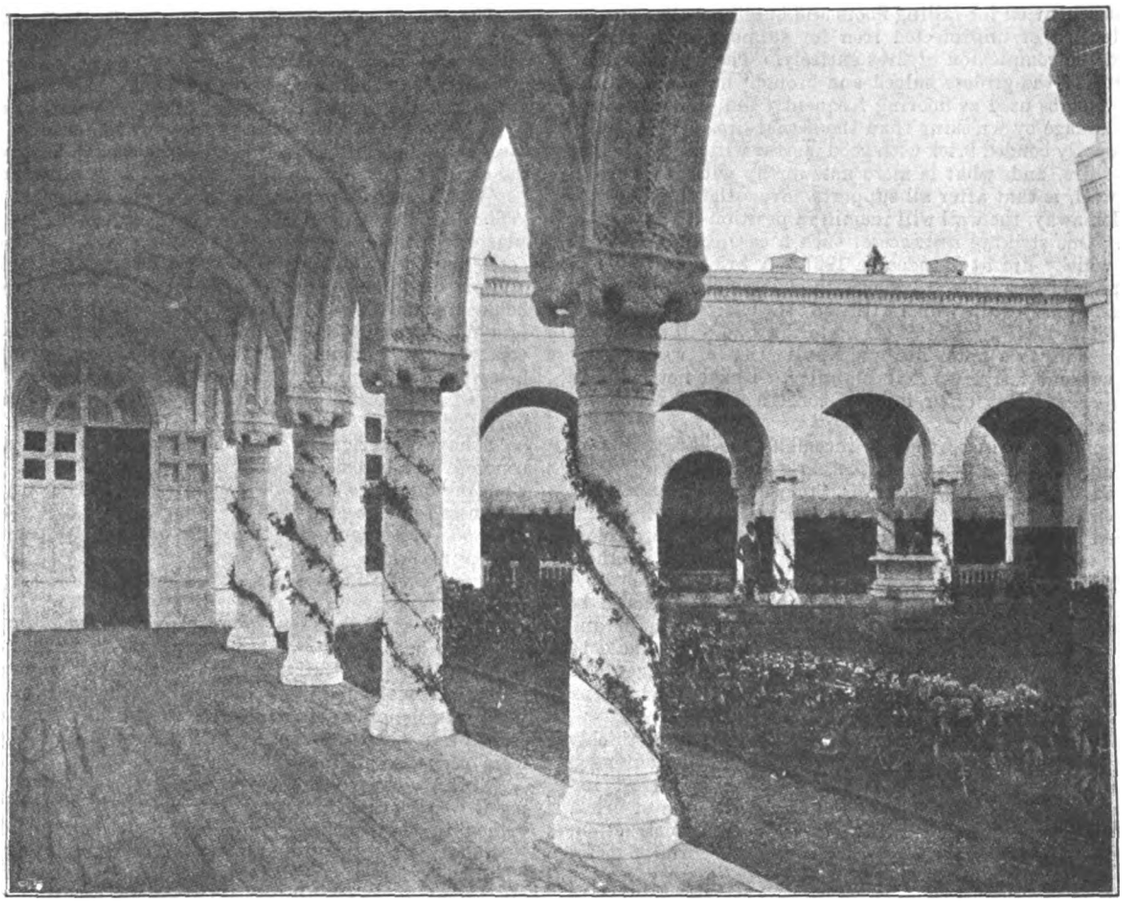
Marble spalled badly, but not so much as the granite.

Of materials used in exterior walls, properly bonded brickwork was the only thing that was successful. The only successful partitions were brick walls, which lost the plaster, but were otherwise undamaged.

Nothing can convey more clearly the value of the fireproof construction in a fire than one of the quotations contained in the conclusions of the special committee of the National Fire Protection Association of the United States of America, which says:—"It may be expected that in fires of great severity the steel frame, its protective covering, the walls and floor arches alone will remain, and even these will be more or less damaged according to the character of the construction and materials used.

"The contents of a fire-resisting building, without proper subdivision and no adequate protection against exposing fires, are scarcely any safer as regards destruction by fire than if contained in a building of ordinary construction."

These conclusions, arrived at after careful and exhaustive inquiry in the results of the various building constructions, prove conclusively that the tall steel-frame built fireproof building acts as a fire conductor when the contents of the building are alight and get beyond control of the fire equipment.



In support of the foregoing, a series of slides of the San Francisco and Baltimore conflagrations were shown, demonstrating the following effects of fire upon buildings:—

1. The failure of stonework.
2. The failure of hollow tile protection to columns.
3. The failure of hollow tile floorings.
4. The failure in some instances of reinforced concrete in frame buildings, and
5. The success of same material in others.
6. The success of brickwork generally in walls, brick partition, and brick columns.
7. Cast-iron columns, protected and unprotected, were shown to have failed completely.
8. Lattice girder supports were generally a failure.
9. Interesting pictures also showed the success and failure of both iron and armoured doors.
10. An interesting picture demonstrating the efficiency of wire glass as a protection from outside fires. Two lower floors which were so protected were intact, whereas the two upper floors in which the windows were of plain glass were burnt out.

The Trustees of the late Mr. Sutton are negotiating with the Liverpool Corporation for a part of their Lisburn Farm Estate as a site for some 150 model cottages to be let at rents such as would readily command tenants from among the poorest classes of the community. The trustees have still about two millions sterling available for the erection of model dwellings.

THE LILLA GARDEN COURT AT STOCKHOLM EXHIBITION.—Ferdinand Boberg, Architect.

THE PRESENT ASPECT OF ELECTRIC LIGHTING.*

(*Concluded from last week.*)

IT may be objected that if there be no meter and no restrictions the consumer will waste the commodity. If the objection were valid the present system of water supply in London would be an impossibility. It must not be forgotten further that the longer the lamps are used the greater the cost to the consumer of lamp renewals, which thus acts to a certain extent automatically as a check.

As the station is charging per lamp, it must obviously also have some check on the consumer in order that he may not, for instance, substitute a 100-c.p. lamp for the 25-c.p. lamp allowed for. We prefer to do this by using special lamp-holders, such that only lamps which are sold by the station or its agents can be used. The consumer who comes back too often for lamp renewals will thus be detected and dealt with accordingly if it be found that he is wasting current.

Taking the average life of the lamps at 1,200 hours, they would use in that time, say, 36 units per 25-c.p. lamp. This at 0.4*d.* per unit represents 1*s.* 2½*d.*, and where the station sells the lamps, the profit on their sale would to a great extent automatically compensate for the wastefulness of any of its consumers.

It is obvious, therefore, that even with a wasteful consumer the station could not lose much, and a meter can, if desired, be put in to check in special cases any consumers suspected of wilful waste. For the reasons above set forth we believe that all stations having normally low running costs could, with great advantage to themselves, supply the long-hour consumer, who at present generally uses gas, at a fixed charge per lamp per annum, which would be well below what he is at present paying. The price will naturally vary for each district, but a fair average, inclusive of wiring rental, appears to us to be 12*s.* per 30-watt lamp per annum for a continuous supply, and 10*s.* per annum for a "dusk to dawn" supply.

This system we call the "Contract" system, to distinguish it from the "Contract Demand" system.

The proposal is, of course, by no means new, but it was practically an impossible one as long as we were restricted to the carbon filament lamps. The introduction of the wire lamp and the great reduction in the running costs during the past few years have, as we endeavour to show, entirely altered the position.

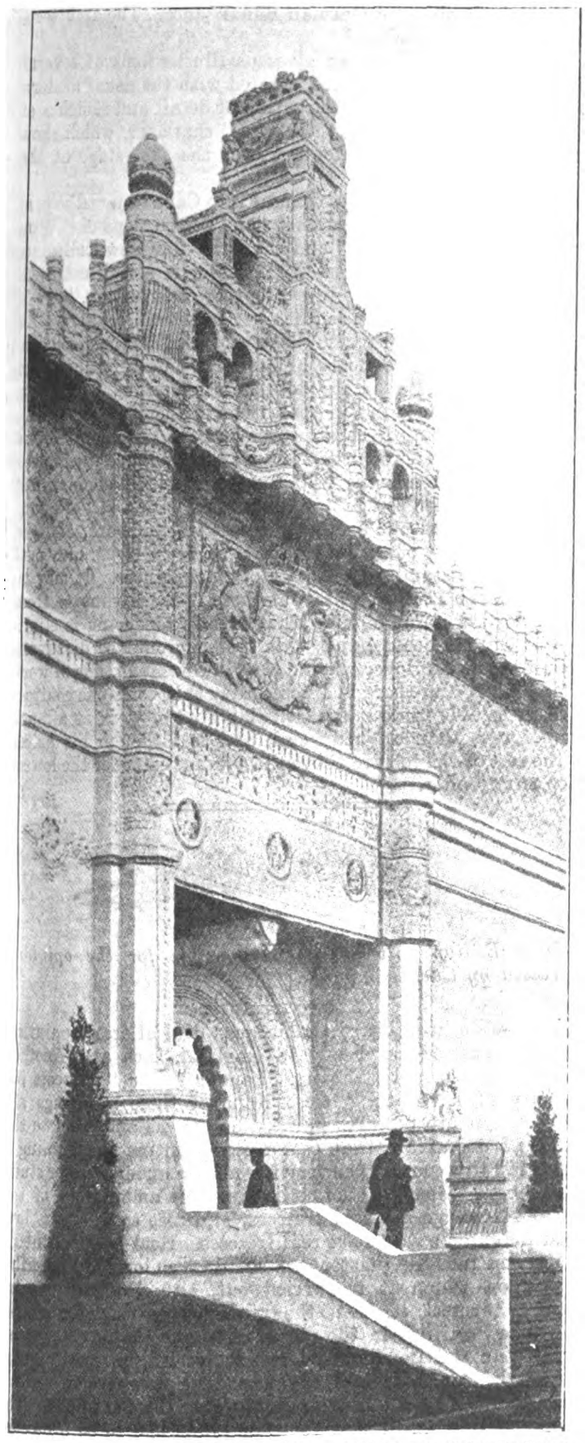
Credit must be given to Mr. Wilkinson, of Harrogate, for being one of the first to appreciate the altered position of affairs, he having introduced into his district the principle of charging small consumers by a fixed sum of 11*s.* per lamp per annum.

The contract system does more than simplify the clerical work of the station. It is one thing to go to a prospective consumer and explain that at the price you are charging electricity is cheaper than gas. In nine cases out of ten he will be sceptical, and will wait until he sees his neighbours' bills before he will come on.

It is quite another matter when you can go to him and say, "Come and look at this room lit electrically; you can have your house lit with the same lamps and can use them as you like for a fixed charge per lamp per annum."

If you can get over the difficulty of the first cost of the wiring you have in all probability secured that man as a consumer.

We are of opinion that in the future purely lighting stations will, in order to secure the necessary large number of new consumers, be absolutely forced, either directly or through a subsidiary company, to undertake the wiring of houses and to supply lamps—in fact, to sell light, and not electrical energy.



By this means any improvement in the efficiency of the lamp will be of benefit to the stations, and not, as at present, a loss to them. It will be in their interest to do all in their power to encourage the lamp makers, and to seek to give the maximum illumination for the minimum of current.

At present what do we see? Half the electrical world

THE MAIN PORTAL AT STOCKHOLM EXHIBITION.
FERDINAND BOBERG, Architect.

counting their losses due to an invention which should have proved, and may yet prove, as great a benefit to the industry as it undoubtedly is to the consumer.

To bring this about, however, other innovations must follow the introduction of the wire lamp. Among others, it is all-important that the cost of wiring should be reduced, and, as many of the new consumers will have only a few lights, that the cost of services be brought down also.

During the past year or so considerable attention has been given to this problem, and a number of very excellent systems of economical wiring have been launched on the electrical world. They all have their good points, and it is for each engineer to select the one which best meets his requirements.

On alternate-current systems some form of concentric wiring with earthed outer is not only the cheapest, per se, but enables considerable economies to be effected in other directions. Only single-pole switches and fuses are required, and the insulation of the one pole can be abolished or reduced to a very small amount. Since the advent of the wire lamp a large number of concentric wiring installations with earthed outer have been put in, using a double-wound transformer, so that the supply mains are absolutely distinct and separate from the interior wiring.

Some might object that, as lamps of 25 c.p. are now available for 200 volts, the use of a transformer is unnecessary. It must not be forgotten, however, that even if nothing less than a 25-c.p. lamp is required, the price of the 200-volt lamp is 4*s.* 3*d.*, and of the 50-volt 2*s.* 9*d.*, or 16-c.p. 2*s.* 6*d.*, to say nothing of the greater durability of the lower-voltage lamp. The cost of a double-wound transformer is now so low that the saving on the first cost of the lamps is sufficient in most cases to cover it, whilst the saving in renewal of lamps, coupled with the efficiency of the lower-voltage lamps, amply suffices to meet the cost of the magnetisation units. Hence the difference in cost of wiring due to the use of one wire instead of two is pure gain.

The wiring can, by adopting one or other of the new systems, be brought down to 10*s.* to 12*s.* per light, or, say, 1*s.* 3*d.* per annum for upkeep, interest, and sinking fund.

Where the standing charges amuont to 17*l.* per kilowatt of consumers' maximum demand, a figure which is not likely to be exceeded by many stations, and allowing for 80 per cent. of the lights installed being on at once, a 30-watt lamp can be supplied for from 8*s.* 7*d.* to 10*s.* 2*d.*, or, including the free wiring, for 9*s.* 10*d.* to 11*s.* 5*d.* per annum. It is not likely that the average burning hours will be as high as 2,000, so that it is evident that an ordinary long-hour consumer can be supplied under these conditions for a sum not exceeding 10*s.* to 12*s.* per 30-watt lamp. As it is not proposed to put 30-watt lamps in the smaller rooms, a 10*s.* inclusive charge would in many cases be amply justified.

In suburban and country districts, for which the foregoing system is particularly suited, there is generally very little demand for current during the daytime.

Particularly with a small alternating-current station great economies can be effected if a supply be only given from dusk to dawn, the station being shut down during the daytime, and provisions are made under the Board of Trade Regulations whereby consent to this may be obtained.

In addition to the saving in labour at the station, the limited hour supply reduces transformer losses, and also prevents any waste of current during the daytime.

By using internal-combustion engines current can be quickly turned on in the case of fog or unusual darkness, under which conditions a supply is given.

In three districts for which provisional orders have been recently obtained it is proposed to work on this plan, and the necessary consents have in each case been given by the local authority on pointing out that, for the sake of one or two who wished to burn an odd light in the daytime, it would be necessary, if a continuous supply were insisted on, to increase the price to the great majority who only require light during the hours of darkness.

Of course, there is not quite so much gain if the station be run with steam plant as if gas or oil engines be used.

Whilst in most districts it will pay a man with only a few lights, which he uses in consequence for fairly long hours, to use electricity at the above price per 30-watt 25-c.p. lamp per annum to cover wiring charges and the use of current as required, the man with fifty lamps would find the charge too high. Nor, indeed, would it be justified, as we have assumed so far that 80 per cent. of the lights installed are turned on at once, whilst the consumer with a greater number of lamps will probably never use at one time more than a small proportion of his lights, the great majority of which will only be in use for a comparatively short time per annum.

To meet this difficulty we put in a limit indicator, ask the consumer to switch on the maximum number of lamps he wishes to use at once, and charge him, say, 12*s.* per 30-watt lamp, calculated on the number to which the limit indicator is set, and 2*s.* per lamp on the remainder to cover the wiring charges. He thus settles his own diversity factor and is charged accordingly.

This enables him to put in lamps where he naturally would not use them if he had to pay full price on all lamps, and at the same time obviates the absurdity one so often sees, viz. a station providing capital for free-wired lamps which do not even pay the annual wiring charges.

Another plan which has been adopted is to charge, say, 10*s.* per lamp for the first five lamps, 8*s.* per lamp per annum for the next five, 7*s.* 6*d.* per lamp per annum for the

Digitized by Google

next ten, and 5s. per lamp for all above that number, the exact figures depending on the size of the average installation in the district.

Such a scale is in most cases, however, not so satisfactory as the first plan, as it assumes that the habits of all consumers having an equal number of lights installed are the same, which is generally far from being the case.

We venture to think that the future of electric lighting lies more especially amongst those consumers whom gas has hitherto claimed entirely as its own.

No gas company can afford to lay on gas, make a fixed charge per annum dependent on the number of burners, and allow the consumer to use as much gas as he pleases. We believe that an electric light company can deal with the consumer on this basis and make a profit out of it.

Comparing the present proposals with the conditions obtaining only three years ago what do we find? The standing charges of the station and mains per unit of candle-power capacity have, by means of the wire lamp, been reduced by nearly two-thirds; by using double-wound transformers interior wiring becomes single wire instead of double; a main cable consisting of a single No. 18 wire can, at 100 volts, supply all installations of twenty 16-c.p. lamps or under; the old double-pole distribution fuseboard is replaced by a single 5-ampere fuse; the meter becomes a memory of the past: a single service supplies a terrace of houses, and electric light commends itself to all long-hour consumers on the score of price independently of other considerations.

Probably in a very few years supply mains will be extended into most districts which till now have been neglected because they only contain small houses. The generating stations will use internal-combustion engines, which in many cases will only work during the hours of darkness, the supply being alternating-current single-phase at about 2,000 volts. Scattered houses will be supplied from transformers fed by tappings direct off the 2,000-volt mains, and the more thickly populated districts off the low-tension networks. The interior wiring will be put in by the supply company or their agents, and will be "earthed return." The lighting of the living-rooms will be by means of single 25-c.p. lamps, with plain white opal or similar shades fixed direct on the ceiling, thus giving a well-diffused light and avoiding risk of mechanical damage to the lamps.

Book-keeping and collection duties will be reduced to a minimum, as there will be a fixed inclusive charge of about 2s. 6d. to 3s. per lamp per quarter, paid in advance, and the first quarter's charge might with advantage be made to become due as soon as the house is wired.

On this basis capital will find in electric lighting as safe an investment as it does in water or other high-class securities, and as soon as this is realised not only the investor, but everyone connected with electricity, will reap the benefit.

OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* has an excellent special number on school houses, in which the latest development of school planning and construction as practised in the United States can be studied. Every British architect who designs a school should get a copy, as the American methods are full of suggestiveness. Particularly valuable are the detailed accounts of heating and ventilation. It is noteworthy that both in America and in Germany the fetish of the central hall with its many disadvantages is no longer worshipped.

La Construction Moderne illustrates a very commonplace smoking-room, which executed in padouk may look better in reality than in the drawing. A cottage or villa at Bethysy-saint-Pierre would hardly gain a prize in a *Daily Mail* Ideal Home Show though exhibited at the Salon, but the remaining illustration of a monument "Montanyas Regaladas," erected at Perpignan, is a remarkably fine piece of imaginative sculpture by M. R. Sudre.

Deutsche Bauzeitung gives us an example of modern German school architecture in the Schiller school with master's house at Fechenheim-on-Main, of which Herr Franz Thyriot is the architect.

Berliner Architekturwelt, in addition to its usual collection of views of domestic architecture, has a design in quite the grand manner for the new technical high school at Buenos Aires, by Ernst Reutsch and W. Brurein, of Charlottenburg.

Dekorative Kunst has discovered our own Arthur Rackham, of whose book-illustration work a well illustrated appreciation is given. The remainder of the number is given to arts and crafts rather than art with a capital A, but there is plenty of art notwithstanding.

Der Architekt describes and illustrates the new Post Office at Wiener-Neustadt, which with the general severity suitable to its function combines some piquant pieces of detail based on the Barock phase of German Renaissance. The architects are Theiss and Jaksch.

A Construcçao Moderna gives us illustrations of several mansions of considerable size, treated with the usual modern Portuguese inchoate conglomeration of detail and sketches of accessories of virulent "art nouveau" character, which show that the Peninsula has not got over the first stage of the fever.

Construction gives us an insight into Canadian methods of school planning with illustrations and descriptions of "Winnipeg's School Building," and the Brantford new Collegiate Institute. The Hotel Mossop, Toronto, is also illustrated, and is said to be "of absolute fireproof construction." We have not got quite as far as that yet in the old country. As the building is of steel frame construction with reinforced concrete and porous tile floors and porous tile partitions, our remembrance of Baltimore does not inspire us with overwhelming confidence in the absolutism of the fire protection.

The *Engineering Record* records how the Bureau of Sewers of the Borough of Brooklyn, New York City, have introduced a new system of tendering, which seems to us to have manifest advantages. Each contractor is supplied with a bill of quantities fully priced out by the engineer for the work, and the various tenderers simply quote their offer in terms of a percentage of the standard estimate of the engineer. It may be 90 per cent. or 110 per cent., but there is the advantage from an employer's point of view that erratic tendering is eliminated. On the other hand, this system would be disadvantageous to the employer where many and varied kinds of work are included, and there is a possibility that some one contractor may be able to do one particular kind of work at a much cheaper rate than anybody else, and so although his prices for the rest of the job are above the average can offer the lowest lump sum tender.

Correspondence.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Fresco Painting.

Sir,—We have heard that a good deal of fresco painting has been carried out lately in England, such as "Another fresco in the Royal Exchange, London," and "Frescoes for the city of Liverpool," &c. None of these paintings are frescoes, but are pictures painted on canvas and fixed to the walls. I am afraid that real fresco-painting is becoming a lost art in this country, as very few artists understand or study the process. Some of the ceilings in the ambulatory of the Royal Exchange are real frescoes, and also some of the late Lord Leighton's works are real frescoes. Real fresco painting penetrates into the plaster and will last as long as the buildings upon which it is carried out, and does not require glass to protect it from the atmosphere—*vide* the above-mentioned ceilings in the Royal Exchange, which had been exposed to the London atmosphere for a great many years before the open court of the Exchange was covered with a glass roof. Also all fresco paintings on the Continent. The supposed frescoes in the House of Lords had to be protected by covering the same with glass, to save them from perishing (these were under cover). This clearly proves that they are not real fresco paintings. There are two ways of painting frescoes. Firstly on the fresh plaster before it sets, and this is a very tedious process as it has to be done in sections of say a foot or a yard at a time. The second process is to paint the subject upon a porous plastered dry surface with encaustic medium; care must also be taken in the colours used, as a great many are liable to perish and fade when used in lime. However an experienced fresco painter knows which colours will stand in lime. The well-known picture "The Last Supper," by the great master, Leonardo da Vinci, which was said to be a fresco, completely perished, but has lately been very cleverly and successfully restored to its original beauty by an Italian artist. Before painting with oil medium came into use most of the, to this day, well-preserved works, were done with encaustic medium—*vide* the old coloured work in Egypt, Greece, Italy, France, Germany, &c. Of course a decorative colour scheme can be got in mosaic, marbles, stones, and woods, but this is not so artistic, effective and lasting as fresco painting.—Yours obediently,

Henry H. B. Sang,
Architecte-Décorateur.

Lancashire, Cheshire and North Wales Building Trades' Employers' Federation: Half-yearly Meeting at Liverpool.

Tuesday, December 21.

Institution of Civil Engineers: Discussion on "Railway Signalling in India"; and if time permits a Paper on "The Design of Rolling Stock for Smooth-rail Working on Heavy Gradients" will be read by Mr. F. W. Bach, M.Inst.C.E.

PRIZE DISTRIBUTION AT THE ROYAL ACADEMY SCHOOLS.

THE distribution of prizes to the successful students of the year was made on Friday evening last by the President, Sir EDWARD POYNTER, and this being a "gold-medal year," more than usual interest attended the function. The Royal Academicians present included Sir L. ALMA-TADEMA, Mr. F. DICKSEE, Mr. A. GOW, Mr. WATERHOUSE, Sir ASTON WEBB, Sir E. WATERLOW, Mr. G. D. LESLIE, Mr. MARCUS STONE, Mr. DAVID MURRAY, Mr. HAMO THORNYCROFT, Mr. E. CROFTS, Mr. GOSCOMBE JOHN, Sir LUKE FILDES, Mr. S. J. SOLOMON, Mr. E. A. ABBEY, Sir GEORGE FRAMPTON, and Mr. W. W. OULESS.

The President's address dealt chiefly with the abandonment of the principle adopted in the schools in 1903, of assuming that students when they came to the Royal Academy were already considerably advanced and fully equipped for entering upon the higher phase of their education. Naturally the President's remarks applied chiefly to the School of Painting, the principal object of the Royal Academy, and referred especially to the necessity for reinstating drawing from the antique to the place from which it had been temporarily deposed.

The following is the list of prizes and prize winners:—

Historical painting, "Dives and Lazarus"—gold medal and travelling studentship (200*l.*), Marianne H. W. Robilliard.

Landscape painting, "Fishing Boats Making for Safety in a Gale"—Turner gold medal and scholarship (50*l.*), Tobias Lewis; *proxime accessit*, Hilda Lennard.

Landscape painting, "The Bole of an Ancient Oak Tree, with a Wooded Landscape Background"—Creswick prize (30*l.*), Gladys M. Clark Kennedy.

Design for the decoration of a portion of a public building, "A Hunting Scene, Classical or Medieval"—prize (40*l.*), Hetty M. Bentwich.

Design in monochrome for a figure picture, "The Angel destroying the Assyrian Host"—Armitage prizes, first (30*l.*) and bronze medal, Louisa A. E. Canziani; second (10*l.*), James Williams.

Cartoon of a draped figure, "A Female Allegorical Figure of Winter"—silver medal and prize (25*l.*), Joan Joshua.

Painting of a figure from the life—silver medals, first, Leopold L. Swain; second, Frank C. Mitchell.

Painting of a head from the life—silver medals, first, Kenneth E. Wootton; second, Madeline G. Barker.

Perspective drawing in outline (open to painters and sculptors only)—no competition.

Set of six drawings of a figure from the life—first prize (20*l.*) and silver medal, Kenneth E. Wootton; second (15*l.*), Leopold L. Swain; third (10*l.*), not awarded.

Set of three studies of drapery—silver medal, Gladys M. Clark Kennedy.

Composition in sculpture, "The Expulsion of Adam and Eve from Paradise"—gold medal and travelling studentship (200*l.*), Alfred Buxton.

Model of a design, "Hercules Wrestling with Death for the Body of Alcestis"—first prize (30*l.*), Alan G. Wyon; second prize (10*l.*), Newbury A. Trent.

Model of a bust from the life—silver medals, first, Frederick J. Wilcoxson; second, Alan G. Wyon.*

Design for a medal—no competition.

Set of four models of a figure from the life—first prize (20*l.*) and silver medal, Alan G. Wyon; second (15*l.*), James Booth.

Design in architecture, "A Nobleman's Mansion in a Large Park, with Garden Terraces Down to the River"—gold medal and travelling studentship (200*l.*), Harry H. Jewell.

Set of architectural drawings, "Greenwich Hospital"—silver medals, first, Stanley A. Tuffs; second, William H. Gummer.

Design in architecture—prize (25*l.*), Harry H. Jewell.

Perspective drawing in outline (open to architects only), "The Strand Entrance to Somerset House seen from the Courtyard"—silver medal, Judah Weinberg.

Original composition in ornament (open to architects only)—not awarded.

Set of drawings of an architectural design—first prize (15*l.*), James G. Cooper; second (10*l.*), John L. Berry.

Architectural design with coloured decoration, "One Bay of the Nave of a Church showing Arcade and Clerestory Over"—silver medal, Basil Oliver.

Landseer scholarships in painting and sculpture of 40*l.* a year each, tenable for one year, have been awarded—in painting, to Ronald H. Greig, Dorothy W. Hawksley, Tobias Lewis, Douglas G. Shields, and James Williams; in sculpture, to Newbury A. Trent and Frederick J. Wilcoxson.

* Disqualified owing to having received the same prize before.

The subject of the design for the Gold Medal and Travelling Studentship of 200*l.* in Architecture was "A Nobleman's Mansion in a large park, with garden terraces down to the river." The mansion was to stand on a level plateau 30 feet above the river and 200 feet away from it, and was to have a frontage of 200 feet towards the river facing south, with an entrance courtyard on the north side.

Mr. HARRY HERBERT JEWELL, the author of the winning design, has certainly surpassed all the other competitors in the skilful lay-out of the environment of the mansion, which, we may take it, was an essential part of the problem, the actual house itself being part only, and not a predominant part, of the scheme. Whereas many of the competitors seem to have thought that the north side was the back of the house and of minor importance, Mr. JEWELL has recognised that this is the entrance front, and that therefore the design of the approach required particular

Digitized by Google

care. By a skilful device of making stables and garage form two blocks as avant corps to the approach, and connecting these to the house by the familiar eighteenth century device of circular colonnaded loggias, the gold medallist has given piquancy and dignity to the main entrance.

In the mansion itself we find a practical as well as dignified plan, with plenty of internal effect and skilful variation of lighting of corridors and halls, by which a considerable amount of contrast in the chiaroscuro of the interior would be obtained.

The architectural detail of the design shows knowledge rather than originality, academical correctness in the use of well-worn motifs of a refined and coldly dignified character rather than vigour or piquancy.

Of the remaining seven designs Nos. 148, 150, and 153, in our opinion, come nearest to the winner; but though possessing more originality, vigour, and piquancy they have not the successful exhibition of the grand manner in planning the environment of the mansion that puts Mr. JEWELL'S work in front. Other designs are still further removed, and scarcely more dignified than would become the home of a successful trader or manufacturer.

Seven sets of drawings were submitted for the two silver medals offered for measured drawings of one of the towers of Greenwich Hospital, with one external bay to the side of the colonnade. These are of very equal merit, and the judges must have had some difficulty in awarding the first silver medal to Mr. STANLEY ARTHUR TUFFS and the second to Mr. WILLIAM HENRY GUMMER.

The 25*l.* prize for the best design executed in the School of Architecture between October 1, 1908, and July 31, 1909, has been won by Mr. JEWELL with a design for a branch bank, with offices above and a manager's house adjoining. This is on a corner site, and far more powerful in detail than the author's gold medal design. There are several other good designs among the twenty exhibited, and the freedom accorded to Royal Academy students is evidenced therein, in none, perhaps, more than in a design for a railway station in Modern German "new-art" mode.

Formal perspective drawing would not seem to be regarded with much favour by R.A. students, as there are only two competitors for the silver medal, which Mr. JUDAH WEINBERG wins easily, although with very good drawings.

The prize of 10*l.* for original composition in ornament executed in the school has not been awarded to the solitary competitor, whose full size model of a memorial tablet is coarse and lumpy, and only suitable for a position so far from the eye that the inscription could not be read.

The junior students exhibit twenty-one designs for the prizes of 15*l.* and 10*l.* for work done in the school. Mr. JAMES GOUGH COOPER takes the first with a rather clever attempt at a church tower in Greek, which has sufficient individuality while still reflecting the feeling of the Tower of the Winds and the Choragic Monument. Mr. JOHN LIONEL BERRY takes the second prize with a church tower based on the Romanesque manner, his design being in brick, with a moderate amount of stone; simple yet powerful in effect.

For the silver medal offered for the architectural design with coloured decoration of one bay of the nave of a church, with arcade and clerestory, there were only two competitors, and Mr. BASIL OLIVER scores an easy victory. The architecture is based on the Decorated period as regards mouldings and tracery, but simple and broad in treatment by the adoption of capless piers and much white stone, with a restricted amount of red brick. The principal colour decoration is a band or frieze between the nave arcade and clerestory, in which figure subjects of religious character are suggested. The windows have nearly all white glass, with mere spots of colour. The whole scheme is very satisfactory; but in execution it would scarcely be possible to find a red brick so unassertive in colour as the author shows. Mr. OLIVER'S only competitor should throw away the blue out of his colour-box before he makes his next attempt at colour decoration.

NOTES AND COMMENTS.

THE death of Mr. HENRY BAYLY GARLING, F.R.I.B.A., at the age of eighty-seven, removes one of the last survivors of the contemporaries of the great architects of the nineteenth century, of BARRY, SCOTT, STREET, and BURGES. Mr. GARLING was one of the selected competitors for the new Law Courts, though he was not then so successful as he had been in 1857, when he won in competition the first prize of 800*l.* for the best design for the new War Office, which, needless to say, he was not fortunate enough to carry out. Mr. GARLING won several notable prizes in his student days, including the Royal Academy gold medal.

THE decoration of the walls of Mansfield Street School, Manchester, by some students of the Municipal School of Art, is an example that is worthy of being copied. This particular work has been carried out at the instance of the Society of Friends of Art, with some assistance from the funds of the Royal Manchester Institution. Architects are only too willing for their buildings to show an alliance with sculpture and painting, but their clients cannot always afford the work of Royal Academicians, and the number of young students who nowadays, both in painting and sculpture, have sufficient ability and training to enable them to afford very efficient help in the decoration of public buildings is an occasion for their employment in such work as has been thus done in Manchester.

How art treasures become lost is shown by the experience of the Bangor Museum, the Museum and Library Committee of the Town Council having called attention to the discovery of a number of catalogues of old pictures. Works of REMBRANDT, RUBENS, RUYSDAEL, TENIERS, VANDYKE, GREUZE, QUINTIN MATSYS, and other famous masters were included; but the pictures have been so neglected that, from dirt and age, it is difficult to say whether they are genuine or not.

AN inquiry which Mr. H. SHELFORD BIDWELL, M.Inst.C.E., an Inspector of the Local Government Board, has opened at Bournemouth displayed a considerable opposition on the part of some residents to the Corporation's scheme for a pavilion or concert hall, reading and assembly rooms on the site of the Belle Vue and Pier Hotel, and upon land forming part of the Central Pleasure Grounds, for which the Council desire sanction to borrow 77,000*l.* Apparently the Corporation desire to make Bournemouth the Blackpool of the South Coast, which many private residents naturally do not desire. The Inspector was unable to conclude his inquiry, and adjourned the proceedings till January.

BURSLEM'S new Town Hall is not yet a certainty; but, despite the persistent opposition of a minority, the Town Council now seem satisfied that Burslem wants a Town Hall, that it can have the Town Hall, as designed by Messrs. RUSSELL & COOPER, at a cost of 25,000*l.*, and that it can afford the money. Hence a tender having been received at 24,918*l.*, the Town Council has "provisionally" approved the plans, subject to the decision of a town's meeting.

WE are glad to note from the first annual report of the Edinburgh College of Art that architectural students are taking full advantage of the benefits it offers. Omitting the general and indeterminate classification of "art students," who presumably have not fixed their future occupation, "architects' draughtsmen, apprentices, &c.," to the extent of ninety-two, exceed in number all other occupations attending the College except "house-painters, decorators, gilders, and apprentices," who number 152. In the section of architecture the diploma of the College is awarded to students on the satisfactory completion of a five years' course. It is a little curious that of forty-eight who entered in drawing only eight passed, whereas of thirty-six who entered in sculpture sixteen passed, which, unless the standard in the two subjects is very different, looks as if the architectural students need to pay more attention to drawing.

OLD LINKS GOLF CLUB, ST. ANNES ON THE SEA.

THE Council of the Club recently invited a limited number of architects to submit designs for a new club house, and appointed Mr. ERNEST NEWTON, F.R.I.B.A., of London, assessor.

Premiums of 25*l.*, 15*l.*, and 10*l.* were offered for the designs placed first, second, and third respectively. The total cost of the buildings, exclusive of lockers and other fittings, was stipulated not to exceed 3,000*l.*; but in a supplementary letter a further sum of 1,000*l.* was allowed, with an intimation that preference would be given to the approved scheme nearest approaching the sum originally specified.

The accommodation required and approximate size of the rooms were as follows:—

A locker room for men, including juniors, to contain 350 lockers, with the necessary lavatory, bath, and drying accommodation. A locker room for ladies, to contain fifty lockers, &c., with separate entrance; ladies' tea room, with floor area of 340 super feet; dining room, 840 feet super; smoke room, 650 feet super; billiard room, 650 feet super; card room, 250 feet super; committee room, 350 feet super; kitchen, stores, servants' hall, steward, small sitting room for housekeeper, and four bedrooms for staff; professional's workshop and caddie master's office.

The selected design is that submitted by Mr. W. STIRRUP, F.R.I.B.A., of Manchester and Blackburn.

On visiting the present club house to view the drawings we found the design had been taken away by the author for the purpose of making alterations to the scheme, so we are not able to enter into any description of the design, and we can only give the following notes from the report (kindly supplied by the author) which accompanied the drawings.

After inspecting the site it was concluded that the verandahs, ladies' tea room, dining room, smoke room, and billiard room ought to have an outlook over the links, and that the caddie master's room, workshop, and caddies' accommodation should be placed between the club house and the first stence.

On the ground floor is a spacious entrance hall, and locker rooms for ladies and gentlemen, with separate entrances and verandahs, the latter being distinct, and separated by the projecting front of the ladies' tea room. The kitchen and service department are also concentrated on the ground floor and completely isolated. The office is centrally situated and controls both departments. The kitchen is removed from the central rooms to avoid nuisance by the smell of cooking. A special pantry for the preparation of ladies' teas, &c., is provided, adjoining the ladies' room and the service lift. The housekeeper's room is placed so as to control the ladies' and kitchen departments.

The first floor is approached by means of a central staircase, and has a large landing, from which is entered the dining room, billiard room, smoke room, and steward's room, the latter being attached to the bar and adjoining the dining room.

The second premiated design is by Messrs. J. B. PYE & DAVID BIRD, A.R.I.B.A., of Manchester.

On the ground floor, and overlooking the course, are centrally placed the dining room, lounge and smoke room, with a verandah extending from half-way of the dining room to the smoke room. In the rear at one end is placed the men's locker room, with a direct entrance, and the lavatory, bath, and drying rooms approached therefrom. In the rear at the other end is placed the ladies' tea room (with separate entrance), with the locker room approached therefrom. In this wing are placed the serving room, kitchen, scullery, stores, servants' hall, and steward's room. On the first floor are placed the billiard, card and committee, and secretary's rooms, and the staff bedrooms.

The design is compact and well arranged, but the secretary's office might with advantage have been placed on the ground floor.

The third premiated design is by Mr. G. FRASER, A.R.I.B.A., Liverpool.

In order to reduce corridor space as far as possible, the author adopted an elongated type of plan. In the centre on the ground floor are placed the committee room, the secretary's office, with the smoke room behind. On one side is placed a large gentlemen's locker room, with a smaller locker room beyond, and beyond the locker rooms are placed the lavatory, bath, and drying rooms, &c. On the other side of the committee and dining room is the ladies' tea room, with the locker room and lavatory, and the kitchen department. On the first floor are placed the billiard, card, and dining rooms. The principal entrance hall is small, and to approach the lavatories the members would have to go through both locker rooms and then retrace their steps.

Designs were also submitted by:—G. H. WILLOUGHBY, F.R.I.B.A., Manchester; Messrs. KELVEY & PENNINGTON, A.R.I.B.A., St. Annes; SIDNEY STOTT, Oldham; F. W. MEE, F.R.I.B.A., Manchester; A. ENGLAND, St. Annes; T. T. REES, F.R.I.B.A., Liverpool; F. GORST, Blackpool; J. CLEGG & SON, Oldham; A. HINDLE, Blackpool; JOHNSON & SELLERS, Manchester; W. L. GRUNDY, W. A. SHARPE.

Of the designs of the unsuccessful competitors noteworthy are those of Mr. G. H. WILLOUGHBY, who submitted two schemes. His scheme A. was well conceived, and the elevations were, we consider, the best submitted. In our opinion the question of cost has prevented the assessor from awarding a premium to this design.

Messrs. JOHNSON & SELLERS's scheme is very compact and simple in plan, but to have produced a satisfactory building the elevations would require remodelling in their entirety.

Mr. F. W. MEE and Mr. A. ENGLAND both submitted well-thought-out schemes, with drawings well drawn. In Mr. ENGLAND's scheme the element of cost has no doubt prevented his design being placed.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. Ernest George (President) in the chair.

Mr. H. T. Hare, hon. secretary, announced the decease of the following members:—H. Bayly Garling, elected associate 1843, fellow 1857, and who was awarded the Institute silver medal in 1848 for an essay on sculpture and sculptural ornament. He gained the Royal Academy silver medal for measured drawings and the gold medal for architectural design. In 1857 he won the first premium of 800*l.* for the design for the War Office, the design being selected from among the 218 submitted. T. W. Cutler, elected associate 1873, fellow 1879. The deceased served for some years on the Council of the Institute until 1898, and had taken an active part in its affairs. G. Campbell Sherrin, elected associate 1882, fellow 1892. Mr. Sherrin served for some years on the art committee of the Institute. Although his professional work, said the hon. secretary, was familiar to many of them, it was not so well known as it deserved to be. All the buildings erected from his plans evidenced his sincerity for his art and the trouble he took to carry his designs to a successful conclusion.

Votes of condolence and sympathy were passed to the relatives of the deceased members.

Architectural Education in America.

Professor A. D. F. HAMLIN, in a lecture on this subject, prefaced his remarks with a brief retrospect of early American architecture when the most accomplished designers were amateurs. He referred to the decline in artistic taste which followed the Civil War period until 1876, when a rapid and general revival in the industrial and decorative arts was witnessed. Numerous technical schools were established, and although first attention was given to departments for mining and railway building, architectural education was also included. Although the architectural offices had often to employ foreign draughtsmen, the British system of pupilage never obtained any foothold in the United States. The youth starting his career as an architect began as office-boy, and picked up what knowledge of construction and design he could by an alert use of eyes, ears, and tongue. Yet notwithstand-

Digitized by Google

ing the absence of pupilage, it was chiefly to the system of training initiated by Hunt and Ware that the United States owed the organisation and methods of its architectural schools.

In 1881 Professor Ware was invited by the trustees of Columbia College to undertake the organisation and conduct of a department of architecture upon the same general lines as that which had achieved such distinguished success under his guidance in Boston. That the proposed department should be attached to the technological faculty of the college which had grown up around the school of mines was a foregone conclusion. The department of architecture developed into a distinct school of architecture, though under the Faculty of Applied Science of the reorganised University, it was in 1902 made an independent school with a view to its later incorporation into a proposed Faculty of Fine Arts.

The present organisation of the course recognises three classes of students: first, those who aspire to the highest achievement in the profession, and to that end seek for a broad foundation of liberal culture through non-architectural studies before taking up their strictly professional courses; secondly, those who, without this broader foundation, desire to pursue a systematic course of architectural study for three or four years and to receive a definite academic recognition of their attainment; and, finally, young men, already more or less experienced as draughtsmen in the profession, who desire to pursue special studies in architecture while unable to afford the time or expense of the complete curriculum. Students of the first of these classes enter as candidates for the University degree and diploma of Bachelor of Architecture, upon completing, either at Columbia University or elsewhere, not less than two years of serious study in the ordinary A.B. course. Students of the second category, having had no collegiate training, are admitted upon passing examinations counting ten (or, after 1910, twelve) "units," of which three must be in mathematics and one in freehand drawing, the other six being selected at will from the following subjects: mathematics, French, German, physics, chemistry, history, and English. The requirement thus technically expressed means nearly the equivalent of graduation from a first-rate non-classic high school at about eighteen years of age. The mathematics required for admission cover arithmetic, plane geometry, and algebra through the binomial theorem, series, and progressions. The English preparation required covers not only grammar and composition, but acquaintance through certified reading with a selected list of the masterpieces of literature. These two items give an idea of the scope of the examinations, which are quite searching, and are conducted by a general inter-university board in June, in a large number of centres throughout the Union, and by the University itself in September in New York only. The third group are admitted without examination upon certification of having been for at least three years employed in architects' offices or in independent practice. Men of many years' experience sometimes avail themselves of this opportunity to make up for deficiencies in their earlier training or to profit by the latest instruction in architectural history or scientific construction. Students of all these categories, without exception, must furthermore give evidence by work submitted, or by a special test examination, of a fair mastery of the elements of the five orders, shades and shadows and architectural rendering in Indian ink. Those who fail in this test, however, if otherwise prepared and admissible, are allowed to attend all class-room courses and are given a couple of months in which to make up the deficiency under this test before being allowed to join their class in the draughting room. Columbia University is the only school which requires this preliminary test in draughtsmanship and the orders, and the proportion of those who pass it satisfactorily is still small, though yearly increasing. But the results in the school of its enforcement are most gratifying, for the time spent upon these purely preliminary subjects is greatly reduced, and the student started by so much the earlier on the exercise of his creative imagination in design. Students of the second category receive upon graduation a special diploma in the form of what is called the "Professional Certificate," but they receive no academic degree, and are not admitted to candidature for the M.A. and Ph.D. degrees. Those of the third group are called non-matriculates, and receive no academic certificate, though their passing of tests in the various courses they pursue is recorded in the University registers. The curriculum leading to the degree of Bachelor of Architecture comprises the following groups of studies:—(*a*) Mathematics and engineering, comprising analytical geometry, plane trigonometry, and differential and integral calculus, mechanics, graphical statics, and architectural engineering—a specialised course in strength of materials and the calculations for masonry, columns, beams, and trussed constructions, with specific problems to be worked out in full; (*b*) architectural history, including a three years' course in the history of architecture and the history of ornament, with at least one year of reading in archæology and architectural history in French or German; (*c*) office work and specifications, comprising parallel courses in the materials and forms of building and in specifications, and a certain amount of certified work in architects' offices; (*d*) drawing and modelling, exercises occupying from six to ten hours per week through the entire period of study, in architectural draughting, modelling in plasticine, and freehand drawing, from elementary cast-drawing to life-drawing from the nude, and including a considerable amount of training in architectural water-colours; (*e*) graphics, comprising advanced shades and shadows, perspective, descriptive geometry and stereotomy; and finally (*f*) design, considered as the crowning feature of the course, the end and aim to which all other branches pursued are contributory. This course comprises lectures on the theory of planning, composition, colour, and decoration, and a graded series of problems beginning early in the first year of study and extending to the end of the course, culminating in the graduating thesis—the design of a building upon a programme selected by the student, upon which he prepares a fairly complete set of scale working drawings and specifications, with strain-sheets, calculations, and structural details of a given part of the edifice.

After many years of experiment, said Professor Hamlin, the system of training in design followed in the Columbia school had shaped itself thus.

The newly-entered student, already possessed of some slight acquaintance with the orders and of the elements of drafting, is for three or four months subjected to a further drill in these subjects, in order to be able to express himself with some freedom in architectural form. The orders are not treated as the sole language or the sole alphabet of the art, but simply as *one* form of architectural expression, and are carefully and thoroughly studied at the outset because there can be no free expression until one has mastered some one medium of expression. The remainder of the first year is then devoted to exercises in composing simple architectural structures with these elements: gateways, porches, vestibules, pavilions, and the like being the subjects assigned. The designs, carefully rendered with all shadows cast in Indian ink, are handed in at given times and criticised and judged by some member of the school staff. Upon the completion of a sufficient number of these introductory exercises—usually at the opening of the second year—the student is admitted to the lowest grade in the regular school competitions in design. There are three of these grades—the elementary, intermediate, and advanced. In each of these grades there are from five to seven or eight major problems given out during the academic year, and as many minor or sketch problems, the former requiring each from three to seven weeks for their completion; the latter one day only. The programmes for these problems are prepared by a committee consisting of the six teachers and honorary professors of design, who administer the three *ateliers* or drafting-rooms maintained by the University. The programmes are given out on a day set in the calendar, and the designs must be handed in on another set day, or they are not received at all. Shortly after this they are hung in a suitable exhibition hall and judged by a jury consisting partly of members of the committee and partly of practising architects invited *ad hoc*. The jury awards *passes* counting three "points," *mentions* counting four points, and *special mentions*, to exceptionally meritorious designs, counting five points; designs failing of a pass get no credit whatever. For the sketch problems only three or four passes, counting one point each, are usually allowed in any one judgment. A student is promoted from the elementary to the intermediate grade on acquiring nine points; thence to the advanced grade on acquiring fifteen points; and is permitted to begin his graduating thesis upon acquiring fifteen points in advanced design if a candidate for the degree, eighteen if a candidate for the certificate. The work on the thesis usually occupies two or three months.

Mr. T. G. Jackson, R.A., said a few points had occurred to him during the reading of the paper. The system of training which had been advocated, he understood, contemplated three classes of students, which he would call A, B and C. The first, A, went through a course in architecture and a course of further studies in subjects unconnected with architecture, the second qualified for a certificate of architecture only, but in time he could pass into the third class of general teaching. It seemed to him that the training in class A was based upon what to the speaker's mind was a confusion of ideas. General culture was one thing, and architectural training

Digitized by Google

another. That men should graduate in arts and study architecture afterwards was reasonable, but to treat the study which qualified for a degree as part of an architectural curriculum seemed to him to be an intellectual muddle, and he could not help thinking that the system was inspired by a motive of which there had been instances in this country of trying to give a sort of adventitious respect to the dignity of the art of architecture by investing the student with a diploma in architecture. The description was an entirely fictitious one. The second class gave a more thorough architectural training than in A, but in the last class of all they had the simple practise in architecture of a student who knew already something about the art, and this latter class Mr. Jackson thought was the most useful of all three. He was, he said, the last person to decry intellectual culture; the more a man knew the greater was his intellectual pleasure, and the greater his usefulness to mankind. But general culture would never make a man an artist. If they looked at the history of great artists, sculptors, and painters, they would find that they had mostly risen from the ranks. The story of great architects was very much the same, and in classical times many of the great architects were slaves. Then, too, when they came to the masterpieces of mediæval art he imagined they were all made by men whom they would call illiterate. He maintained therefore that intellectual training should be indirect, and suggested that there was more hope for good architects rising from the two inferior classes which carried with them no university distinction or decoration, than from the first class, which carried with it greater distinction. He ventured also to say that perhaps too much stress was placed upon technicalities and design. Mathematics might be useful to an architect under certain conditions, but speaking for himself the speaker said a knowledge of mathematics need not extend beyond the first four rules. Those rules were enough to enable one to calculate the weight to be carried, and the strength that should be provided for, and beyond that the tables formulated by humane people sufficed for all work. Then as to technicalities. He did not think it was necessary to make them all important in a curriculum. Ventilation, drainage, engineering, and electrical matters offered extremely difficult problems, and he believed the architect who was wise saw that such questions were beyond what was actual architecture, and therefore sought the advice and co-operation of those who had made such technicalities their profession.

Mr. REGINALD BLOMFIELD, A.R.A., remarked that he could not say that historically Mr. Jackson was quite right on the matter of general culture. The architects of the Renaissance were men of reasonable culture, and some at least were highly educated men. He referred to the distinction between technical instruction and education, and said it was evident that in America they believed technical subjects in architecture were a matter of liberal culture. There were two ways of looking at education, the cultivation of the mind, or the acquiring by the mind of a vast amount of knowledge. Personally, said Mr. Blomfield, he preferred as an architectural student the man with a general education and a well-trained mind, to one with an ill-trained mind. He was surprised not to find stress laid upon draughtsmanship by Professor Hamlin. The American system had undoubtedly taken its inspiration from the Ecole des Beaux-Arts, where draughtsmanship to a large extent was essential. Another point in the training of architectural students, though it hardly applied to America, was apprenticeship. It was beginning to go out of fashion in England, a fact to be regretted, for he attached importance to it, believing as he did that apprenticeship developed that individuality which marked the character of work in this country.

Mr. JOHN M. SIMPSON proposed a vote of thanks to Professor Hamlin for his paper. Professor REILLY seconded the motion, and expressed his admiration for American work, the excellence and refined scholarship of which he believed was due to the growth of the large schools of architecture with their splendid equipment.

Professor F. M. SIMPSON concurred in this opinion.

Mr. H. H. STATHAM suggested that although the details of electricity, drainage, &c., were too complicated for one man to know, yet the architect should know all the principles of the specialists.

Professor HAMLIN briefly replied, and the meeting terminated.

The Epsom Board of Guardians have adopted plans prepared by Mr. A. C. Williams for a nurses' home to be erected on the east side of Middle House, at an estimated cost of 1,870*l.*, exclusive of the architect's commission.

TOWN PLANNING CONFERENCE AT THE GUILDHALL.

ON Friday of last week a well-attended Conference was held at the Guildhall, London, under the auspices of the Garden Cities and Town Planning Association. Delegates attended from the City of London, the London County Council, fifteen Metropolitan boroughs, thirteen county councils, forty provincial boroughs, thirty-five urban district councils, twenty-five professional and propagandist bodies. After the Lord Mayor had given an official welcome the chair was occupied by Mr. Godfrey Benson (Mayor of Lichfield and chairman of the Association).

The Secretary (Mr. Ewart C. Culpin) announced that a proposal would be submitted for establishing a central body for town-planning matters which should be representative of official, professional, and propagandist bodies, and render efficient and welcome service to any department or authority. Such a body would be entirely non-partisan and without any particular theories on such questions as land ownership or taxation. The Association, as the oldest organisation on town-planning lines, will organise the proposed body, which in addition to other functions would form an effective clearing-house of housing and town-planning effort and thus prevent any overlapping or undue rivalry. He suggested that the Conference, representing as it did so important a body of expert opinion, should authorise the sending of a message of congratulation to Mr. John Burns on the passing of the Bill, which at the very least marked the beginning of a new order of things in beautifying the towns and improving the life of the people.

Mr. Thomas Adams, late of the First Garden City, Ltd., read a paper on "The Practical Application of Town-planning Powers," which we will give in our next issue. A discussion ensued, in which Mr. J. W. Willes Bund (Worcester City Council), Professor S. D. Adshead, Mr. Kirkby (City Architect, Bradford), Dr. Freemantle, and others took part.

The meeting then adjourned for lunch previous to the second half of the Conference, which it was arranged should treat the subject of town planning first from the architect's point of view and then from that of the engineer and surveyor.

Professor BERESFORD PITE, F.R.I.B.A., introduced the subject of "Architecture and Town Planning," in the absence of Sir Aston Webb, R.A. He said that in the first place he wanted to remark on the happy position that they were now in since the Bill had become an Act, and therefore at once removed from the atmosphere of partisanship and party politics. It was a suitable occasion to bear testimony to the great debt the nation was under to Mr. John Burns for his enthusiasm, political tact and power, and above all for the strong sense he had shown of architectural dignity in the city. Mr. Burns's previous work on the London County Council in connection with schemes like the Strand Improvement and the new County Hall also deserved recognition in connection with this subject of town planning. But besides Mr. Burns there were others who should not be forgotten, as, for instance, Mr. Henry Vivian, M.P., who created the movement of co-operation in dwellings. Then again, London was under an enormous debt of gratitude to its great landowners. Generally speaking, practically all their garden squares and the dignified and spacious parks, which alone made dwelling healthy and possible in this city, were due to the private enterprise and personal expenditure of individuals who were now described technically as ground landlords. What London would be without the charms of Bloomsbury, Bayswater, Belgravia and Bow, without its spaciousness and without those gardens, it was difficult to imagine. Its great squares will go down to posterity bearing names like Grosvenor, Cavendish and Eaton, and will serve as monuments testifying to the public spirit and architectural qualities of their original layers-out. It was a matter of congratulation that that private expense had now resulted in public profit.

The subject of town planning might be thus divided:—(1) Plan the thoroughfares; (2) plan the sites; (3) plan for extension; (4) plan architecturally; and (5) education on the subject. London as we know it will be perhaps so soon choked up with disabled and derelict motor buses that it will be without any thoroughfares. When that comes about the means of locomotion will be either by tubes or by aeroplanes. Half a century of railway selfishness has killed our national instinct for roadway scheming, although it was undeniable that England might be well proud of her influence in the art and science of constructing railways. But no

Digitized by Google

Londoner could be proud of a single railway bridge which crosses the Thames, or of the way in which access had been opened up to the great railway termini. Perhaps our geographical position was partly to blame for our neglect in cultivating the art of access. A glaring instance was to be seen at Dover, where the dismal tunnels and the miserable platforms formed such an inglorious entrance to the country.

In town planning it was the dumb needs of the multitude, the men in the street, that called for consideration. The planning of thoroughfares produces sites, and sites have to be created (*a*) for dwellings that shall be healthy and pleasant and, as far as possible, freehold, but conditioned by mutuality of covenant; covenants effected by legislation are less onerous and less personally restrictive than those arrived at by private owners. (*b*) Sites for public buildings. Those dignified and useful for Church and State should be central; as they bestow a certain increase of value on the sites adjacent, these would in an ideal new city belong to the municipality; there would also be a reserve of central park land for public uses. (*c*) Then would come sites for commercial purposes, such as shops with warehouses behind, and in connection with these factories, market streets and exchanges—all the streets being considered with a view to obtaining that mutual comfort and usefulness essential for commercial prosperity.

Town planning should be carried out with a view to extension—that is, for that growth which must be part of every healthy city. As with the growth of a city there is a tendency to seek for fresh air and landscape, it was to the interest of the town that such sites should be included in the neighbourhood. These inevitable extensions increase the difficulty of dealing with the central sites, and only by long prevision can they be provided for.

Then the town planning should be done architecturally—*i.e.* done with forethought, with economy, and with that sense of beauty which may be summed up in the word refinement. Architecture is the art of beautiful building, but so far the aggregate has never been considered. The best architect was he who not only considered the immense problem of a great building, but considered it as a combination of great buildings embodying each phase of the social and national life. It might well be supposed that it was too great a problem for one single mind. In a town designed by one architectural genius there would inevitably be a sense of monotony and sameness present. But at the present moment it was a subject for education rather than for doctrine. Lessons were to be learnt from many cities in this country as well as from those on the Continent. But to them London was the most educative of all. In London they could see both how to do it and how not to do it.

There were many different lines on which historical study of the subject might be undertaken. But a great opportunity had come to the present generation, and they would be reflected in the use they made of this Act.

Mr. Raymond Unwin said that in this town-planning movement they had to exercise great caution, lest in doing good they should also destroy much that was beautiful. There was in everyone a love of the city or town to which they belonged. It therefore behoved architects that in carrying out schemes for town extension they maintained local colour and the characteristic beauty. Town planning was finally an architectural problem. This contention was not meant to belittle the work of others, for it was most necessary to comply with the requirements of the engineer, the surveyor, the economist and the sociologist, who laid down the conditions under which architects had to work. But once the final stage of realisation was reached, it then became an architectural problem. The town, as we see it, is a group of buildings, the exact lines of streets being of secondary importance to the placing and massing of the buildings. It was undoubtedly true that the lines must be determined to some extent by the practical requirements; it was none the less true that the final decision of exactly how the plan is to be placed on paper must be faced as an architectural question, if anything of beauty such as the public had a right to expect was to result. The mere practical necessities, such as sanitation, had already been faced with the completest thoroughness in our suburbs; but it was because these considerations were not sufficient that the Housing and Town Planning Bill had been passed to-day. The ordinary by-laws go into great detail as to all matters of construction and sanitation, but it was beginning to be realised that something more than this was necessary if we are to have suitable dwellings, and so this Planning Bill had come into being. Into the planning of suburbs there ought to be introduced a certain dignity which will cling to people's affections in the same way as old buildings. The Bill begins at the right end, for it goes at once to those residential areas which are at present growing up round large towns without any consideration for after effects, being merely considered from the point of view of sectional and personal interest. It was time that it was begun to be realised that the individual's right place was as part of a whole, and that while striving for individuality it must also be seen that the parts contribute to the effect of the whole.

The subject might very well be divided into two divisions, viz. the planning of the main arteries and the planning of the small areas in between. Of course, once the broad lines had been laid down a great deal of detail ought to be left to be filled in by the individual initiative of those who will afterwards develop the future cities. The necessity for going slowly was exemplified in Germany, where many evils had resulted from too much being undertaken at first. The tendency towards monotony, for example, was only to be expected, since no man's ideas are big enough to fit a town which deals with many men. Therefore much might be left in the early stages in the development of site planning, it being enough if the main lines were laid down. There was one thing that the by-laws had done which needed to be carried very much further. Under the model by-laws it was not compulsory to give proper frontages to the buildings so that they may afford light and air to all the rooms. A very loud outcry was rightly raised against back-to-back houses, yet many of the houses erected in compliance with the regulations were back-to-back houses of the worst type. The question of roads ought to be gone into also. Many main roads, owing to the increase of motor traffic, are now anything but desirable for those who wish for peace. It was also absurd that a 40 or 50-foot road leading to a little group of buildings should have to be made exactly of the same standard as if it was intended to carry the utmost traffic.

Landowners had nothing to fear from the Town Planning Bill. There would certainly be a reduction in the number of houses permitted to be erected to the acre; this, however, would mean the spreading out of the city, and consequently the owners would benefit by the enormous difference in value that existed of land that was brought thereby within the margin of building land and that which is agricultural. Indeed, there was a danger that the effect of the Act would be, as in Germany, to send the values up, for it was undoubtedly true that neighbouring landowners would in course of time reap the benefit of being adjacent to well-laid-out property. Another danger was that if the owner were compelled to lay out his land in very new streets he would retaliate by erecting big block dwellings. Before setting anything on paper it was very advisable to receive all the suggestions that might be forthcoming, for once the plan is made they all come in the form of destructive criticism. It was important to remember that this matter was one for co-operation between the authorities and the inhabitants. It was to be hoped that the authorities would not follow the precedent of the by-laws when they tried to smuggle them through with the utmost secrecy and the least possible trouble. Such a course of action was only natural, as it involved less work; but it was not right, and operated very hardly on many people. It was only by co-operation between the various bodies concerned and the local authorities that the evils could be avoided and the full benefit reaped from the Housing and Town Planning Act, 1909, by which we shall build for ourselves dwelling-places worthy of rational people.

Mr. Paul Waterhouse said that, speaking as a representative of the Royal Institute of British Architects, he desired to thank the organisers for the opportunity afforded of associating architects with town planning. He suggested that all architects who are being trained in the special study of that subject would find no better learning ground than in the ancient City of London, full as it is of problems which must come in course of time to other cities. His own interest in the subject was only an academic one, being confined to a study of the way in which certain streets can be amended. It was not many years since the Royal Commission on London Traffic produced their wonderful Blue Books, but these are now almost forgotten and are being covered with dust. An excellent plan was produced, though nothing has yet happened. Perhaps it was not too late to hope that some day architectural genius might yet be brought to bear upon the work which the Commission carried so far without producing any practical result.

Mr. H. V. Lanchester, speaking on the subject of the Traffic Commission report, said that, while having every respect for their investigations, he could not help thinking

Digitized by Google

that their proposals were entirely wrong and would fail to effect any improvement. In this country, unfortunately, garden suburbs were regarded as complete in themselves instead of as part of the great city out of which they sprang. This town planning by retail could not commend itself to any architect, for in their opinion the city and its suburbs should be considered as a whole. Provision should be made for the garden city growing into an integral part of the city. In his opinion the civic parks should be laid out on lines radiating from the city's centre. Town planners should also bear in mind that the city was something to be seen from without as well as from within, and therefore they should think how it would look from a little distance. Every great and important city wanted some dominant centre like the cathedrals of French towns, and St. Peter's in Rome.

CONFERENCE ON TOWN PLANNING AT WESTMINSTER.

A CONFERENCE on the practical administration of the Town Planning clauses of the Housing and Town Planning Act was held on Tuesday and Wednesday, December 14 and 15, at the Westminster Palace Hotel, London, S.W., under the auspices of the National Housing and Town Planning Council.

The Council placed before the Congress as the basis for discussion a series of suggestions as to the most practical lines of town-planning procedure adapted to great centres of population.

The following gentlemen co-operated in the preparation of this series of suggestions:—

Professor S. D. Adshead, Professor of Town Planning, Liverpool University; Mr. John H. Barlow, Bourneville Village Trust; Professor Berlepsch-Valendas, Munich; Mr. Albert E. Cave, London; Professor Eberstadt, Berlin; Professor Fuchs, Tubingen; Professor Patrick Geddes, Edinburgh; Ober-Baurat Geusen, Düsseldorf; Mr. E. M. Gibbs, F.R.I.B.A., Sheffield; Mr. T. C. Horsfall, Manchester; Mr. Percy B. Houfton, architect, Woodlands Colliery Village; Mr. T. H. Mawson, Windermere; Beigordneter Rehorst, Cologne; M. Augustin Rey, Paris; Mr. B. Seebohm Rowntree, Earswick Village Trust; Mr. Raymond Unwin, Hampstead Garden Suburb; Oberbürgermeister Wagner, Ulm; Mr. Percy Scott Worthington, F.R.I.B.A., Manchester.

The order of the suggestions closely follow the lines laid down by Mr. John Burns, who when speaking in the standing committee of the House of Commons when the Housing and Town Planning Bill was under discussion, thus described the various stages in the preparation of a town plan:—

(*a*) The placing by a local authority of a *primâ-facie* case for the preparation of a town plan before the Local Government Board.

(*b*) The holding of a preliminary inquiry concerning the need for action.

(*c*) The authorisation of the local authority to prepare a detailed plan; the issue of provisions relating to co-operation on the part of the local authority with the owners and other persons interested in the land; and the formation, if necessary, of a joint body of local authorities, where the land to be planned is in the area of more than one local authority.

(*d*) The holding of a local and public inquiry to fully consider the plan when prepared; and

(*e*) The formal authorisation and publication of the plan, which will then be in operation until superseded by another plan.

The Local Government Board take power under clause 55 of the Act to "prescribe a set of general provisions (or separate sets of general provisions adapted for areas of any special character) for carrying out the general object of town-planning schemes."

The suggestions were keenly discussed at the two sessions on Tuesday and at the final meeting on Wednesday morning, and were finally adopted as follows:—

SUGGESTIONS.

I.

We are strongly of opinion that before the *primâ-facie* case for the preparation of a town plan is drafted, most careful consideration should be given to the following points:—

(*a*) The extent of the area to be covered by the plan; and the local authorities which should be associated in the preparation of the plan.

(*b*) The clear statement of the objects to be aimed at in the preparation of the plan, amongst which may be suggested:—

(*c*) The different treatment necessary for manufacturing and residential areas, and the reservation of special areas for residential property only; the definite limitation of the number of dwellings per acre in residential districts; the provision of parks and open spaces and the preservation of all places of beauty or of historic interest; and generally the ordered development of the town as a whole.

[After general discussion the suggestions of the committee were carried unanimously without any alteration. One of the points raised was that the Act gave too narrow an interpretation to the meaning of "areas."]

II.

For this preliminary work of inquiry we would suggest that a town planning committee should be appointed by the local authority wherever practicable, and that a limited number of leading citizens specially qualified to give advice on this point should be invited to aid in making inquiries.

[A proposal that the owners of land or speculators in land in the areas to be planned, or their solicitors or agents, should be excluded from such a committee was lost. One member pointed out that it would keep out many architects and agents. The constitution of the committee was keenly debated; some speakers advocated the introduction of co-opted members with votes, while others favoured the co-operation of outsiders without the votes. It was ultimately decided that the local authorities should arrive at their own arrangements.]

III.

The Preparation of the Primâ-facie Case.

As the consent of the Local Government Board to the preparation of a town plan will be conditional on the submitting of a well-prepared *primâ-facie* case at the preliminary inquiry, and as the decisions arrived at in the first stage will be of vital importance in stating the general grounds on which the later town plan will be based, it will be of great value to call in the services of skilled advisors to confer with this committee. These skilled advisors, in co-operation with the officers of the local authority, should be entrusted with the task of:—

(*a*) Preparing a brief statement of the actual line of town development and traffic tendencies in the past;

(*b*) Giving technical advice as to the best methods by which the proposals of the committee can be realised;

(*c*) Preparing a series of alternative suggestions giving simply the main lines of possible and desirable development.

(*d*) Preparing a contour model.

Special Note.—It is suggested that a complete plan of the existing town should be prepared showing such existing features as parks, recreation grounds, open spaces, cemeteries, unoccupied land, allotment gardens, residential, trading, and manufacturing districts; the houses erected during the last fifteen or twenty years.

It is suggested that this plan will be invaluable through all the stages of the preliminary inquiry, and that the graphic record of building developments will show the town's natural tendency of growth.

A report embodying the deliberations of the committee should then be prepared and placed before the Town Council, who will forward to the Local Government Board the *primâ-facie* case, and ask for the required permission to prepare the plan. The report should be also published so that the objects and aims of the proposed scheme may be made clear to the citizens generally, and written suggestions invited from individuals and local architectural, archæological, and other societies interested in public welfare.

[There was a general discussion on the above suggestions, especially on the proposal to call in expert advice. The town-planners of Germany had very strongly advised the preparation of contour models, which proved to be of the greatest value.]

IV.

The Preliminary Inquiry.

The Local Government Board will without doubt prepare a series of regulations relating to the scope and character of the preliminary inquiry. We would suggest that at this preliminary inquiry the skilled adviser and leading members of the committee should be called on by the town clerk to give evidence as to the need for the preparation of the plan.

[Carried without discussion.]

V.

The Preparation of the Plan.

With the authorisation of the local authority to prepare a town plan, the work of careful preparation of the actual plan will begin. For the purpose of controlling the preparation of the plan a town planning committee should be appointed by the Town Council.

Digitized by Google

With regard to the work of preparing draft town plans for the consideration of this committee, three methods might be adopted:—

(*a*) The appointment of a well-equipped expert, or experts, to prepare a town plan; and

(*b*) The use of the services of the present officials of the local authority.

(*c*) The giving of substantial premiums for the best town plan submitted in competition.

Special Note.—The general opinion of the gentlemen preparing these suggestions is that the competitive system is not the best for this purpose.

It may be pointed out that it would be inconvenient, if not altogether impossible, for the permanent officials of corporations to be consulted on matters of detail by an unlimited number of competitors.

It is also the general opinion that the preparation of the town plan should be entrusted to one or more experts—representing the architectural and engineering sides—and that throughout they should act in collaboration with the borough surveyor and medical officer of health.

[As the meeting included a very large number of municipal representatives and officials there was a considerable body of opinion in favour of the exclusive use of officials as being the persons who alone thoroughly knew the existing conditions of the locality of which they had charge. After discussion, suggestion (*b*) was inserted; and a sentence to the effect that municipal officers had their hands too full to undertake any additional burden was deleted. The case of Germany was mentioned as affording proof that official engineers were glad of outside expert assistance from an architect in preparing town plans. As a profession, an engineer's training was too severely practical to lead them to the best possible results.]

VI.

Joint Action Between Local Authorities.

The exact stage at which joint action between local authorities should be secured is a point which we recommend the Conference to discuss.

In the preparation of most town plans it will be necessary to secure joint action between two or more local authorities, viz., the council for the town, and the council or councils for the adjoining urban and rural districts. The best stage at which this joint action should be secured is without doubt that of preparing the *primâ-facie* case.

The Local Government Board have power to deal with any cases of refusal to take part in a town planning scheme, but it is desirable that from the first there should be voluntary harmonious action.

[Carried without discussion.]

VII.

The Special Objects of a Town Plan.

The general objects to be attained by the preparation of a town plan will have been dealt with in the preparation of the *primâ-facie* case. These general objects will, however, need to be exhaustively discussed by the town planning committee of the Town Council or joint committee of Councils, as the case may be, which should invite and consider suggestions from societies interested in the improvement and amenities of the town.

The following points will doubtless be recognised as of fundamental importance:—

(*a*) The extent to which the town plan shall allocate special districts for special purposes.

(*b*) The extent to which the town plan shall define the roads in the unbuilt-on areas which will be included in the town plan, *e.g.*, as to whether the method of outlining every street shall be adopted, or the method of defining the main arterial roads, leaving the detailed planning of the areas to be determined later.

(*c*) The extent to which sites for public buildings, open spaces, playgrounds and parks can be provided in the new districts, and the preservation of all places of beauty or of historic interest.

(*d*) The conditions of planning under which roadways and footpaths of less costly construction and the abolition of back streets and roadways can be permitted, *e.g.*, by the planning of purely residential streets in which the traffic facilities needed will be so slight as to render possible great economies in road and footpath construction. The practicability of adopting a system of non-traffic streets in purely residential areas should be fully considered.

(*e*) The arrangement of the houses of various classes so that they are not rigidly divided, but have equal access to the amenities to be provided.

(*f*) The limitation of the number of houses per acre and the extent to which economies in road and footpath making may be permitted in consideration of the provision by owners of larger areas for gardens on any side of the dwellings and of open spaces.

[A town clerk present questioned whether the Act empowered a committee to allot one part of the town to residential and another to manufacturing purposes. It was also doubted whether it would be practically possible to so dictate to manufacturers as long as towns depended on the rates paid by them. Other speakers contended that if they lacked the authority and the desire to effect this amenity, then the Act was almost valueless. It was ultimately agreed to ascertain from the Local Government Board if the power now existed. In dealing with clause (*d*) many speakers advocated a narrower and more economical roadway for purely residential districts. The limitation of the number of houses was only possible, it was agreed, when the exact conditions of any particular area were known.]

VIII.

Conference with Owners of Land.

When the town planning committee of the Council have decided as to the general objects of the town plan and have clearly defined these objects, conferences must be held with the owners and other persons interested in the land proposed to be included in the scheme. We regard it as, however, of fundamental importance that before these conferences take place the town planning committee should have clearly defined the objects to be achieved and have settled upon the policy which in their opinion is the most desirable one in the interests of the community.

IX.

The Public Inquiry.

In the final stage—viz., that of the public inquiry—the help of leading citizens should be again enlisted for the purpose of giving evidence as to the great desirability of the amenities which it is proposed should be secured for the community by means of the town plan.

At this stage of the proceedings the council should have the warm support of all those who desire to secure the proper growth of the town. The need for this expression of the right civic spirit by leading citizens outside the city council will be specially great during the first five years of the administration of the new Act, for in these years the tradition which will govern the practice for the next thirty years will be created.

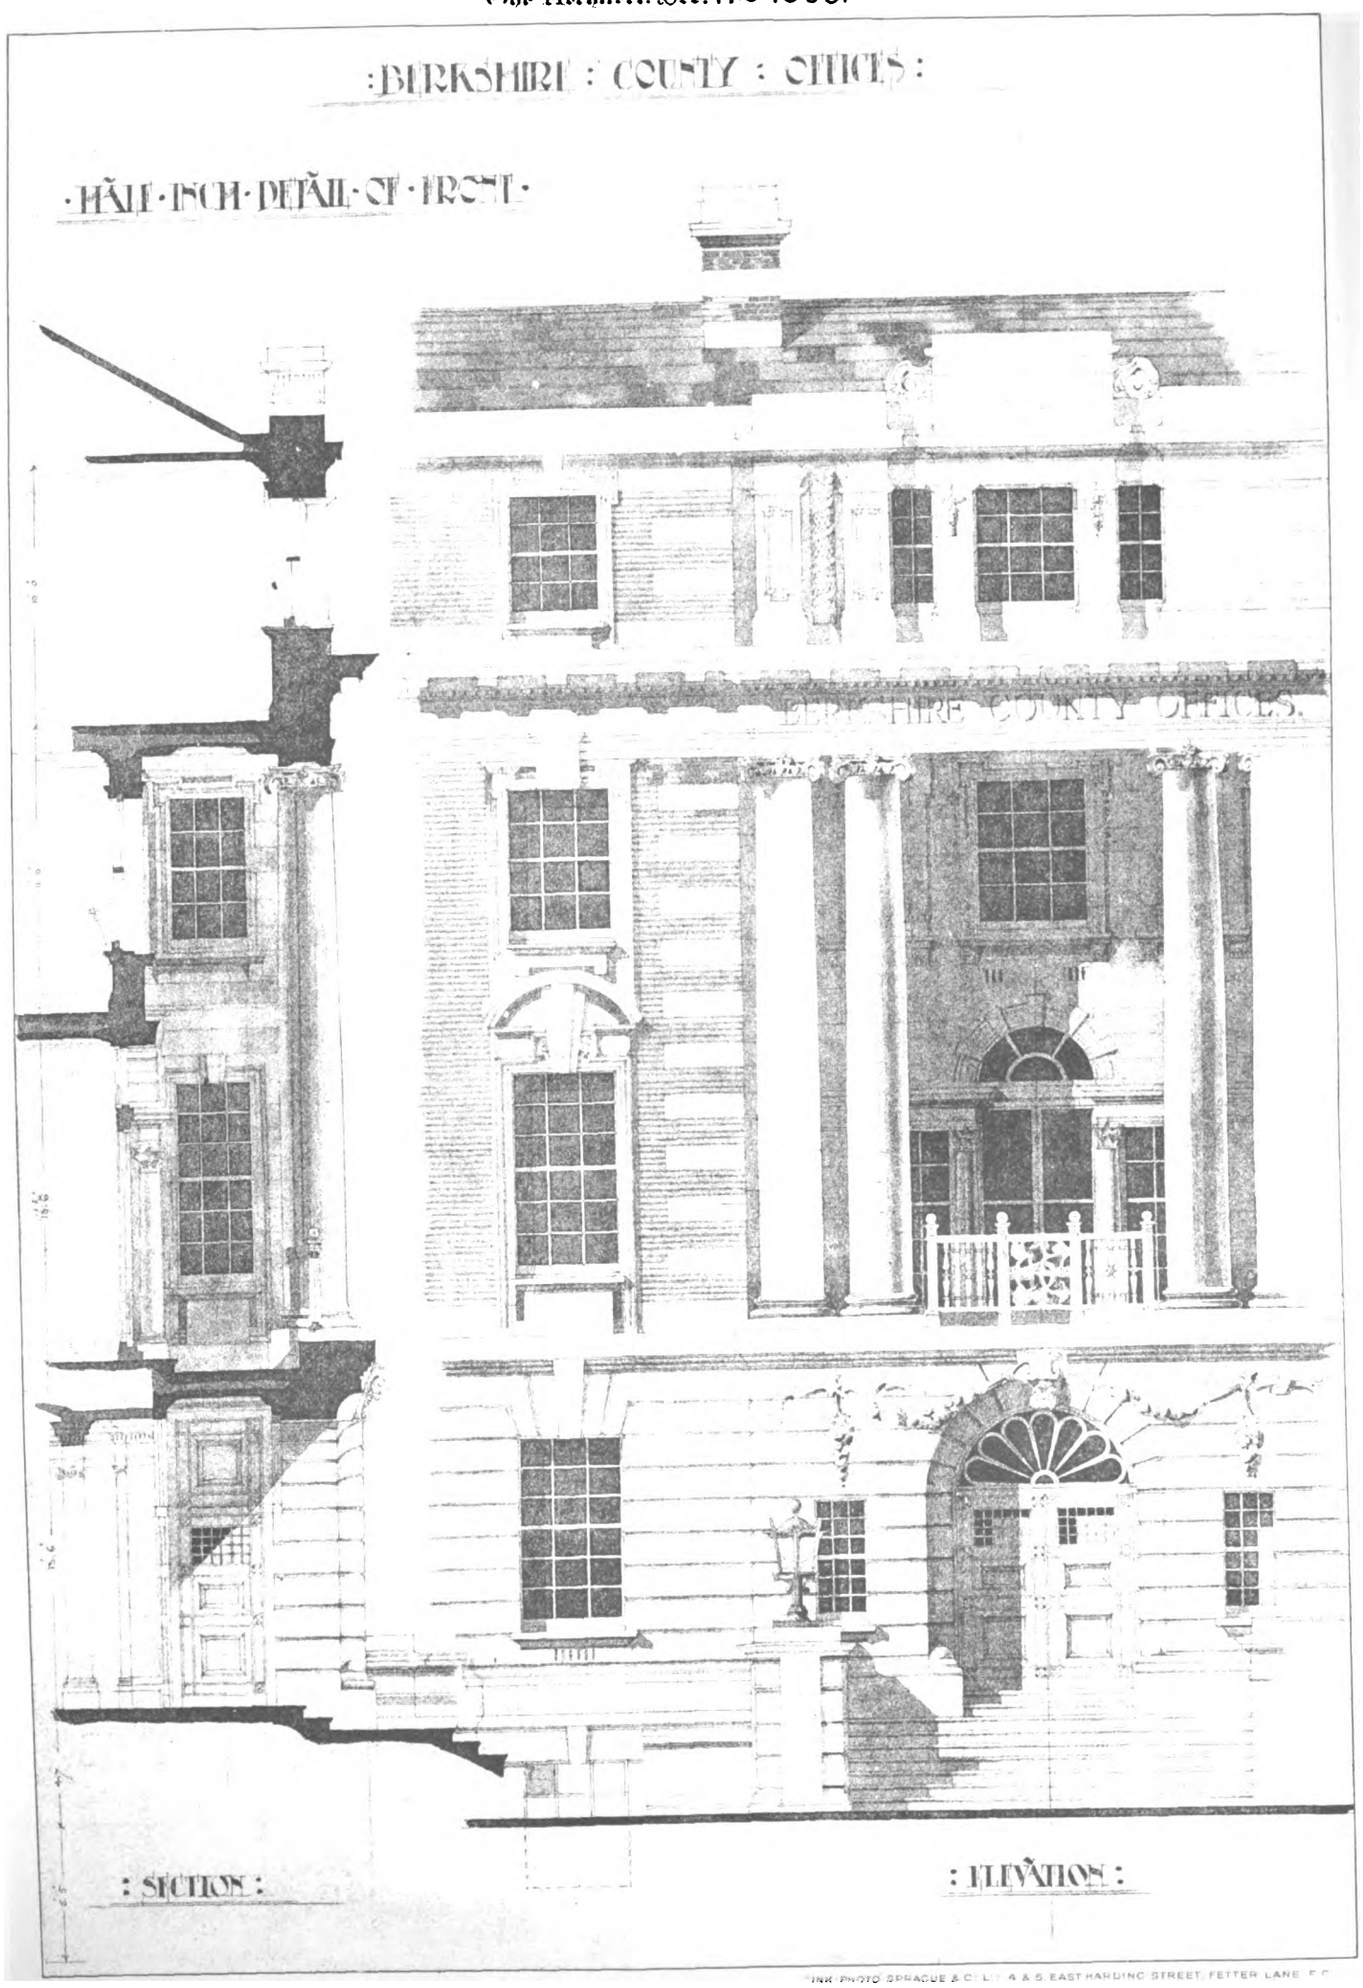
LIVING ARCHITECTS.—NO. 26, DR. A. MARSHALL MACKENZIE, LL.D., F.R.I.B.A.
NO. 27, DR. ALEXANDER ROSS, LL.D., F.R.I.B.A.

DR. MARSHALL MACKENZIE and Dr. ALEXANDER ROSS are two eminent and well-known Scots architects, but the former has also made his name known to Southrons as the designer of the Waldorf Hotel, London.

QUENBY HALL, LEICESTERSHIRE.—DETAILS OF PRINCIPAL BAYS.

THE east room of the south wing on the ground floor is described in "Nichols's History of Leicestershire" as being an unfinished room, and this may be the case, but the more probable theory is that the room was intended for and may be was used as a chapel, as there are no traces of a fireplace ever having existed in the same previous to the insertion of one brought about by blocking up the east window. Further illustrations of Quenby Hall will be given next week.



COMPETITION DESIGN FOR BERKSHIRE COUNTY COUNCIL OFFICES, READING.

THIS design, by Mr. HAROLD A. WOODINGTON, A.R.I.B.A., of 130 Jermyn Street, S.W., was submitted in the recent competition for new Council offices at Reading, and is an illustration of what might be termed central corridor planning. The detail drawing illustrates the principal entrance in Portland stone and red brickwork in narrow courses. The approximate estimated cost of this design, including alterations to existing buildings, amounted to 15,250*l*.

TOWN PLANNING.*

(Concluded from last week.)

IN connection with the new St. Paul's Bridge, which will throw a considerable stream of north and south traffic across the already somewhat congested stream of east to west traffic, at the junction of Newgate Street and Cheapside, the authorities should consider whether it would not be worth while to test the circulatory system here. If it were found possible to open out this corner somewhat, there are the makings of quite a good *place*, and the lines of three, at any rate, of the roads, and of a fourth behind the Post Office, if this could be opened up, would strike the *place* like the arms of a turbine, which would render the circulating system peculiarly easy. A carefully made test as to the usefulness of the system would be very valuable at this moment, when we are about to enter upon a town planning period in this country.

But not the least interesting type of *place* is one which we may call the garden *place*, because it is the one which is likely perhaps to be most of use to us in the planning of town extensions, the part of town planning for which alone powers are given under the new Town Planning Act.

The Schloss Platz, Stuttgart, may be taken as a good example of this type, and in passing, we may use the example also to indicate in some degree the style of garden treatment suitable to *places*. In the first slide, I have purposely hidden the central garden by the plan of the place, and I would like you to notice how the simple masses of foliage left add to the dignity of the *place*. In the second slide, the same view is given with the garden portion shown, and I think it will be agreed that much of the breadth has been destroyed by the way in which the garden space has been frittered away and worried with fountains, bandstands, and geometrically patterned beds of variegated flowers. Here is altogether too much treatment, and in forms which although, no doubt, on paper they would make very pretty patterns, do not when seen in reality from the point of view of the ordinary spectator reveal much but undue fussiness. I am convinced that the breaking up of *places* with architectural balustrades, fountains, bandstands, &c., in the great majority of cases is a mistake. Such features have their place, but they should never be allowed to interfere with the general breadth and simplicity of effect which is so necessary, and which forms so much more dignified a foreground for the buildings surrounding the *place*. A plain sweep of grass, crossed perhaps by paved footways where necessary for pedestrians, following the simplest possible lines, with avenues or masses of tree foliage, when properly placed, is generally an effective treatment, and the money spent in so-called architectural embellishments would be usually better devoted to masking one of the street entrances with a gateway arch.

Where there is difference in level in the *place*, broad terraces with balustraded walls enabling portions of the ground to be levelled, may add greatly to the effect. But in garden *places*, as in gardens, it is necessary to be very clear as to the effect that is to be aimed at, and to be very cautious about introducing any mere embellishments which do not form part of a scheme definitely thought out to enhance that particular effect. Indeed, it is not only in the treatment of places, but in the whole work of town planning that we need to guard against being carried away by the prettiness of our paper plan. While the importance of definite design and orderly treatment is undoubtedly great, it is equally true that only by building up in imagination the pictures as they will appear to the beholder walking about in the streets, can we test our different proposals. Very often things which may look simple and uninteresting on paper will be much finer in effect than other arrangements showing a much prettier paper pattern. If I have devoted perhaps an undue proportion of my limited time to the *place*, it is because I wish to-night to emphasise specially the importance of introducing a sense of scale and proportion in town plans, and because I believe that a wise use of the *place* will, more than anything else, perhaps, help us to do this. We need a centre point to our design, nay, I would rather say we need many centre points; for it is not by jumbling together many materials and styles of building that we shall produce satisfactory variety in the large areas which modern towns cover, but rather by the careful selection of suitable centre points to each town, each district, each parish, and almost to each building site, or estate. Around these centre points the plan may be grouped, in relation to them the roads would be laid out, and the widths and treatment of them to some extent graded. Around them may be gathered the local public buildings. These centre points in turn may become the pride of the inhabitants, and may tend both to give expression to, and to foster local civic spirit and enthusiasm.

For important centres where the scale seems to need something larger than can wisely be adopted for a single *place*, the useful size of which is limited within fairly narrow lines, we may well take some suggestion from the groups of *places* which are characteristic of so many continental towns and which may be planned, as for example, at Salzburg, so that not only does the group form a much larger whole and afford opportunities for seeing the Cathedral to the best advantage from many points of view, but from no point of view is it seen without its due background and frame, in that naked isolation which we are so apt to choose for our public buildings. In large, gardened *places*, where the scale of the whole would tend to dwarf the buildings, the judicious use of masses of trees may have the effect of breaking up the larger *place* into groups of *places*, partially enclosed by the mass of foliage, and in this way the proportion between the buildings and this limited *place* area may be the one that will be felt.

In Salzburg, the *places* are irregular in shape, but the same principles may govern us in planning regular and architectually treated *places*.

For the town square at Letchworth, such an arrangement has been adopted, where a large garden square seemed most appropriate for the centre of a Garden City, while groups of smaller *places* surround the main public buildings, and the streets are arranged to command a view of these. On the same slide is shown a group of *places* adopted as the central feature at Hampstead, laid out on formal lines to suit Mr. Lutyens's Renaissance designs for the whole of the buildings.

Much that has been said of *places* will apply to streets also. The building up of street pictures is indeed a fascinating art, giving scope for endless variety of treatment. When it is desired to provide a route from one point to another, and no obstacle exists, nor do the contours of the ground suggest any deviation, the obvious course would seem to be to adopt the straight line. The advantages of the straight street are that it lends itself to the production of vistas, that where suitable terminal buildings can be provided at distances not too great, these buildings can be very well seen, also the straight street affords convenient building sites, and all the many conduits, tramways, &c., which form part of the engineering work of a modern town street are more easily laid in straight lines. The disadvantage of the straight street is that it is liable to become monotonous. The Rue Soufflot, in Paris, leading up to the Pantheon, is a good example, in which the terminal feature is of sufficient importance and interest. The length of the street is not very great, and the whole forms a dignified and beautiful street picture. But where a considerable terminal feature is lacking, and where the length of the street is great, the long converging lines of windows, cornices, &c., become not only uninteresting, but wearisome. When looking down a straight street, the buildings on either side for a short distance are seen at a sufficient angle for the features to be appreciated and to be interesting; but very soon, owing to the acuteness of the angle of vision, all the features, such as windows and doors, cease to be seen sufficiently clearly to have any interest, and become mere lines of shadow. Where a cross street occurs, a small portion of this vanishing perspective is replaced by part of the side elevation of the corner building furthest from the beholder. A little point of interest is at once introduced. In the diagram given, this point is emphasised by the different treatment of the two sides of the street, and it will at once be seen that by a judicious breaking of the building line, it is possible to fill the picture with the side elevations of buildings seen nearly square with the line of vision, so that the features are sufficiently well seen to afford interest and variety. In this way, by the introduction of suitable recesses or fore-courts, which afford an opportunity for planting trees, it is possible to build up quite interesting and picturesque views on a straight street, and to avoid any large amount of the picture being filled with the converging lines of the vanishing perspective. In the case of suburban roads, where the houses stand far apart in proportion to their height, the street view may with advantage be limited at intervals by bringing some of the buildings close up to the road line, and in this way the street pictures will be greatly improved, not only by the limitation in the distance, but by the framing in of the view.

The advantages of the curved street are that it can be more readily adapted to the usually undulating surface of our sites, and that there naturally springs up along it an ever

* A paper read by Mr. Raymond Unwin before the Society of Architects on the 9th inst.

Digitized by Google

varying street picture. I cannot illustrate this better than by passing through the lantern a series of slides of the famous Oxford High Street, beginning from Magdalen Bridge, and terminating with the fine treatment of the Carfax Corner, carried out by Mr. Hare, when the increasing traffic necessitated the removal of the nave of the church. It will have been noticed from these pictures how the concave side of the street is the one that chiefly adds interest and variety to the picture, and the curved street is apt to lose on its convex side in proportion to the gain on the concave. If we examine a view of the Regent Street Quadrant, we shall see how rapidly the convex side of the street vanishes out of the picture. Comparing this with the concave side, for which I have chosen Mr. Norman Shaw's design, we shall see how the buildings on this side of the street are seen at a sufficiently wide angle for the interest of the features to be maintained right up to the vanishing point, and we may also judge of the fine effect which may be produced by a continuous horizontal treatment of a fairly regular curve. But it must not be supposed that a beautiful result necessarily follows from a curved street. There must be sufficient unity of effect and emphasis at the right points. Let me contrast a view of Holborn looking eastward, where we have a jumble of unrelated buildings and the minimum of unity, and where the curve of the street in the distance is marked by no feature of sufficient scale or interest to dominate the picture, with the Karolinen Strasse in Augsburg, where with much true variety of treatment in the buildings, a very much greater unity of effect is attained, and where the Perlach Tower and the Rathhaus beyond form a dominating feature just at the right point in the view.

I think we may say, then, that there is ample place in our town plans both for curved and straight streets, but their use should be governed by some definite purpose, and some definite effect in each should be aimed at so that we may neither carelessly continue our straight lines regardless of contours, nor imagine that we shall get a good effect by adopting aimless wriggles, merely for the purpose of avoiding straightness.

In the actual planning of our roads and streets, we cannot think only of the architectural effect to be produced. Rather, we must first think of the utilitarian purpose that the street has to serve, and find in each case such a treatment as will within the prescribed limits afford an opportunity for beautiful architectural expression of these particular requirements. While working on paper, we must always be thinking in the solid, for it is the massing and grouping of the buildings which we see and which affect our picture much more than the actual street lines; and it may often be possible to adopt quite independent lines for the buildings from those which are necessary for the road lines of the street. So important is it to consider the grouping of the buildings that after having determined in a general way the directions which roads must take to provide the necessary facilities for traffic, and to satisfy the engineering requirements, it will usually be found helpful to block out the design in buildings rather than in road lines; because within the very often fairly wide limits which would satisfy the practical requirements, the exact form may be determined wholly on architectural grounds. On residential roads much greater freedom of treatment is possible than in those solidly built up, and particularly those devoted to shopping and other business purposes, and in residential roads we encounter new difficulties, partly owing to the great width between the buildings, and partly owing to the tendency to employ detached or semi-detached units, each different from the others, producing a generally scattered effect in the areas devoted to larger houses, and to the equally monotonous plan of building long rows of smaller houses, all alike, and all alike uninteresting, in the streets devoted to smaller dwellings.

Under the new Town Planning Act it is in the ever-growing residential areas around our towns that the chief opportunity will be afforded. Centres of considerable magnitude and having buildings of fair importance will need to be provided, where whole new suburbs are growing up on the outskirts of towns; and to these the principles which we have been gleaning from the examples of different styles and periods will be as applicable as they are to those central portions of towns which are not affected by the new Act. But in all streets alike, whether residential or otherwise, we need to consider the total effect first, and the individual buildings as units contributing to that total effect. Much may be done by the careful designing of the building line to give to each street some definite character and unity, and this may be further emphasised by the adoption of definite building materials for definite streets or areas, a common roofing material being of itself enough to give a considerable degree of unity to a district. In the planting of streets also additional emphasis can be laid on the particular treatment adopted.

The tendency, which is becoming so marked, for areas to be developed by enlightened Garden Suburb Trusts, or by Co-partnership Societies, will afford opportunity for a greater degree of grouping of buildings. In streets of cottages and small villas one of the difficulties arises from the fact that the unit is so small and becomes so wearisome owing to the degree of repetition. A great improvement can be made where instead of rows of houses all alike, a number can be designed as a definite group, and this may be carried further, and three or more of such groups may be designed so that they form together a still larger group. Thus it becomes possible within limits easily practicable to create units in the street of sufficient size and importance to dominate the picture, although still composed of individual cottages each complete in itself, and with comparatively little variation in the plan and general arrangement. Such a larger group of three small groups of cottages built at Letchworth is illustrated on the screen.

With what a sense of pleasure and relief anyone wandering among the dreary ugliness that abounds in the neighbourhood of Southwark Street comes suddenly upon the little group of almshouses at the corner of Holland Street. These are as simple almost as the cheapest rows of cottages built, as they are of London stocks, relieved only by coigns; but it is the grouping of these almshouses around the simple grass court which takes approximately a cruciform shape that is so pleasing and affords such a contrast to the surrounding rows. Surely we may from such groups of tenements as these derive much suggestion for the treatment of residential buildings and roads. In these days, when the main thoroughfares are rendered dusty, noisy, and smelly by much motor traffic, it is eminently desirable that houses should be built just off the main street, and deriving inspiration from our college quadrangles, the groups of almshouses, or the closes of our cathedral cities we may, I think, add greatly to the pleasure of life in our suburbs, and to the interest of our suburban roads.

A few photographs and plans illustrating the attempts that are being made at the Hampstead Garden Suburb to work out a few of the problems connected with the grouping of buildings, the treatment of street junctions and corners, and the development of pictures in straight streets may be of interest, and will serve also, I think, to illustrate the way in which it has been found practicable there, mainly by means of suggestion, with here and there, of course, some necessary insistence, to secure a high degree of co-operation among many architects, all thinking first of the total effect, and of their own individual buildings as forming part of that total.

I want to suggest to you that fine city building which is after all the end and aim of the art of town planning is essentially a co-operative art, and indeed, I believe, the art of architecture itself is very much more a co-operative art than many people seem to think. It is more and more necessary to bring to bear upon even our individual buildings types of skill and ability seldom all united in one man, and our offices are really much in the nature of guilds turning out work which is the result of a high degree of co-operation between the principal and the assistants working with him. In the same manner, fine city building can only result from a high degree of co-operation between all the architects working on the individual buildings. Something may be done on limited areas and on private estates, as at Bedford Park or Hampstead, for example, to produce unity of effect by bringing all the buildings under the controlling influence of the ideas of one man, whose attention is centred on the whole effect rather than on the individual buildings, but these are, after all, makeshift methods. Art is not a thing easily to be controlled, and unity of effect in a whole town can only be expected when the whole of its architects are joined together by some common aim, some common appreciation of the whole effect which is being worked up to. This may seem much to expect from the present chaotic and individualistic condition of the architectural profession; but I cannot help hoping that the opportunities afforded almost for the first time in this country by the Town Planning Act, enabling us to consider as a whole, and to guide and to control the development of our towns along definite and well thought out lines planned with the due consideration for architectural effect, will so stimulate in all of us an enthusiasm for the beauty of the whole, that it will become as natural to think first of the whole, and to see our buildings in the true perspective as parts of a great street picture as it has been natural under the conditions which have held sway in this country for so many years for our attention to be concentrated exclusively on our own work. This is the right, the ideal form of com-

Digitized by Google

pulsion, the compulsion exercised upon each one of us by our zeal for some ideal which shall be shared by the whole guild of architects. We should do all that is possible in our own practice, and in the education of those who are coming forward to help us and take our places in due course, to foster this spirit, because it is only by the development of this compulsion from within that we shall be able to justify ourselves in resisting some form of compulsion from without.

Did time allow, I might suggest many other ways in which town planning is a co-operative art; notably, we shall need the help of the engineer, the surveyor, and even of the sociologist and archæologist, if we are to guide the development of our towns into lines which shall at once carry on their best traditions, maintain that unique character which gives to each its individuality, and provide adequately for all the needs of a healthy and wholesome city life. If our type of training is worth anything, it should particularly fit the architect to absorb all that is beautiful and valuable in the past, and deriving from it inspiration, to develop by the exercise of a trained imagination town extensions which shall harmonise alike with past beauty and present needs. I have taken many of my illustrations from foreign towns, because I am anxious that we should learn from many sources, but may I remind you with the last slide, that we have in this country still left unspoilt some of the most beautiful dwelling places to be found anywhere, where the work of man and the beauty of nature is wonderfully harmonised; that we have, indeed, rich tradition upon which to build.

Mr. ELLIS MARSLAND, in opening the discussion at the invitation of the President, Mr. G. E. Bond, said that on such a vast subject as town planning there must always be differences of opinion, for some would advocate one scheme and some another. In his opinion Karlsruhe was one of the finest examples; Vienna was likewise most important, for there the latter-day principles of town planning had been grafted on to what had been done before. In England also architects would have to take towns as they were and develop them on some such lines as were to be seen in Vienna. He differed from what Mr. Unwin had said as to the sense of enclosure being the special characteristic of the mediæval *place*. In his own opinion rather the contrary impression was aimed at by their designers.

Mr. E. C. P. MONSOR thought that everyone present must feel that they had learnt a very great deal from the paper. Mr. Unwin had taken them through a large number of Continental towns as well as showing what had been done at Hampstead and Letchworth. Some people might not agree altogether with the work that was being carried out; but on the whole it was excellent, whether the movement was concerned with the housing of the poor or the middle-classes. It was a grand thing that the people should get the best possible value for their money in health and in hygienic surroundings.

Mr. FREDERICK LITCHFIELD insisted on the all-importance of the financial aspects of the movement. Unless people found the requisite funds no houses could be built for them to live in. Architects should bear in mind that their art was a co-operative one. It was more difficult to bring this truth home to the mind of the profession than it was to overcome many existing obstacles. It would be most advantageous if those architects who disapproved of what had been done would come together and arrange a garden suburb which would be free from all those defects. There was a large scope of usefulness, as it was estimated that three million houses were required. An instance of what could be achieved by co-operation was afforded at the Hampstead Garden Suburb, which had been commenced only two and a half years ago. There was room for a lot more of the same careful planning on the edge of the great cities.

Mr. STEWART put in a word for the claims of the surveyor as helping towards the solution of the town planning problem. Surveyors had always dealt with considerable areas, while architects were more accustomed to confine their attention to individual buildings. Up to the present architects had certainly been more prominent in taking up the subject. It was to be hoped that surveyors would not delay in also turning their attention to it.

Mr. CHESTERTON saw in these schemes of town planning a grave danger of a loss of individuality, since people would get in the way of occupying the sort of houses which they were told to do. Town planning was a matter of personal opinion rather than an exact science.

Mr. RAYMOND UNWIN, in replying to the short discussion, said they could not expect everyone to agree with what they did, for they were little more than beginners. Town planning was the work of both surveyors and architects. The surveyor and engineer were most necessary, but when it was desired to get architectural expression, then the architect should be left in command after being furnished with the necessary practical details. There certainly was a danger which had to be guarded against of a possible loss of individuality. But that was no reason for not attempting the solution of the problems. They would learn to define the limits within which each individual should work. The truth was that the proper meaning of the word variety had been lost, or rather come to be erroneously defined as a lot of different things being put together. Whereas variety was really a certain amount of variation from a fixed type; if that principle was departed from, jumble resulted. The individual architect and the town planning architect had to work together if the best results were to be obtained.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. C. Wontner Smith, Vice-President, in the chair.

The HON. SECRETARY announced that a Life Class, under the direction of Professor E. Constable Alston, would commence on Wednesday, January 5, 1910. He also stated that Mr. Edward S. Prior would open his course of lectures on "European Mediæval Architecture" on January 12, at 6 p.m.

On the motion of the CHAIRMAN a vote of condolence and sympathy was passed to the widow and family of the late Mr. G. Sherrin. The deceased had been a member of the Association for nearly forty years.

Mr. F. C. EDEN read a paper, illustrated by lantern views, entitled "Varallo, Orta, and Varese."

Whether we have seen them or not, he said, we all know something of the big things of Italy, and of the works of her great masters in architecture. Possibly in our less heroic moments the big things are apt to seem hackneyed and the big names to pall, so that it is a relief occasionally to turn our backs upon all the grandeur and to dwell for a while on lesser themes.

I propose, then, to bring before you this evening a series of small and hitherto almost unnoticed buildings, the work of obscure or unknown architects, and will ask you to accompany me to a part of Italy which is not famous for any achievement in great architecture, but where the stones cry to us in the vernacular of a district that lay somewhat apart from the main trend of contemporary thought. Varallo, indeed, speaks but the rude patois of a sequestered valley. By the lake of Orta we may listen to the strain of true lyric grace, while Varese tells its story in unmistakable prose, a little turgid and artificial as befitted the times, but not without interest.

If you draw a line across the map of Italy westwards from the town of Como, twenty miles will bring it to Varese, situate among the low foothills just where the mountains fade away into the great Lombardy plain. Go miles further on, after crossing the lower arm of Lago Maggiore it will pass through the town and lake of Orta, and at a point some sixty miles from its starting-place Varallo is reached, in the deep and wooded valley of the Sesia, a river which rises among the glaciers on the western flanks of Monte Rosa. The connecting-link between these three places is that each possesses a noted sanctuary in its Sacro Monte, or Holy Hill, and it is more particularly of these sanctuaries and the buildings which they comprise of which I propose to speak. Imagine a grassy and undulating slope on a wooded hill, dotted with chapel-like buildings that gleam among the tree trunks, or stand out white against the sky, imparting a character of architectural romance to the whole mountain-side. Provide them with porticoes under which are grated view openings to the interior, vary the plan, size and design as fancy directs, and you have the general appearance of a Sacro Monte.

Let us begin with Sacro Monte of Varallo, that being, so far as I am aware, the first thing of the kind to be attempted. Its inception was due to a Franciscan friar, Bernardino Caimi, of noble Milanese family, who had been appointed Commissary of the Holy Places in Palestine by Sixtus IV. He returned home in the year 1481, and partly in grief at the neglected condition in which he found the sacred sites, partly with the wish to edify those of his countrymen who had not the opportunity of travel, determined to found a New Jerusalem in his native Lombardy, to contain, as its central object of pilgrimage, a replica of the Holy Sepulchre. Careful search among possible sites indicated the hill that overhangs Varallo as the most convenient for his purpose; and the foundation-stone of the Holy Sepulchre Chapel was laid in the year 1491. Caimi

Digitized by Google

started with the idea of reproducing the Holy Sepulchre, and probably certain other holy places, as Golgotha and the Grotto of the Nativity. But as the work proceeded the idea developed into commemorating the events of the Sacred Narrative by groups of life-sized figures, so that there are now forty-four chapels upon the Sacro Monte. We call these little buildings chapels for want of a better word, but they are not built or fitted for religious functions of any kind, but solely to shelter these groups of painted imagery which form in conjunction with their frescoed backgrounds tableaux of the Redemption story. Samuel Butler (whose "Alps and Sanctuaries of Piedmont" is one of the most delightful books of Italian travel) conjectures that the original idea of these representations, in which painting and sculpture are combined with the realism of a scene on the stage, may have been suggested to Caimi by the great innovator Leonardo himself, who was in Milan at the time the scheme was projected. But in truth the whole idea was essentially mediæval, akin on one side to the miracle play, and on the other to the groups of coloured figures familiar to us in the altar-pieces of Northern Europe. In the earliest examples the figures are of wood, the latest are of stucco, but those of the best period are of terra-cotta. All are painted—nearly all, alas, repainted!—by the nearest house-painter or professor, which comes to pretty much the same thing, with rouged cheeks and staring eyes. For canopies, hangings, and so forth, real drapery is introduced, and the figures have wigs of hair or dyed flax. There is no shirking realism so far as it may be had.

The first sight of these groups is certainly something of a shock. There is a sense of theatrical convention, of self-defeating realism; of the lifelessness that comes from arrested movement, as of a stage full of paralysed marionettes. This is the first impression. But if we complain of staginess, we must bear in mind that this is an attempt to put a scene upon a stage. It is a perpetual miracle play, a mediæval mystery without words or action. This intention must be recognised, and its resultant conventions accepted before we can judge fairly of the way in which it has been realised. It is both easy and obvious to talk of wax-works and Madame Tussaud. All coloured sculpture, even that of the Greeks, is obnoxious to this form of criticism. But what is really at fault in the majority of the groups is the coarse and tasteless repainting which they have undergone. Nor have time and weather been much kinder than the house-painter, and the scaling, blotching, and blistering of the paint, especially of the flesh tints, and the secular incrustations of dust and dirt, have given some of the figures "a diseased and mangy look," as Butler says, "so that there is not a chapel which does not require some effort of the imagination before the mind's eye can see it as it was left by those who made it." But, after all, the strongest motive for suspending judgment and looking a little below the surface is the respect due to the great artists who took part in these works, viz. the three brothers D'Enrico, of Alagna, the great Fleming Tabacchetti, and Gaudenzio Ferrari himself; the last of whom "ranks as among the few purest and most accomplished artists of the very culminating period of Italian art; so that what he thought good enough to do may be worth our while to consider with the best attention we can give to it." Such at least is the opinion of the eminently sane critic I have just quoted. However, it is not my intention to discuss sculptures, and I have only said so much because it was impossible to speak of the chapels without alluding to that for which they exist. At Varese and Orta we may leave the contents of the buildings out of count altogether, but at Varallo there are both frescoes and sculptures which undoubtedly take a high place among the works even of that great period, the Cinquecento.

The Sacro Monte rises precipitously to a height of about 500 ft. above the little ones, and is approached by a paved and well-graded path overshadowed by the chesnuts with which the flank of the hill is covered. When the top is reached the first impression is a bewildering one, as of an inconsequent and haphazard jumble of chapels. But even when many hands and many minds have laboured on a piece of work, and at long intervals of time, that is not the Italian way. As a matter of fact, buildings went on at irregular intervals during a period of two centuries and more. Over forty chapels had to be huddled on to a small, irregular, and *accidenté* piece of ground; they had to be approached in a certain order, and no architect of repute, except the rather second-rate Alessi and Tibaldi, were employed.

When the sanctuary was first projected it was doubtless impossible to foresee to what an extent the scheme would develop. So it came about that as new chapels were founded from time to time they were built on convenient spots, with due regard to æsthetic requirements, but without much consideration for the chronological sequence of the events commemorated. Towards the close of the sixteenth century Tibaldi was commissioned to prepare a plan to remedy this confusion, and though little or nothing in the way of building can be attributed to him, the arrangement of the connecting path by which the chapels are linked in their proper order seems to have been his. The sinuosities of the path are far more judicious than the serpentine meanders of the Jardin Anglais, and there is much of the characteristic charm of the Italian garden in the lay-out, in which we include the length of time required to find out how small the area of ground covered really is. The path, of course, is cobble-paved with cross ribs of granite to afford foothold where the gradient is steep. It is bordered with trim hedges of box and beech; clipped shrubs and stone seats are set in the right places, and the chapels themselves supply points of interest at every turn of the way. The walls are plastered, the columns and dressings of grey granite, a combination equally charming and appropriate whether among the bleak Breton moorlands or on the wooded slopes of these riant Alpine valleys. Much, of course, will depend upon the texture of the plaster, and we may trust the Italian even now to get an interesting surface in that material. The fine stone slabs with which the roofs are covered would suffice to confer a sort of dignity upon the meanest shed. Owing to the absence of coursing they have a curious appearance of having been thrown helter skelter on to the roof, and though doubtless they lie closer than they seem to do, and there must be no little method in the madness of their laying, it is not easy to see how they manage to exclude the searching snows of winter. In beauty of colour and texture these roofs excel, if that were possible, the stone roofs of the Cotswolds, and to one looking down from the Sacro Monte upon the huddled houses of Varallo, the little town seems clothed in mouse-coloured velvet, with an occasional patch of tiling to give the effect of rose-coloured rivers.

In the erection of the chapels two systems of planning have been followed. The earlier were built upon a simple quadrilateral plan, divided by a screen into two compartments, the inner for the sculpture, and the outer for the accommodation of the pilgrims. In the later examples the entire space is given to the representation, and an external portico is attached to shelter the spectators, with grilled openings to the interior. The screen is often the most interesting part of the building. The upper part is usually glazed with nice old glass of pleasant tint and texture. Below is an oblong grille of carved wood, the upper part sometimes canted to afford a comfortable view of the wall and ceiling paintings. These wooden lattices are a peculiar feature of Varallo, as the iron grilles are of Orta.

The highest point is a rounded knoll, the summit of which is occupied by the chapel of the Transfiguration. This is a huge plain drum 40 feet in diameter and of considerable height; in itself bald and unsatisfying. But charming contrast is afforded by the porch with its delicate coupled columns and interesting entablature; and it should be borne in mind that these chapels are not so much isolated objects as parts of a composition. The architects of the seventeenth century at their worst were usually good scene-painters, who thoroughly grasped the art of grouping and of producing striking effects. It was probably their feeling for scenic propriety which led them to adopt the circular or polygonal plan whenever they had to build a chapel on an eminence. Orta and Varese supply numerous examples of this preference.

The concluding chapels of the series are grouped together near the edge of the precipice overlooking the town, so as to form a sort of piazza. One side is occupied by the large church of the Assumption, and the other three by a picturesque medley of chapels, cloisters, and loggias. The church has an intolerable modern façade, gaudy and pompous; in most unpleasing contrast to the quiet beauty of the rest. Three large chapels, containing respectively the Nailing to the Cross, the Crucifixion, and the Deposition, form an important group in the south-east corner. They are raised partly on a lofty substructure, partly on the native rock. A loggia extends along the front, approached by a flight of steps at either end. The first and last contain notable works by G. d'Enrico. In the Crucifixion chapel both sculpture and paintings are by Ferrari. "No finer works of their kind have been preserved to us," says Butler. Be this as it may, no one who knows Saronno, or has even glanced into the Church of St. Maria delle Grazie at the foot of the hill, will doubt that he is in the presence of a really magistral work—devout, manly, and dignified. As you turn from this you are faced by the light colonnades

Digitized by Google

of the Scala Sancta, an imitation for pilgrimage purposes of the Roman original, by which we may ascend to the upper cloister to enjoy another view over the piazza, and a wonderful outlook through the clairvoyées at the back up the valley of the Lesia, with Monte Rosa's snowy summit closing the distance.

Taken as a whole, the chapels of Varallo must be pronounced inferior in delicacy and refinement to the best of those at Orta, and in grandeur and scenic picturesqueness to those at Varese; but in simplicity, variety, and skilful grouping they are hard to beat. Moreover, and this is perhaps their greatest merit, they are entirely suited to their situation and use. The gentlemanly elegance of Orta and the pomposity of Varese would alike have been out of place amid these sunny Alpine pastures, where such beauty alone need be sought as comes from that harmonious blending with nature which ever rewards the unaffected use of those materials which come readiest to hand.

(To be concluded.)

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT a meeting of the Society on Thursday evening, December 9, Mr. Butler Wilson, F.R.I.B.A., delivered a lecture on "Cuthbert Brodrick," the architect of the Leeds Town Hall.

In a comprehensive survey the lecturer touched upon the salient features of a remarkable career. Born at Kingston-upon-Hull in 1822, Brodrick was in 1837 articled with Mr. Lockwood, architect, of that town. On the expiration of his articles he visited the Continent for purposes of architectural study and spent much time in Italy, whence he derived inspiration for his subsequent work.

It was at Rome in 1844 that he first met the late Mr. H. B. Garling, F.R.I.B.A., who was, it appears, an intimate friend of Brodrick. Upon his return from his "grand tour" in 1845 he commenced practising on his own account, and in 1852 obtained the commission for the Philosophical and Literary Society's buildings in Hull, this being his first important work. In 1853 he was instructed to proceed with the plans for the town hall to be erected in Leeds, his design having been placed first by the assessor, Sir Chas. Barry, in a competition in which he defeated his late master, Lockwood. This building, although one of his earliest works, reflects perhaps more of his genius in its bold handling of the Grand Classic manner than any other, and it is noteworthy in that it has provided the "motif" for at least three other town halls—those of Bolton, Morley and Portsmouth. Other examples of his work are the Leeds Corn Exchange and Institute—the latter, a monumental treatment of a small front; Hull Town Hall, the Wells House on the Ilkley Moors, and the Scarborough Grand Hotel.

With Barry, Street, Owen Jones, Penrose, Cockerell, and others, Brodrick was invited to submit designs in the ill-starred National Gallery Competition, while his design for a new Custom House at Bombay, to involve an outlay of 270,000*l*., was placed first, a distinction for which he received 3,000*l*. from Lord Palmerston's Government as the project was never realised.

Elected a Fellow of the R.I.B.A. in 1870, he became a member of the Council of that body in 1874.

His active practice seems to have but covered some sixteen years—1852-68—a large portion of his time after the latter date being spent in Paris, where he experienced the rigours of the siege. Later he lived in quiet retirement at Neuilly, and his closing years were spent at "La Collene," Jersey, where he died in 1905.

As with many another great name, Brodrick's had been exampled as that of a failure, even to his having died in poverty; on the contrary, always in comfortable circumstances, he died in his eighty-third year, leaving the not inconsiderable fortune of 11,000*l*.

In conclusion, Mr. Wilson acknowledged his indebtedness to those who had supplied him with much valuable material in the form of sketch books, drawings, and facts bearing upon Brodrick's life and work.

The lecture was admirably illustrated by a series of eighty lantern slides and a unique collection of original drawings by Brodrick, many of which were exhibited for the first time.

A cordial vote of thanks, on the motion of Mr. Marshall, seconded by Mr. H. S. Chorley, F.R.I.B.A., was accorded to Mr. Wilson.

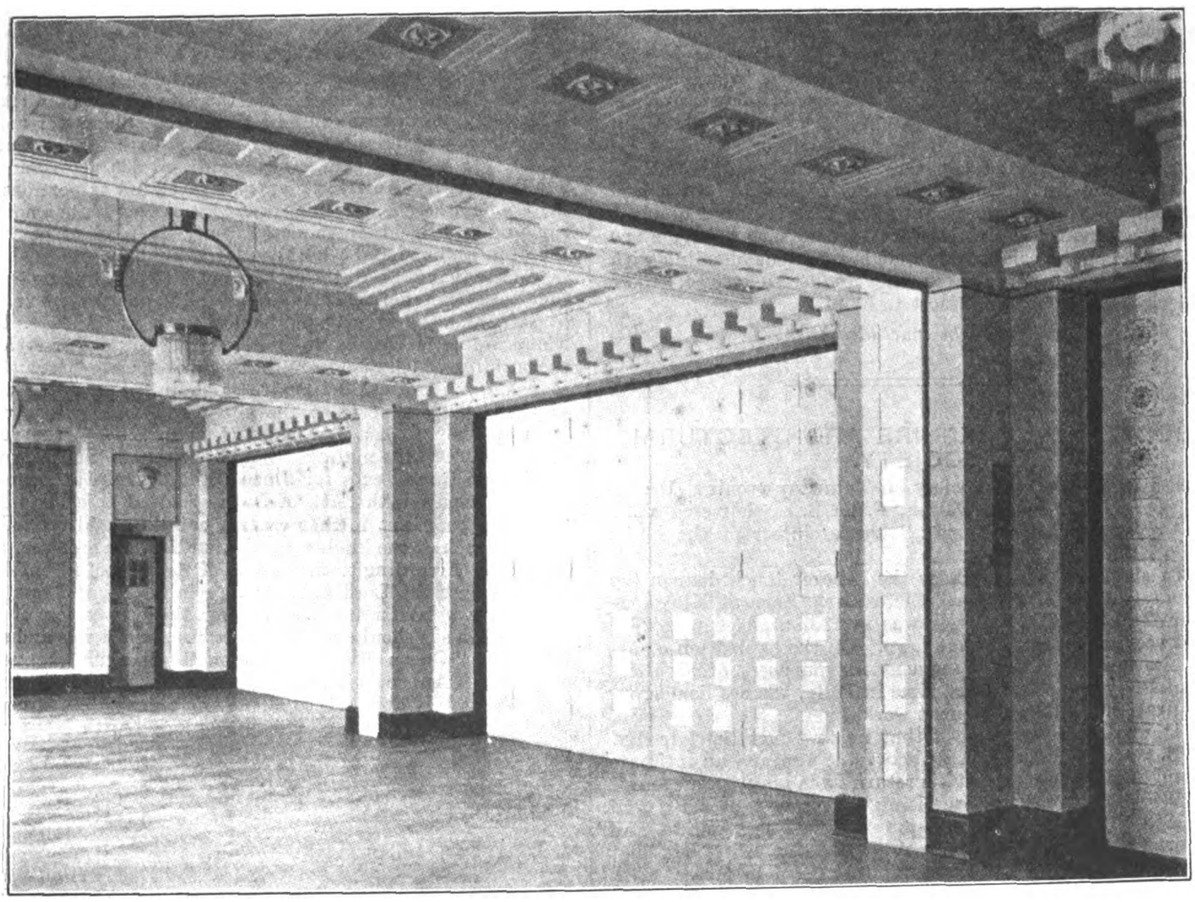
The next general meeting of the Society will be held on Thursday, January 13, when Professor S. D. Adshead, of Liverpool University, will read a paper on "Town Planning."

COBHAM, KENT.*

FOR more than six hundred years the lords of the manor of Cobham have resided upon the site of Cobham Hall. When John de Cobham died in March 1300 his manor house at Cobham was described as a messuage with garden worth 6*s*. 8*d*. per annum. The lands comprised 585 acres and no less than eighty-five free tenants in gavelkind as portions of the Cobham manor, paying to the lord assized rents amounting to 10*l*. 10*s*. 4*d*. in money, seventy-six head of poultry, 170 eggs, and one and a half coulter annually.

In the year 1327 all the goods and chattels belonging to the first Lord Cobham in this manor house and parish were valued at 16*l*., and the subsidy paid upon them was 1*l*. 11*s*. 11*d*. There are no records whatever respecting the size or style of the building which then formed the manor house. The existing mansion, built of red brick with stone dressings, is the work of three distinct periods; the north and south wings were built by the two last Barons of Cobham between the years 1584 and 1603; the main portion of the central building was erected by Inigo Jones for James Stuart, Duke of Lennox; the third and fourth Earls of Darnley added an eastern face and some bedrooms to that central building, and erected or rebuilt much of the kitchen square, stables, coach-house, and corridor. According to the custom of the period, in building such a house the Lord Cobham especially designed one fine room in a commanding position for the occupation of the queen when she should deign to visit him, and it was and still is called "Queen Elizabeth's room," although she never entered it. Approaching the Hall from the north one is struck with the stately appearance of the two Elizabethan wings of the building; they are of red brick pierced with large rect-

COBHAM HALL, KENT.



angular windows framed in stone and flanked on the east and west by octagonal turrets. The grand entrance is in the middle of a covered corridor. Entering through the doorway we pass beneath the arms of Queen Elizabeth, and passing up the hall see on our left a huge sarcophagus of red granite, 10 feet long and six tons in weight, originally formed for a bath. Ascending the grand staircase, on the right is the picture gallery, 133 feet long and 24 feet wide; upon the walls hang the gems of the Cobham collection of pictures. Among the great artists are Rubens, Titian, Holbein, Velasquez, Guido, Vecchio, P. Veronese, Tintoretto, Vandyke, and many others. Over the vestibule and library are State bedrooms, which were occupied by the Princess Victoria and the Duchess of Kent when they visited Cobham. From the vestibule we enter the elaborately gilded music-room or hall, 32 feet in height, 50 feet long, and 36 feet broad. The walls are completely lined with veined white marble, the upper portion is decorated with elegant designs and brilliant with gilding; at the north end over the doorway is an organ gallery supported by marble columns. It is interesting to notice the resemblance between this noble hall and the still more stately pile erected at Hatfield by Robert Cecil, Earl of Salisbury. William Brooke, Lord Cobham, was his father-in-law, and it cannot be doubted that Cecil gathered many ideas for the plan and details of Hatfield House from what he saw at Cobham Hall.

The dining-room, which is 50 feet long and 24 feet wide, contains a handsome marble mantlepiece of the Elizabethan

CORRIDOR TREATMENT IN THE ARTISTS' CLUB, DRESDEN.—Rudolf Bitzan, Architect

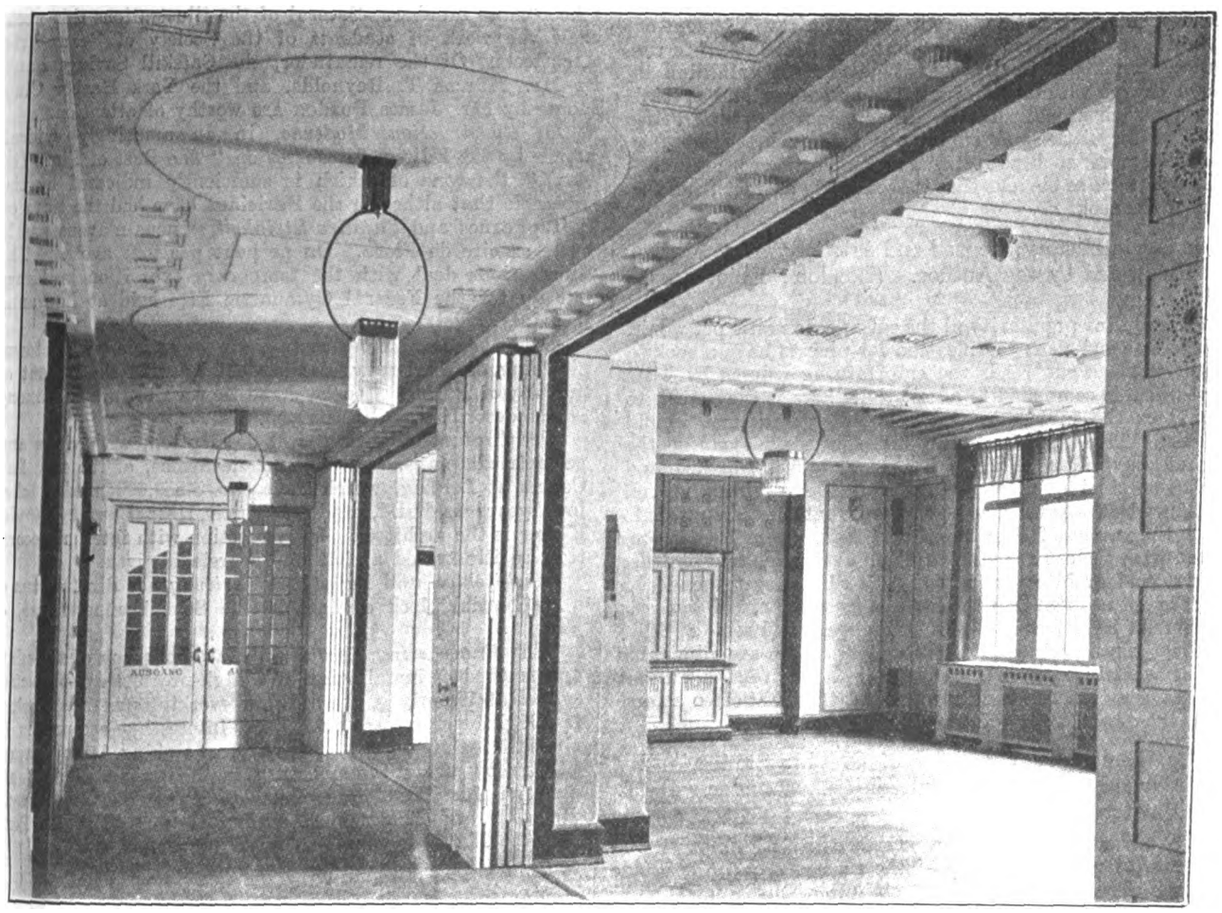
age reaching to the ceiling, some fine portraits framed as panels on each side of the fireplace, and many others adorn the walls—one of Mary Queen of Scots with the scene of her execution in the background. The library, which was formerly the chapel, contains an elegantly designed mantlepiece of yellow marble reaching nearly to the ceiling; the shields emblazoned in the window of this room are those of the fourth Earl Darnley.

The village of Cobham is situated on the top of one of the downs of the chalk formation which characterises the district. It probably derives its name from this feature, as the prefix "cob" signifies "head" or "top," and is an analogue to the German "Kopfheim." The church is large and dedicated to St. Mary Magdalene, and consists of nave with aisles, a spacious chancel, and an embattled tower at the west end; the oldest portion of the structure is the chancel of Early English architecture, finely proportioned, and belonging to the first part of the thirteenth century, and lighted by five lancet windows on each side. The church is distinguished above all others as possessing the finest and most complete series of brasses in the kingdom; it contains some of the earliest and some of the latest, as well as some of the most beautiful in design. There is an interest also in the fact that for the most part they refer to one great family; the latest memorial is an altar-tomb of great beauty near the altar; there are also some brasses to the memory of the Masters of the college. The family of Cobham, which took its name from the village, first comes into notice in the twelfth century, when one Cerlo de Cobham was possessed of property in the parish of Cobham. His son Henry purchased the manor of Cobham, with the marshes of Bulham and Swanford, from William de Quatermere in 1208; it is supposed he was one of the Crusaders present at the siege of Acre in 1191. He held the office of Lieutenant of Dover Castle, and died in 1225. History reveals the fact that the lords of Cobham rendered an unbroken succession of services to the State at the most critical periods of English history, and that John de Cobham, the "founder," must be placed among the most eminent statesmen of his time. He died on January 10, 1407. On the south side are three sedilia and a piscina of great beauty of design which belong to the second half of the fourteenth century; in the chancel hang two fine specimens of tilting helmets of Sir Reginald Baybrooke and Sir Nicholas Hawberk.

William Brooke, Lord Cobham, was the eldest son of George Brooke, Lord Cobham, and he had erected the magnificent tomb in Cobham Church to the memory of his parents; he emblazoned nine of the eleven armorial quarterings to which his mother was entitled—she died in September 1559—and he celebrated her praises in some Latin verses which have been translated by Mr. Reginald Cust, the husband of Lord Darnley's sister, Lady Elizabeth:—

Sprung from the Brays, to Cobham's lord allied,
Worthy to bear two names of ancient pride,
Here Anna lies, a lady chaste and fair,
Blest with her children's love and husband's care.
Large her estate, but of ample store,
Large was the share allotted to the poor.
'Twas in the last sad year of Mary's reign
That first the husband, then the wife was ta'en.
In life united each to each did turn,
In death they share the same sepulchral urn.

NOTES ON BOOKS.



"The Cathedrals and Churches of Belgium." By T. Francis Bumpus. (London: T. Werner Laurie. 6*s.* net.)

PROXIMITY to England, readiness of access, the small size of the country and the number of important towns and cities at no great distance apart, the excellent railway system, and above all the number of pictures by noted masters to be found in the churches, have combined to make Belgium a

Digitized by Google

MODERN EUROPEAN ARCHITECTURE.

GERMANY.

[From *Moderne Bauformen.*

CORRIDOR TREATMENT IN THE ARTISTS' CLUB, DRESDEN.—RUDOLF BITZAN, Architect.

favourite ground for the British tourist. Hence there is value in a book which, without being too technical, is instructive to the layman, and points out what is the position of the ecclesiastical architecture of Belgium in the domain of art, what are the peculiar characteristics of its cathedrals and churches, how they have come to take the particular form and treatment that is theirs.

But while the lessons that Mr. Bumpus teaches in an easy and, so to say, conversational manner that makes his writing pleasant reading to the least instructed in the technicalities of architecture, are invaluable to this class of reader, the professional student will find guidance and direction of a no less useful character, particularly should he be wishing to specialise his studies in some one by-path of ecclesiastical art.

We may not perhaps be always ready to agree with the views that Mr. Bumpus expresses, as, for example, that vaulting with bare red brick is a more "true mode of decoration than if covered with plaster and polychromatic painting or that glass-painting, *peinture en apprêt*, is an improvement on glass-staining and leading or mosaic method of earlier times."

The scheme of the book is good. First a historical sketch of the political life and architectural development of the country, then a chapter on the furniture and decoration of Belgian churches, followed by a description and criticism of the cathedrals and churches of some of the most important towns and cities of Belgium—Tournai, Courtrai, Ypres, Bruges, Ghent, Malines, Brussels, Antwerp, Louvain, Aerschot, Liège, Oudenarde, Huy, Lierre.

Throughout the book, which is well illustrated, Mr. Bumpus continually diverges to bring into comparison other churches than that he is at the moment describing. This, a valuable feature, particularly makes us lament the want of an index, the only fault we have to find, and which we regret the more as it would add to the character of an eminently readable and instructive book that of a most valuable work of reference.

"The Architect's Directory and Specification Index for 1909." (New York: William T. Comstock. $3 net.)

A complete list of the architects of the United States, Canada, Cuba, and Porto Rico, and of the landscape and naval architects of the United States and Canada, cannot fail to be of value to many of our readers, and the ninth edition of Comstock's Directory claims to contain this, besides particulars of the architectural societies and organisations of the world, architectural schools in the United States, building departments and architects to Boards of Education in the principal cities of the United States and Canada. We are somewhat surprised to learn that there are no more than 6,523 firms of architects in the United States and 779 in the Dominion of Canada, although we are aware that in the States large offices with an army of assistants are far more general than with us.

"Valuation of Real Property: a Guide to the Principles of Valuation of Land and Buildings, &c., for various purposes." By Clarence A. Webb, P.A.S.I. (London: Crosby Lockwood & Son. 7*s.* 6*d.* net.)

Although no one can learn to be a valuer by merely reading a book, the young surveyor who aspires to be an expert valuer can learn from a good book much of the principles and methods of valuation, by a knowledge of which he will be the better fitted to appreciate the lessons that experience alone can teach. The work which Mr. Webb has produced will be most valuable to the young surveyor, and explains very clearly and fully the general principles and practice of valuation. First, the nature of freeholds, leaseholds, life interests and sinking funds are explained, and their valuation elucidated. Then the valuation of land and buildings separately, in connection with which are some useful and reliable figures of the cost per foot cube of various classes of buildings. Valuation for mortgage is a branch which young

Digitized by Google

architects and surveyors are very likely to find come in the way of their early practice, and the pitfalls that await the inexpert valuer are well and forcibly pointed out. Other sections of the practice of valuation with which the author deals are timber, arbitration, compensation for compulsory purchase, rating, taxation, death duties, enfranchisement of copyholds, compensation under Licensing Act. 1904, fire insurance. Thus practically the whole field of valuation is covered except valuations of special businesses and special property, such as old masters, departments in which principles go for little and experience for much. Some few printer's errors, such as mortgagor for mortgagee, need correcting, but are so obvious that they scarcely detract from the value of the book.

"The Cat in History, Legend and Art." By Anne Marks. Illustrated by the Author. (London: Elliot Stock. 6*s*. net.)

The peculiar popularity of the cat as a domestic pet would seem to be a sufficient justification for puss to have a book to herself, and as one reads the entertaining volume by Miss Marks, one is compelled to admit that there is very much to be said on the subject in regard equally to history, legend and art. The important part filled by cats amongst the ancient Egyptians as an object of religious worship and symbol of vital principles or attributes of divinity is well explained by the author, who also points out the disrepute into which the animals fell in the Middle Ages. The legends connected with the cat are many and interesting as told by Miss Marks, and architecture is not omitted amongst them. In art it is but natural that the cat as a general part of domestic life should have frequently been depicted, and some of Miss Marks's own drawings of incidents in cat life are admirable and completely depict feline character and expression without the exaggeration and tendency to caricature that often accompany the presentations of other artists.

"The Elementary Principles of Graphic Statics." By Edward Hardy. Second edition. (London: B. T. Batsford. 3*s*. net.)

The second edition of Mr. Hardy's little book, with the addition of matter treating of the reactions of walls under oblique thrusts, B.M. under oblique thrusts, and wind pressure on pitched roofs, further enhances the value of about the simplest and most concise introductory manual to the study of graphic statics that we have. Commencing with an explanation of the possibility of carrying out the simplest rules of arithmetic by graphic methods, not as a piece of pedantry, but as a good introductory exercise, the book gradually leads the student on through the fundamental doctrines of the triangle and parallelogram of forces to the consideration of funicular polygons and so on to the calculation of bending moments and stresses in framed structures, carrying these as far as those simpler forms of roofs to which reciprocal diagrams are applicable without resort to the aid of the method of sections.

"In English Homes. The Internal Character, Furniture and Adornments of some of the most Notable Houses of England, accurately depicted from Photographs specially taken by Charles Latham." The Letterpress edited and an Introduction written by H. Avray Tipping, M.A., F.S.A. Vol. III. (London: *Country Life* and George Newnes, Ltd. 42*s*. net.)

The most attractive feature of "Country Life" to most architects has been, and is, the remarkable series of illustrations of the old mansions of England, and therefore no doubt many will be glad to have in separate form the volumes in which the illustrations and descriptions of these houses are gathered. The present volume, as we are told in the introduction, deals especially with English homes of the period from and including Inigo Jones to Sir William Chambers, and is thus intended to show us "how English Palladianism arose and developed, what men introduced and practised it, where the most typical examples of the style in its varying aspects are to be found."

The uniform excellence of representation and care in selection of salient features that has characterised the original articles in "Country Life" is therefore here maintained. The introduction by Mr. Tipping is a clear and careful explanatory thesis on the subject of English Palladianism, its rise and culmination. It is needless to say that the large scale and clearness of the photographs renders the volume as valuable to the professional student as any book without geometrical drawings can be, whilst it is at the same time attractive and sufficing for the amateur.

OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* has a continuation of the article on "Consideration in School-house Design," by Professor A. D. F. Hamlin, which was commenced in the special school-house number. Several of the illustrations this week show the work of students of the Society of Beaux-Arts Architects. Of the remainder, the Catskill Savings Bank by Mr. Marcus T. Reynolds, and the York Harbor Club House by Mr. James Purdon are worthy of attention.

La Construction Moderne, in an amusingly cynical article by the Editor, discourses on "The Bust of Flora (in wax)," the tone of which is sufficiently indicated by the preamble that although the Parisians have had the tiara of Saitapharnes and *l'affaire Steinheil*, "nous n'avons pas le buste en cire de Flora. On ne peut pas tout avoir." The illustrations deal with the temporary exhibition buildings put up for the Federal Gymnastic Fête held at Lausanne last July.

Deutsche Bauzeitung commences an article on the town-planning of Karlsruhe, dealing chiefly with the lay-out of the Haydn Platz. Modern domestic architecture in Saxony is also described and illustrated.

Der Profanbau gives a full description, with views and geometrical plans, sections and elevations, of the new Law Courts at Leipzig, which have cost 3,230,000 marks, taken four years to build, and of which Herr Baurat Theodor Kösser is the architect. In connection with internal decoration an illustrated article on Intarsia is given.

Architekten und Baumeister Zeitung has illustrations of a residential block of flats in the Schönbrunnerstrasse, of Vienna.

The *Engineering Record* gives a description of the plant and method of installation of a high-pressure fire-protection system at Winnipeg, the ordinary working pressure of which is 300 lb. per square inch. An interesting account is included of the method adopted for sinking large concrete pillars by the "Compressol" method in a difficult soft stratum for the foundations of a power-house for the Roessler and Hasslacher Chemical Company at Perth Amboy, N.J.

GENERAL.

Mr. George Campbell Sherrin, F.R.I.B.A., who died last week, was well known to a large number of London architects, and combined the *rôles* of both a metropolitan and provincial architect of very extended practice. To enumerate all his many works would be difficult, for we remember hearing him say that at one time he had more than sixty in hand at once. Amongst the more important of Mr. Sherrin's works were Spitalfields Market; St. Mary's Church, Moorfields; Woburn College, Weybridge; the dome of Brompton Oratory; and several station buildings for the Metropolitan Railway Company.

Mr. T. W. Cutler, F.R.I.B.A., whose death was also announced at the last Institute meeting, was well known for the character of his domestic work, hospitals and hotels, and greatly esteemed for his genial personality.

Mr. John Lanham Hollis, J.P., of 18 Trinity Place, Windsor, builder and contractor, of the firm of Hollis & Sons, left estate valued at 18,126*l*.

Mr. James E. Saunders, J.P., of Lee and 4 Coleman Street, E.C., architect and surveyor, left estate of the gross value of 8,983*l*.

Mr. F. A. Clark, architect, Plymouth, has prepared plans for County Territorial Association headquarters in Plymouth estimated to cost about 3,500*l*. The building will be of two storeys and with a length of 120 feet. The plans have just been officially adopted.

The Financial Board of Cambridge University have issued a report on the endowment fund and on the cost of maintenance of the new buildings. The board are disposed to think that before any further buildings are sanctioned provision should be made for their maintenance by the investment of a capital sum proportionate to their cost. They think this sum should cover the cost of rates and taxes, external repairs and insurance, and they estimate that these would amount annually to something over 1 per cent. on the capital outlay. If so the minimum to be invested to provide for these charges would be more than one-quarter of the cost of erection.

The Will of Mr. Henry Cooper, architect, of Waterloo Place, King's Road, Reading, has just been proved at the amount of 8,510*l*. 4*s*. 8*d*. net.

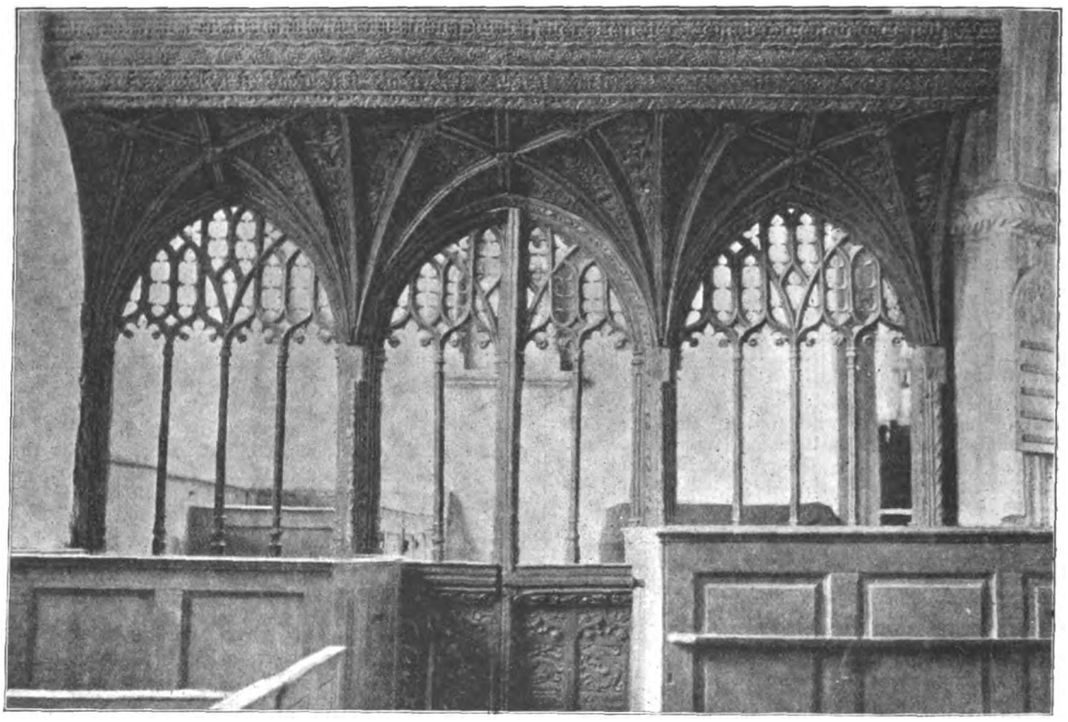
ROOD-SCREENS AND ROOD-LOFTS.

OF all the accessories that went to make up the completely furnished mediæval church there is scarcely one which occupied a more conspicuous position than that of the rood-screen, whether with or without the rood-loft as its accompaniment. By reason of this conspicuous position as well as of the ritual and symbolic importance of the screens, they naturally became the object of the bestowal of some of the best skill of the craftsmen, and of the loving devotion of the artists who worked to make the church at once the great repository of the beautiful and the centre of sanctity to the parishioner of the Middle Ages. Though much has vanished from the churches of England of the exquisite screen-work of former times, by decay and neglect, by mistaken religious zeal, and by unappreciative "restoration," the two thousand and more examples of screen-work that remain in England and Wales furnish opportunity for yet another handsome, interesting, and instructive book upon the subject.*

The magnitude of the theme, as well as their own personal experience, has probably led the authors to present a rather one-sided view of the screen-work of England and Wales, for the two volumes give an altogether undue prominence to the work of the West Country to constitute the book a conspectus of the rood-screens and rood-lofts of English workmanship, and the amateur of ecclesiastical art who might expect to learn what English screen-work means might easily overlook the slight acknowledgment that the authors make of the merits and importance of other localities. It is true that East Anglia is mentioned as one of the three districts pre-eminent for the possession of choice wooden screen-work, and placed first, we will admit, before the South-West and the Welsh Border, and if the reader will refer to the excellent comprehensive list and note the number of examples to be found in the Eastern Counties, he may perhaps draw the conclusion that as regards number of examples, East Anglia is justly included amongst the notable districts. Both authors admit the superiority of the painted decoration to be found in the East, for we are told that "whereas those of Norfolk are refined works of art, frequently of a masterly character, their effect heightened with gold and with the relief of embossed designs, those of Devon are mostly of rude and conventional design, coarse in execution, yet picturesque in their ugliness, and very valuable in their antiquarian merits and their symbolic interest." Again, it is said, "As regards the artistic value of the paintings in Devon it must be admitted that, as a rule, they fall far below the standard of the East Anglian screens. There is none of that exquisite diaper-work, those backgrounds powdered with flowers and arabesques, those intricate and elaborate patterns in raised gesso-work, blazing with burnished gold, that we find in such wonderful profusion on screens like those of Ranworth, Cawston, and Barton Turf. Nor are the figures of the Saints so well drawn as a rule, or so richly vested in robes of elaborate brocade."



The book which Mr. BLIGH BOND and Dom BEDE CAMM have produced consists of two distinct parts, a the historical essay, and even intimates that his colleague down to the Post-Reformation period, and a description of all the remaining examples in Somerset, Devon, and Cornwall, particularly full as regards those of Devon. Whilst we acknowledge with gratitude the thoroughness with which the authors have dealt with the screens of the South-West Country, we feel it necessary to point out that the comparative neglect of those of East Anglia prevents their work from taking rank as a complete account of the rood-screens and rood-lofts of England.

Mr. BLIGH BOND accepts the sole responsibility for the historical essay and even intimates that his colleague and he are not in accord on all points as to the views therein expressed of the origin of screen-work. Mr. BLIGH BOND's theory is briefly that the use of screens grew up along two concurrent lines of development, exhibited in the two types of church plan from which was evolved the final form of the mediæval church in England, the Romanesque basilican type and the Celtic square-ended type, which latter the author suggests came direct from the East, and possibly through the medium of Phœnician traders. Both lines of development are presumed to start from the early practice of consecrating the elements in the Eucharistic service by a celebrant hidden and separated from the laity by a veil or veils, a point of ritual adopted by the early Christian Church from Jewish custom. The rite of veiled consecration fell into disuse between the seventh and twelfth centuries, and the veil disappeared save for its employment during the season of Lent. Hence as a division was still required between the laity in the nave and the clergy in the sanctuary, screens took the place of the veil.

Mr. BLIGH BOND traces the line of development in the basilican church plan as showing the use of, first, veils only, then of rails or barriers in addition, next of *cancelli* or lattice-work enclosure combined with veils, and afterwards themselves forming the division between laity and clergy, and so developing into screens. From the basilican church plan Mr. BLIGH BOND also derives the

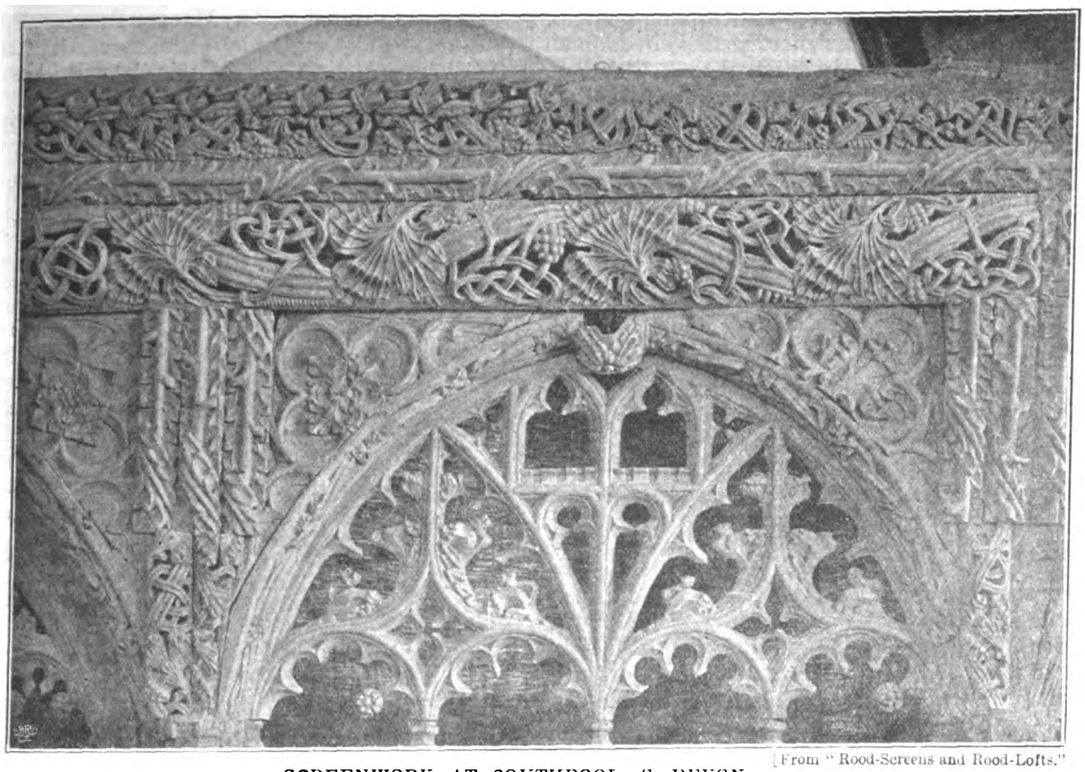
* *Rood-Screens and Rood-Lofts.* By Frederick Bligh Bond, F.R.I.B.A., Hon. Diocesan Architect for Bath and Wells, and the Rev. Dom Bede Camm, O.S.B. In two volumes. (London: Sir Isaac Pitman & Sons, Ltd. 32*s.* net.)

Digitized by Google

SCREEN AT MARWOOD, N. DEVON. [From "Rood-Screens and Rood-Lofts."

use of a triple arcade as the structural division between nave and chancel from basilican churches such as Rochester, Reculvers, Brixworth, and St. Pancras at Canterbury. His sequence of development is, however, broken by his admission that "from the seventh down to the twelfth century any authentic specimen of the triple choir-arcade is hard to discover." He admits also that in other churches of basilican type the triple arcade did not exist. We should rather lean to the opinion that the existence of this feature in Romano-British or Romanesque basilican churches and in thirteenth-century work does not involve any causal connection, but is a coincidence based on similar conditions of symbolism and convenience.

Our author's theory of the development of the triple arcaded choir division from the Celtic type of plan appears to us to have a greater element of plausibility. Chancel arches of such small dimensions as the 3-feet width at Bradford-on-Avon and the 4 feet 3 inches at Upton, Bucks, were clearly admirably suited to the mystic rite of veiled consecration, and when this was dropped nothing would be more natural than to pierce the walls at the side of the narrow arch with hagioscopes, of which our author gives us several examples. Such an arrangement would also be convenient for the provision of Jesus altars, especially in small or aisle-less churches. The gradual enlargement of the hagioscopes either to an arch equal to the central and original one, as at Capel-le-Ferne and Bottisham, or to an arrangement of small traceried openings as at Winterbourne Monckton and Curdworth, would readily be followed by the lightening of the original wall above as at Sandridge, and then of its omission as at Highway, and so we have a division between laity and clergy which is purely a screen and nothing more.



Whilst we may recognise this as a plausible theory, it must be remembered that as far as we know the number of churches with the Celtic type of narrow chancel arch was, in England, small in comparison with those that followed the Romanesque model with wide chancel opening when the great revival of church building took place at the beginning of the eleventh century, and we should be disposed rather to assign the form of our chancel screens to a development from the *cancelli* of Romanesque churches in Italy.

Mr. Bligh Bond, in our view, attaches too much importance to the "triple choir-arcade," and goes too far in asserting "that the tendency has always been in favour of a type of chancel partition in which arched openings, three in number, are set in a solid wall," and that "in England the triple division, the arcuated form, and the maintenance of the upward enclosure were never lost sight of." We fancy that he has been too much influenced by the occasional occurrence of a triple-arched arrangement in Devon, for he gives us as an example of the "West Country type" Marwood in North Devon, in which the *motif* is clear. But his book illustrates very numerous examples even in Devon in which there is no indication of an arcade limited to three or suggestive of three main divisions. Certainly no such restriction prevails to any considerable extent in East Anglia nor we believe even in Devon, let alone the West Country as a whole. In our observation the screen may consist of three, five, seven, or more main divisions, and though the central one with the doorway may be and often is emphasised by substantial mullions or door posts, which were required as much from structural necessity to carry the doors as to emphasise the entrance to the chancel, this can scarcely fairly be claimed as connoting a symbolic division of the screen into three main divisions.

The account given of the iconostasis of the Greek Church, the jubé of the Continent, and the rood-loft of England is more descriptive and less controversial than that of the origin and growth of the rood-screen, and if we adopt the usual view that these features are lineally descended from the ambones of the Early Christian churches, it is easy to follow Mr. Francis Bond's theory that the screens were the development of the supports of the rood-beam and loft. For ourselves we cannot accept this theory, as the mediæval rood-beams did not require intermediate support, and if they had would have found that of the screen altogether insufficient.

Of the description and illustration of the screens of Somerset, Devon, and Cornwall nothing can be said but praise, whilst Part III. of the book, which deals with the figures painted on the panels of Devonshire screens, with an alphabetical list of the Saints and other personages depicted, is a most valuable contribution to the iconography of English screens. The illustrations are well

SCREENWORK AT SOUTHPOOL, S. DEVON.

chosen and excellently produced, and put clearly before us the superiority of the West Country woodwork. The respective merits of East and West in respect of screenwork can be put in a nutshell. East Anglia for colour, the West Country for carving. Whilst we regret that Mr. BLIGH BOND and Dom BEDE CAMM have not been able to do justice to East Anglia, we feel that the thanks of all who are interested in English ecclesiastical art are due to the authors for their able and complete exposition of the screens of Devon and the adjacent counties of Somerset and Cornwall.

NOTES AND COMMENTS.

THE present Editor of *The Architect* desires on this the first occasion that at this season of the year the paper has been under his direction to offer to all his readers his best wishes for a Happy Christmas, and to hope that neither the "flu" or other ailment, nor the depression of business has hit them so hard as to prevent them from following the inclination to be of good cheer. He also wishes to thank his numerous friends and acquaintances in the architectural profession for their encouragement, their sympathy, and their assistance in carrying out the duties of his new *rôle*, and particularly those who, by permitting him to illustrate their drawings and buildings, by their contributions, and by their advice or suggestions, have done so much to lighten his labours and to render them more pleasant. Although it has not always been possible up to the present to adopt the advice or suggestions given, these have always received serious consideration, and will continue to do so.

WE are pleased to note that Mr. THOS. G. JACKSON, R.A., has followed the lead we have given in these columns and lent the support of his powerful influence, *apropos* of the LUCAS or LEONARDO wax bust, to call the attention of the general public, in a letter to the *Times*, to the "*reductio ad absurdum* of the ways of dealers and collectors at the present day" that this incident exhibits. It behoves all true friends and lovers of Art to use every endeavour to open the eyes of the wealthy Philistine to the manner in which he is being exploited by the dealers in antiques. It is an excellently pretty game, and a profitable one—to the dealers—to run up the prices they give for antiques to fabulous figures, safely relying on the assurance that someone will buy from them at a percentage of profit. Of course, the higher the price the bigger the percentage, but one hardly credits the American millionaire, who falls into the trap, with the smartness that one would naturally suppose was his qualification for gathering the millions. One cannot do better than repeat the words of VASARI that Mr. JACKSON quotes, "Things modern are as good as things old, provided they be excellent, for it is mere vanity in those who run after names rather than deeds. Men of this sort are to be found in every age, who take more account of appearance than of reality."

THE present inflated prices, though an excellent thing for those who are in the swim, must be hitting somewhat severely the lesser lights amongst the dealers in art who have not huge capital behind them, and we would suggest that the present is a favourable time to work a little boom in moderns, on a lower plane, but on similar lines, to those of the princes of the business who work with antiques. After all, there are not a great many men, even in America, who can spend a million dollars on one picture; but there are plenty who would exult, vain-gloriously if you like, in paying a score of thousands for a modern picture. Yes, there is money to be made by the skilful work of *agents provocateurs* in rousing the vanity of the *nouveaux riches* to the delight of paying high prices for works by modern artists.

WE congratulate Mr. J. W. SIMPSON on the Report of the Committee on the Law of Copyright, which has just been issued, for we consider that it is largely due to his able advocacy that we read, "The Committee, by a large majority, have come to the conclusion, after due consideration of the evidence, that it is desirable to recommend that architecture be accepted as matter to be protected, both for the sake of uniformity and because it deserves to be protected, and presents no difference in principle from that applicable to the sister arts." We hope to deal more fully, on a future occasion, with the subject of copyright in architecture as affected by the Report of the Committee on the Law of Copyright.

THE custom of decorating streets at Christmas time to attract buyers to shopping centres is becoming general. Doubtless because it is the first effort in this direction on the part of the shopkeepers in High Street, Clapham, there is absent the spirit of appropriateness in their scheme. Ascending High Street the first premises are respectively, on the right hand and left hand, a public-house and a pawnbroker's. Stretched between, and attached to each, there is a huge banner inscribed "A Happy Yule Tide to all our Patrons." Is this meant to point the cause and effect?

THAT clay may be a "mineral" sometimes is clear from the judgment of the House of Lords on an appeal from a decision of the Court of Appeal affirming the judgment of Mr. Justice EVE in the case of the Carpalla United China Clay Company, Ltd., and Viscount CLIFDEN *v.* Great Western Railway Company, that china clay is a mineral under the Railway Clauses Consolidation Act, 1845. The solution of the conundrum, "When is clay a mineral?" depends, therefore, on its rarity and its specific value as a variant from ordinary or common clay.

AN important decision has been given by the Tribunal of Appeal under the London Building Act, 1894, in respect of the building line of the Euston Road between Hampstead Road and Osnaburgh Street. As most of our metropolitan readers know, the actual frontage line of the street here is formed by a heterogeneous collection of buildings brought up to the pavement apparently by building over the forecourts or gardens of houses that at one time stood back a considerable distance from the road, and so producing about the most higgledy-piggledy piece of street architecture that London can show. The Superintending Architect of the London County Council defined the general line of building as a continuous line from Hampstead Road to Osnaburgh Street, about fifty feet from the edge of the pavement all along, which, from an architectural point of view, would have been admirable. The Tribunal of Appeal has, however, to consider law as well as, or rather in preference to, æsthetics, and, no doubt with reluctance, has come to the conclusion that for part of the distance only can they support the Superintending Architect's line, that for part the buildings front to Osnaburgh Street and the Hampstead Road, and that for the remainder there is no general line of buildings. This results in absolute chaos. We understand that there will be a further appeal against the decision of the Tribunal.

THE Mayor of Liverpool entertained on Saturday last a number of friends of the project now carried to a successful issue, of decorating four lunettes of the main hall of the Town Hall with pictures by Mr. J. H. AMSCHEWITZ, representing the granting of the charter to the borough by King JOHN, Liverpool as a centre of commerce, Industry and Peace, Education and Progress. The funds were provided from the surplus of the pageant held in 1907, and Mr. F. J. LESLIE, Chairman of the Pageant Committee, performed the ceremony of unveiling, Alderman RADCLIFFE accepting the gift on behalf of the city. By the way, the pictures are not frescoes.

A SERIES of lectures on Arts connected with Building is to be given once again at the instance of the Worshipful Company of Carpenters, on Wednesday evenings, commencing on January 12 of next year. The subjects announced are, "What is Artistic Craftsmanship?" by Professor BERESFORD PITE, F.R.I.B.A.; "The Art of Building, with special reference to the use and abuse of materials," by Mr. H. BAILLIE SCOTT; "The Carpenter's Craft," by BANISTER F. FLETCHER, F.R.I.B.A.; "The Joiner's Craft," by Sir A. BRUMWELL THOMAS, F.R.I.B.A.; "Native Craftsmanship in Timber, Brick, and Stone before the Eighteenth Century," by ARTHUR STRATTON, A.R.I.B.A.; "The Art of the Lead Worker," by LAURENCE WEAVER, F.S.A.; "The Art of the Plasterer," by GEORGE P. BANKART; "Castles in the Air," by C. F. A. VOYSEY; "The Use of Coloured Materials in Building," by HALSEY RICARDO, F.R.I.B.A.; "Mural Painting," by Professor GERALD MOIRA; "Coloured Reliefs and Mosaic," by R. ANNING BELL, R.W.S.; "Sculpture as applied to Buildings," by F. W. POMEROY, A.R.A.; "The Craft of Repairing Buildings," by THACKERAY TURNER, F.S.A., F.R.I.B.A. We do not think we have ever seen a better programme announced by the Worshipful Company of Carpenters. Admission will be free by ticket to be obtained from J. H. FREEMAN, Esq., the Clerk to the Company.

THE Survey of the Memorials of London is a work that has been hitherto carried on by the Committee for the Survey of the Memorials of Greater London, and also by the London County Council, and there has been consequently some danger of overlapping and of distraction in the minds of the public. This is now by way of being obviated, and the General Purposes Committee of the Council report as to the future arrangements as follows:—

A large amount of material suitable for publication has been collected both by the Council and by the Survey Committee (now known as the Committee for the Survey of the Memorials of Greater London). We have for a long time held the opinion that, having regard to the rapidly changing character of London, the continuation of the work should be no longer delayed and that it should be proceeded with under the supervision of the Council. As the result of prolonged negotiations with the Survey Committee the proposals hereinafter set out have been provisionally agreed, which will prevent overlapping, and will provide for co-operation between the Council and the Survey Committee in carrying out the work of the survey of the memorials of London in future. It is proposed that the agreement shall remain in force for five years, at the end of which period the Council's position in the matter may be reviewed.

It is not anticipated that there will be any expenditure during the current financial year in respect of the work, but in future it is hoped to publish at least one volume each year. The cost of publication of each of the volumes, which so far as at present can be foreseen will number upwards of fifty in all, will necessarily vary, but the average cost will probably be about 140*l.* a volume, and in addition there will be the cost, estimated at 50*l.* a volume, of taking photographs and copying drawings. In view, however, of the amount of material in hand, it is not anticipated that for the first few years there will be any expense in respect of the taking of photographs and copying drawings. Provision will be made in the estimates for the financial year 1910-11 in respect of the printing of one volume.

The cost of the work will be reduced by the proceeds of sales which, under the proposed agreement, will come entirely to the Council. We are not in a position to make a trustworthy estimate of what the receipts will amount to in future. The total net proceeds derived from the sale of Volume I. amounted to 19*l.*, but the interest of that volume was not very special, and we are of opinion that the regular publication of successive volumes may reasonably be expected to lead to a larger sale for all the volumes. An inducement to purchasers, other than antiquaries, will be found in the fact that a feature of the volumes will consist in the illustrations of specimens of artistic craftsmanship found in houses included in the survey. These illustrations will be of great use in handicraft centres, &c. The Council will also become possessed of drawings and particulars of historical interest of a value probably far beyond the expenditure involved in producing the volumes, and the obtaining of records of the historical buildings in London, which are fast disappearing, is, in our opinion, well worth the expenditure.

We recommend that an agreement embodying the undermentioned proposals be entered into with the Committee for the Survey of the Memorials of Greater London for the co-operation of the Council and that committee in carrying out the work of the survey of the memorials of London:—

1. All original drawings, photographs, and registers already prepared by the Council and the Survey Committee, or which may hereafter be prepared by them, to be deposited with the Council for reference, except such drawings, &c., as have been lent by their owners for publication only, or on which Mr. C. R. Ashbee has a lien. In the event of the Council withdrawing from the agreement, drawings deposited by the Survey Committee to be returned to them.

Digitized by Google

2. Existing registers of parishes to be brought up to date with all additional information collected by the Council and the Survey Committee.

3. Both drawings and registers to be made available for inspection at all reasonable times, to be fixed by the Council, by the members of the Survey Committee.

4. Information supplied by either the Survey Committee or the general public to be suitably acknowledged in the publications.

5. The Survey Committee to prepare drawings and information as heretofore, and the Council to continue the survey work as at present.

6. Subsequent volumes of the "Survey of London" to follow the model of the "Survey of Bromley-by-Bow"; such volumes as are prepared in the main by the Survey Committee to be issued under the acknowledged editorship of their editor, Mr. Philip Norman, and an interchange of proofs to be effected between the Council and the Survey Committee before the publication of any volume.

7. Publications to be issued from time to time in the joint names of the Council and the Survey Committee, the Council to bear the cost of production and take the proceeds of sale; but, in return for the assistance rendered, the Council to supply the Survey Committee, free of charge, with such number of copies (not exceeding 250) as will enable each active member and each member of the Survey Committee subscribing not less than 1*l.* 1*s.* a year to the Survey Committee's funds to be furnished with a copy of the volume.

8. The Council to recognise the volume relating to the parish of Chelsea already issued by the Survey Committee as forming Volume II. of the series of volumes to be issued.

9. The Survey Committee to present the Council for its own use, and not for sale purposes, with fifty copies of part I. of the volume relating to the parish of Chelsea.

10. When the Council and the Survey Committee shall have agreed to publish a volume of the general survey, the question to stand referred to a publishing committee, the constitution of which committee is to be hereafter agreed, composed of members of the Council and members of the Survey Committee, to arrange details; but all questions relating to finance to be excluded from the reference to the publishing committee, and to be in the hands of the Council.

11. Any future monographs that the Survey Committee may prepare with reference to buildings in the County of London not to be published until after the issue of the volume of the "Survey of London" dealing with the parish in which the building is situated; this arrangement to be without prejudice to the publication of a monograph on Morden College.

12. The agreement between the Council and the Survey Committee to remain in force for five years; and that the clerk of the Council and the solicitor do complete the matter.

THE Committee also report with reference to the interesting church of All Hallows, Barking:—

There has been brought to our notice a proposal of the Metropolitan and District Railway Companies to rebuild Mark Lane station. The proposal includes a scheme to erect over what is now practically a ventilating opening, buildings to a height of from 26 to 34 feet. As buildings of this height would seriously interfere with the view, from the north side, of the church of All Hallows, Barking, which is an exceptionally fine specimen of fifteenth-century Gothic architecture, containing much fine wood carving and many ancient monumental brasses, and one of the few churches that escaped the Great Fire of London, endeavours have been made to secure a restriction in height of the proposed buildings. At the instance of the Council certain modifications have been made in the plans which will lessen to some extent the obstruction to the view of the church, and we have caused a letter to be addressed to the Corporation of the City of London expressing the hope that it will take any action it can to secure an unrestricted view of the church.

SHORT METHODS OF CALCULATION FOR CHECKING REINFORCED CONCRETE WORK.*

By E. FIANDER ETCHELLS, F.P.S., M.M.A., A.M.I.M.E.

THE main purpose of this paper is not so much to show how the formulæ in reinforced concrete work are derived, as to show how they are applied in checking an existing design.

It is presumed that a set of plans have been placed before the municipal engineer, and that he is required to express an opinion upon the strength of the construction from the point of view of public safety.

In this paper it is assumed that the calculations must comply with the requirements of the Royal Institute of British Architects' report, but the notation will be on the "initial letter" principle, as worked out in the standard notation recently put forward by the Concrete Institute.

It should be noted that there is no conflict of principle between these two reports, but the adoption of a systematic notation should make the formulæ of the R.I.B.A.'s report less irksome to all who have not a long memory for algebraical symbols.

Now there are so many points to be observed, both in the design and in the checking of the design of reinforced concrete work, that they could not possibly be dealt with in one short paper.

The utmost that can be attempted here is to give a few equations for testing the strength at salient or critical points.

If the design passes these tests satisfactorily, it can be more closely examined. If it does not pass such test it should be referred back for reconsideration or revision.

One of the earliest points to be observed is to ascertain what loads have been allowed for in the case of arches, pillars, beams, &c., and what angle of repose and what weight of material have been taken in the case of retaining walls, bins, silos, &c.

The relentless force of merciless competition and the blind worship of the lowest tender both help to reduce the standard of strength.

Unfortunately the competition is not always upon a just and fair basis.

If it is specified that the stresses shall be in accordance with the R.I.B.A.'s report, one designer may still undercut all the others by taking very light loads or very high angles of repose, or by taking low values for any of the factors not within the special province of the R.I.B.A.'s report.

This preliminary reduction of loads or pressures is a very common means of obtaining a low tender. In asking for tenders the loads and pressures to be carried should always be fully specified.

In checking designs the data as to loads and pressures should always be examined at the outset, and before touching a single equation.

The fact that the calculations finish up neatly by showing the stresses to be within the limits set by the R.I.B.A.'s report is no proof of sound construction, unless the "loading" data is right, and unless the assumptions made in the calculations conform with irrefutable fact.

The following equations (wherever they contain numerical coefficients) are for use with concrete having a crushing strength of at least 2,400 lb. per square inch twenty-eight days after moulding:—

Pillars with Longitudinal Rods, and without Spiral Hooping.

Notation.

A = total cross-sectional *area* of a *pillar* (including the reinforcement) (square inches).

A_L = total cross-sectional area of the longitudinal steel rods (in square inches).

P = the total *pressure* on the pillar (in thousands of pounds).

c = the *compressive* stress intensity on the concrete (in thousands of pounds per square inch—usually about 0.5 thousands—*i.e.* 500).

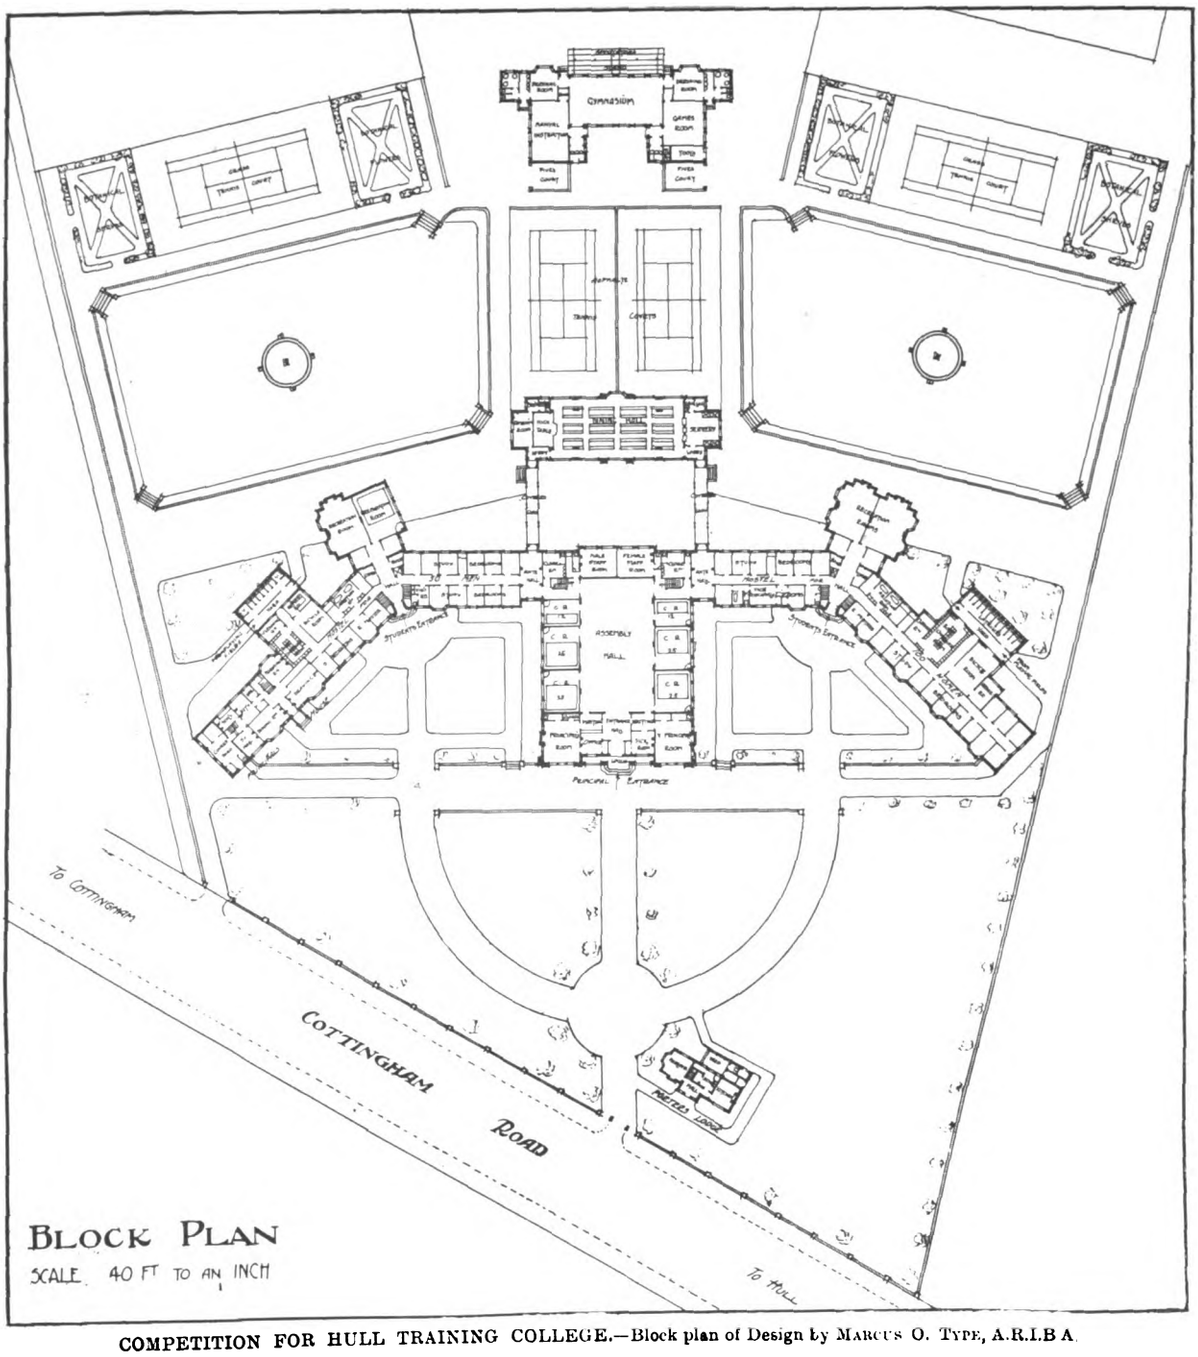
c_s = compressive stress intensity on steel.

For the purposes of calculation c_s is to be taken as being = 15c.

The value of c should not exceed 500 lb. per square inch for the concrete specified. It follows that c_s shall not exceed $15 \times 500 = 7{,}500$ lb. per square inch (say $3\frac{1}{3}$ tons).

Therefore all those designs which stress the steel in pillars to 7 or $7\frac{1}{2}$ tons per square inch, and assume that the concrete will take the rest, must be referred back for amendment if the R.I.B.A.'s report is to be complied with.

$$c = \frac{P}{A + 14 A_L} \qquad \text{(Equation I.)}$$



$$c_s = 15c = \frac{15 P}{A + 14 A_L} \qquad \text{(Equation II.)}$$

$$P = c(A + 14_L) \qquad \text{(Equation III.)}$$

By putting c at the maximum safe value of 500 lb. per square inch, P in Equation III. will give the total maximum safe pressure on the pillar in pounds.

* A paper prepared for the meeting of the Institution of Municipal Engineers on December 11.

COMPETITION FOR HULL TRAINING COLLEGE.—Block plan of Design by Marcus O. Type, A.R.I.B.A.

If we work in thousands of pounds, so as to reduce the amount of figuring, we get the following equation:—

The total safe pressure or load on a pillar in thousands of pounds = P where

$$P = \tfrac{1}{2}(A + 14\,A_L) \qquad \text{(Equation IV.)}$$

The $\frac{1}{2}$ in this equation is not merely a vulgar fraction; it represents half a thousand pounds per square inch.

In using any of the above equations the following conditions should be complied with:—

(1) The load should be static and axial (*i.e.* not eccentric).

(2) The length should not exceed eighteen times the least diameter.

(3) The horizontal bindings should not be further apart than one-third of the least diameter of the pillar.

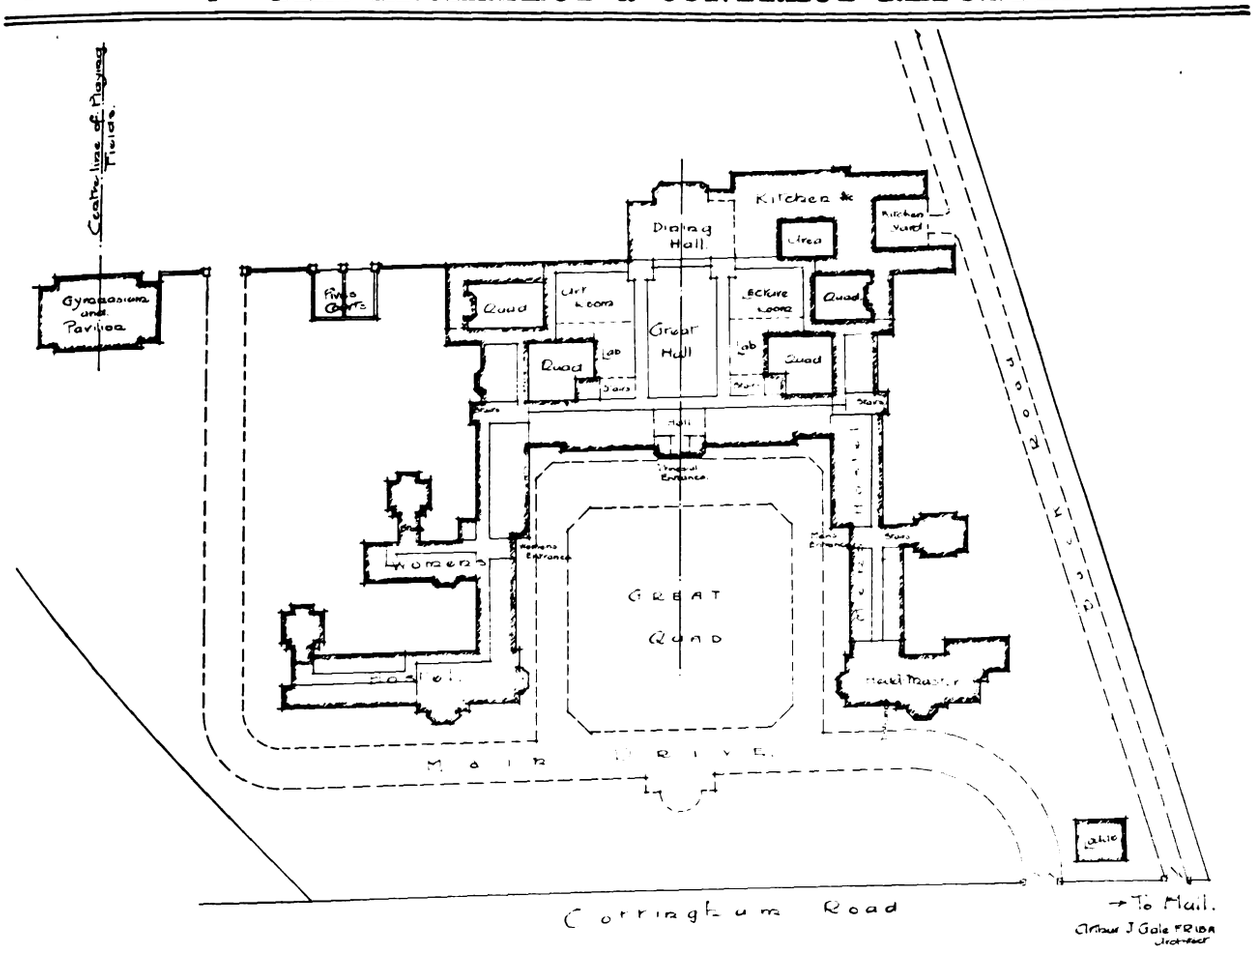
(4) The reinforcing rods should be near the outside of the pillar, but not nearer than their own diameter.

The R.I.B.A.'s report does not determine the minimum diameter of the bindings, but where round rods are used they are usually about $\frac{3}{16}$ inch to $\frac{5}{16}$ inch, according to the size of the pillar, and the load, and the spacing, and the quality of the concrete.

Rectangular Beams with Tensile Reinforcement.

In the case of plain concrete beams the neutral axis is assumed to lie at the centroid of the cross-section, but in reinforced beams such a beautifully simple assumption is untenable on account of the disturbing influence of many complex and indeterminate factors. The actual neutral axis is a shifting and fugitive line which even varies with the intensity of loading. The neutral axis referred to in ordinary practice is a hypothetical neutral axis, which is placed on "the safe side of uncertainty."

One of the basic assumptions which guide us in fixing the position of this nominal neutral axis is that "the tension in the concrete is negligible."



Let us examine this assumption for a moment, in order that we may be satisfied thereon.

With a concrete which crushes at 2,400 lb. per square inch the ultimate tensile resistance will be about one-tenth of that amount—say, 240 lb.

Now, on account of the difference in the elasticity of steel and concrete, equal deformations will not give equal stresses.

If the modular ratio (*i.e.* the ratio between the elastic moduli of steel and concrete) be taken at fifteen, then for low stresses the stress on the steel will be fifteen times the

Digitized by Google

COMPETITION FOR HULL TRAINING COLLEGE.—Block plan by A. J. GALE, F.R.I.B.A.

stress on the concrete at the same distance from the neutral axis.

Conversely the stress on the concrete will be one-fifteenth of the stress on the steel. When the tensile stress on the steel was 17,000 lb. per square inch, the tensile stress on the concrete would appear to be 17,000/15=1,134 lb. Now this 1,134 lb. is about 4.7 times (nearly five times) greater than the ultimate tensile strength of concrete, and yet to the casual observer no cracks are seen. What has happened? It was at one time thought that the tensile strength of concrete was raised by the steel helping the concrete across the weakest parts. Some such action may occur, but not to the extent which the credulous affirm.

The latest and most careful laboratory experiments reveal the presence of multitudinous microscopic cracks—smaller than hair cracks, and too small to be seen by the naked eye.

Of course, as the loading is proceeded with, and the yield point of the steel is approached, the cracks widen out prior to absolute failure of the beam.

We see, therefore, that at the ordinary working stress of the steel the tensile resistance of the concrete has been exceeded.

Therefore we are justified in neglecting it in our calculations for finding the position of the neutral axis.

Rather than here submitting a rigid mathematical proof of the exact position of an hypothetical neutral axis, it perhaps would be more helpful in the checking of designs to submit this large scale diagram which shows the position of the neutral axis for various ratios of steel and concrete.

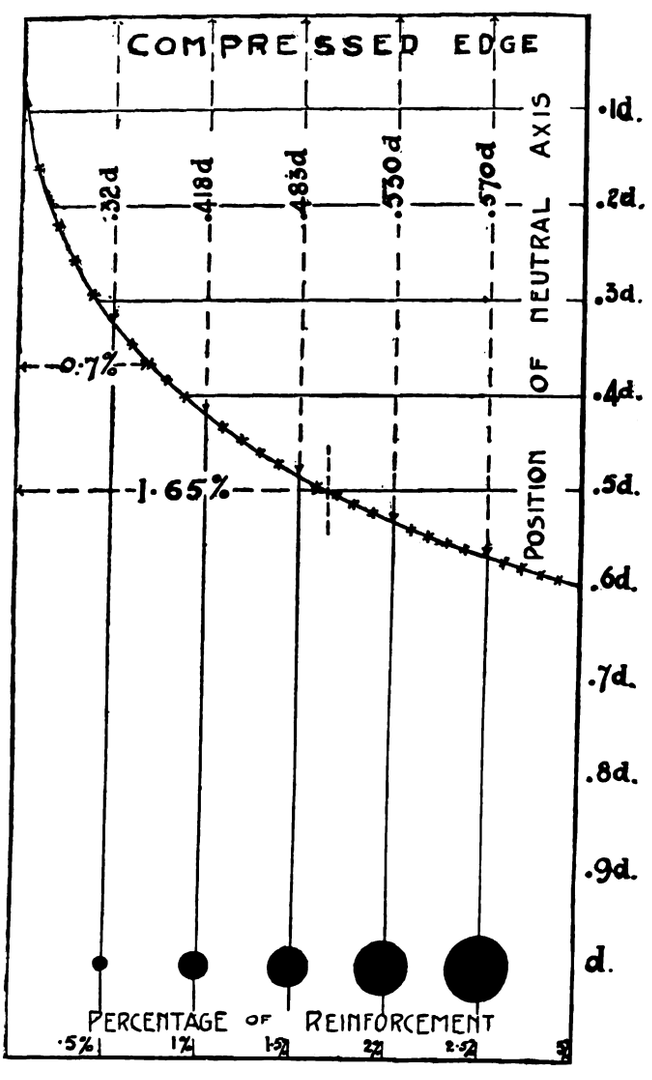
The points on the curve were found by the following equation:—

$$\frac{n}{d} = \sqrt{\left(r^2m^2 + 2rm\right)} - rm, \text{ where}$$

n = distance of the *neutral* axis below the compressed edge (inches).

d = effective *depth* of the beam, measured the compressed edge to the axis of the tensile reinforcement.

b = *breadth* of the beam.



A_t = *Area of tensile* reinforcement.

$r = A_t / bd$ = *ratio* of area of reinforcement to area of concrete.

m = modular ratio $= E_s / E_c = 15$.

The area of concrete in compression will be $b\,n$.

The compressive stress at the compressed edge will be $= c$.

Digitized by Google

The compressive stress at the neutral axis will be zero.
The mean compressive stress will be

$$\frac{c+o}{2} = \frac{c}{2}$$

The centre of the compressed *force* will be at a distance $= \frac{n}{3}$ from the compressed edge, or at a distance of $d - \frac{n}{3}$ from the axis of the tensile reinforcement.

The resistance moment of the concrete will be $= R_c$.

$$= \begin{pmatrix}\text{Mean}\\ \text{stress}\end{pmatrix}\begin{pmatrix}\text{Area}\\ \text{stressed}\end{pmatrix}\begin{pmatrix}\text{Lever}\\ \text{arm}\end{pmatrix} =$$

$$= \frac{c}{2} \cdot bn \cdot \left(d - \frac{n}{3}\right) =$$

$$= \frac{1}{2} cbn \left(d - \frac{n}{3}\right)$$

Let t = the tensile stress on the steel.
The resistance *moment* in terms of the tensile stress on the steel $= R_T$ where

$$R_T = t \cdot A_t \cdot \left(d - \frac{n}{3}\right)$$

As the beam may fail by excessive compressive stress on the concrete, or by excessive tensile stress on the steel, the lower of the two values R_c and R should be taken as the measure of the resistance moment.

It is hardly likely that the amount of steel in tension and the amount of concrete in compression can always be so evenly proportioned that neither would fail before the other.

The consequence is that, from the economic standpoint, there is usually an excess of steel or an excess of concrete.

In the case of rectangular beams with tensile reinforcement only, the critical or economical ratio is about $\frac{2}{3}$rds of 1 per cent.

For a lesser percentage of metal the beam will fail on the tension side, for a greater percentage of metal the concrete will give way first by crushing along the compressed edge.

[These remarks, of course, apply to beams which fail by bending; the question of failure through excessive sheer stress is not before us for the moment.]

When there is less than .67 per cent. of steel, the resistance moment may be taken as being approximately

$$\left(t \cdot A_t\right)\left(\frac{7}{8} d\right)$$

If the steel be stressed up to $7\frac{1}{2}$ tons per square inch, and if the percentage of steel does not exceed .67 per cent., then the following simple rule may be used:—

Let R_c = the resistance moment of the tensile reinforcement *in thousands of inch-pounds.*
A_t = area of tensile reinforcement in square inches.
d = effective depth in inches—*i.e.*, the distance from compressed edge to axis of tensile reinforcement.
Then $R_T = 14{\cdot}7\ A_t \cdot d$.

When there is more than 0.67 per cent. of reinforcement the *compressive* resistance will be the determining factor.

When there is more than .67 per cent., and not more than 2.5 per cent., the following approximate rule, devised by the author for his own use for rapid checking, may be employed. This rule does not necessitate any conscious use of the troublesome neutral axis:—

Let R_c = the *compressive resistance* moment in thousands of inch-pounds.

p = the *percentage* of reinforcement $= 100r$ since $r = \frac{p}{100}$

Then

$$R_c = \begin{pmatrix}90 + 20p\\ 1{,}000\end{pmatrix} bd^2$$

b and d being the breadth and depth respectively. (This rule is for concrete stressed up to 600 lb./ins.^{2} along the compressed edge.)

For example, take a beam with 2 per cent. reinforcement, the exact value of R_c would be

$$\frac{130{\cdot}8}{1{,}000} bd^2$$

while the approximate rule would give

$$R'_c = \frac{130}{1{,}000} bd^2$$

(To be concluded.)

ILLUSTRATIONS.

QUENBY HALL, LEICESTERSHIRE.

THE chimney stack on the east elevation and the corresponding one on the kitchen wing were built contemporaneously, and do not form features which existed originally on the façade. A window has been exposed through the recent alterations and casements inserted, and it was thought that a fireplace might have originally existed in the south wall, but such proved not to be the case, and a new flue had to be cut out.

Each room on the ground floor has a similar compartment beneath, and the whole of the floor is supported on brick vaulting.

The exterior of the building is of a very pleasant and bold character, the two side wings and central mass standing well out in perspective. The brickwork is formed with 2-inch bricks laid with the ample mortar joint of $\frac{3}{4}$ inch, and the surface treated with diagonal dark headers.

The whole structure is roofed with leadwork and a parapet wall carried all round. Oak is used throughout, and floors not laid with this material have 2-inch large Ketton slabs and black marble squares.

The entrance gates, which are at present in the Leicester Museum, are good examples of eighteenth-century wrought ironwork, and display similar detail to the smaller gate still extant in the courtyard of the hall.

We shall illustrate these gates next week.

COMPETITION DESIGN FOR TRAINING COLLEGE, HULL.

THESE two designs, by Mr. A. J. Gale and Mr. Marcus O. Type, were amongst the many good schemes that were submitted, and show how varied were the lines on which competitors worked.

INFANT SCHOOL, BRIDGEND.

MR. GRAHAM FAIRLEY'S design is sufficiently explained by the drawing as an example of an unpretentious country school.

SOUTH DOOR, PATRIXBOURNE CHURCH.

THE ancient parish church of Patrixbourne, near Canterbury, is a building in the Norman style. The interior of the nave has undergone a good deal of alteration, but the choir still retains most of its ancient features, including its fine arch and deeply-splayed round-headed windows and a beautiful "wheel" window in the east wall.

The church has a massive tower at the eastern end of the south nave aisle, which has been surmounted by a wooden steeple. On the south face of it there is a very fine round-headed doorway, the arch of which is most elaborately carved with scrolls, foliage, and animals, and is in an excellent state of preservation. The tympanum is filled in with carved work in two series; the upper, evidently representing the Saviour enthroned with the figure of an angel on either side, is much decayed, while the lower, representing some dragons or other grotesque animals, is in a better state of preservation. The caps also are carved with foliage and scroll work.

Above the doorway there is a very curious pediment containing a deeply-recessed niche, having a flat inner surface on which are the remains of a carving in low relief, but it is now very much decayed.

The door itself is modern, and the inner member of the jamb is of wood with markings on it to correspond with the joints of the surrounding stonework.

Unfortunately at some comparatively recent period the tower has evidently showed signs of sinking, and in order to preserve it a massive brick buttress has been built on either side of the doorway, partly obscuring the carved work.

The exterior of the church is almost entirely covered with ivy, which is so thick and tangled that scarcely any of the stonework is to be seen.

VARALLO, ORTA AND VARESE.*

(Concluded from last week.)

THE Sacro Monte of Varallo was, as I said, the first and for about 100 years the only thing of its kind. But in 1583 we have the first notice of a sanctuary being in contemplation at Orta. Here again the inspiration came from the Franciscan Order, and was probably suggested by a visit of S. Charles Borromeo to Orta on his return from Varallo. The single narrow street of which the little town of Orta consists runs along the shore of its lake, at the foot of a steep promontory which projects nearly halfway across the water. Its summit is occupied by the sanctuary. Here is a monastery and twenty chapels, standing in a sort of wood, intersected by grassy glades and commanding exquisite and everchanging views of lake and mountain. The entrance arch is approached by a cobbled path bordered by cropped limes. It is surmounted by a figure of St. Francis, in whose honour and to depict the scenes of whose life the chapels were erected. The materials employed here are the same as at Varallo, namely, granite and plaster, but with the addition of a dark serpentine marble, which takes the finest detail, and is used with excellent effect for the smaller moulded members, as caps, bases, and architraves. The lay-out differs from that of Varallo, inasmuch as the chapels have been placed so as to get the best effect from each separate building, rather than with an eye to picturesqueness of grouping.

All the best chapels were erected between the year 1591 and 1630. Dr. Goldhardt—to whose pamphlet I am much indebted—discusses the authorship of these works, and attributes them on evidence which seems fairly conclusive to a Franciscan, Padre Cleto, of Novara. He draws attention to the significant fact that the style is old-fashioned, in fact, about a century behind the times; and suggests the inference that the designer was an amateur of Classic architecture, uninfluenced in the seclusion of the cloister by current movements and fashions, and this by no means to the detriment of his art.

In contrast with the sculptures at Varallo, the figure groups here are of no account: "feeble silly cant," Butler calls them; nor is the arrangement of the darkish interiors so well adapted for their display. But all the more worthy of attention is the outside treatment. Delicacy, economy of means—in many cases the cornices and other members are reduced to their most rudimentary forms—elegance of proportion, these are perhaps the most outstanding notes.

We now come to two more important chapels. They are both simple oblongs surrounded by colonnaded loggias, and it is interesting to observe how from very similar plans two utterly different buildings grow. The first, known as the Madonna of the Angels, from the trumpeting angels on the roof, is the most ornate of all.

The fifteenth chapel, which has been so oddly connected with the name of Michelangelo, is one of those simple, inevitable, and masterly designs wherein consummate art lurks artfully concealed. The attribution of the authorship to the great Florentine master is, of course, worthless, except as evidence of traditional admiration. It is difficult to imagine anything more remote from the austere grandiosity of Michelangelo's manner than the Mozartian urbanity and grace of this little building. We are now on the highest point of the Sacro Monte, and are, therefore, prepared to find, as at Varallo, a circular chapel. The plan is of the utmost simplicity—a plain drum surrounded by a peristyle of twelve slender Doric columns bearing semicircular arches. The stylobate is broken at the cardinal points by flights of steps for access to the ambulatory which is roofed with a lean-to. The plan is the earliest example (1597) of a central block surrounded by a portico, and exercised considerable influence upon the later chapels both here and at Varese. Henceforth all the more important ones display this feature. The eighth chapel is obviously a variant upon the same theme, the octagon being taken as a basis instead of a circle. It is clear from the plan that the ambulatory involved the designer in sundry difficulties. The arches, if only eight in number, would become sprawling and ill-proportioned unless they could be carried to an extravagant height. The difficulty has been overcome by a similar device to that so often employed in the aisle of a Gothic apse, viz. by the division into alternate square and triangular spaces, producing thereby a sixteen-sided ambulatory. In a small late building like this, by no means one of the best of its kind, one is surprised at the feeling for effect, the unerring knowledge and command of every device whereby the desired effect is produced, the freedom in handling difficulties. The squares I spoke of just now in the plan of the ambulatory are not squares, the sides incline inwards towards one another, that was dictated by the proportions of the arches (and an Italian mason is not one to bungle over the irregular vault thereby produced); nor are the faces from which the cross arches spring parallel; that gets over another difficulty; true, it lands you in a winding arch, but as that is only in plastered rubble nobody's bones are broken.

I have dwelt thus at length on the plan of this chapel because, in spite of certain signs of debasement, it is a fair example of the skill with which these obscure masons handled their "Renaissance box of bricks." The next chapel is elliptical in plan—sure evidence of Baroque influence, and the porch seems stuck on. Inside there is a good iron screen. There must have been a school of excellent smiths in this district. Almost every house in the town has a good iron balcony, and the neighbouring villages and churches are rich in ironwork, as well as the Sacro Monte itself. Even when the design is a little riotous the workmanship is careful, and even precise. One of the most charming structures here is the little well-house. The pedestals and caps are pentagonal, which is, I suppose, the only way of getting comfortably round an octagon. The earliest of the chapels is the Capella Cannobbiana, so-called from Abbot Cannobbio, the originator of the whole scheme, and founder of this chapel, in which the canonisation of St. Francis is represented. The last is the Capella Non-finita, the unfinished chapel, which is really more of a belvedere than a chapel. It is a coarse but picturesque object.

The town of Varese is situated on the verge of the plain of Lombardy. About three miles to the north, in the direction of the mountains, and some 400 feet above the town, is the entrance of the Sacro Monte. The general scheme is quite different from what we have seen before; the chapels are not grouped in a confined space, but follow a broad paved road which ascends in zig-zags along a rising ridge. A chapel is placed at each turn of the road, and intermediately wherever a long straight run occurs. The road is perhaps 2½ miles long, and is the main approach to the ancient hill town of St. Maria del Monte, which occupies the summit. The construction of the road was contemporary with that of the chapels, and no little skill and feeling is shown in its disposition and planning. Not only had it to follow the line of least resistance, so far as climbing the hill is concerned; but it is so schemed that the chapels show to the best advantage from below, and also provide the best points of view for the enjoyment of the landscape. Again a Franciscan was the originator of the scheme, the execution of which was entrusted to the architect, Bernascone, of Varese. There are fifteen chapels, in illustration of the mysteries of the Rosary, each group of five being separated from the next by an arch and fountain. With the exception of five late and unimportant buildings all are Bernascone's work, and show him to have been a man of considerable imaginative and inventive power. Though begun only ten years later than Orta, it is quite 100 years later in manner. If the chapels there were the work of a refined and gifted amateur, here they suggest the professional man, quite up-to-date and to all the tricks of the trade. A marked difference is observable at once in the colour of the buildings; we have exchanged the stone roofs and whitwash of the mountain valleys for the tiles and yellowish stucco of the plains. Granite is more sparingly used, and the increased use of stucco instead of stone for ornamental features gives a sort of coarseness that smacks of a declining art.

The plan of the first chapel is similar to two of those at Orta, viz., a colonnaded portico round three sides of an oblong cell. But here the elevations suggest a Classic temple. We now find for the first time view openings in the sides of the building as well as in front. In this case they are rather prettily treated. The second chapel is insignificant, and at the first turn we come to No. III. Here importance is given to the side openings, which became regular transepts. Their treatment is, however, much more successful in the next chapel, which is designed like a domed church on the plan of a Greek cross, the transepts and aisles being as it were turned inside out. The external division of the copper-covered dome into eight unequal segments is noteworthy; the wide divisions corresponding to the transepts, and the narrow to the interspaces. The undue width of the broader divisions is cunningly counteracted by the keel-like form given to them.

Immediately opposite this last is the most important building of the series. It is also the most complicated both in plan and design, but is a fine, masculine piece of work, which, as I

* A paper read at the last meeting of the Architectural Association by Mr. F. C. Eden.

Digitized by Google

found on my second visit to Varese, improves greatly upon further acquaintance. The transeptal form of plan is again adopted, in this case grafted upon an octagon. The transepts instead of being connected by arcades, are joined merely by balustrades, which play a curiously important part in the elevation. At first sight it is impossible to believe that they are horizontal. Their raking lines seem to buttress the main portico with a studded effect of support, and cause the whole building to sit securely on the side of the slope. The illusion is increased by the want of parallelism between them and the main block, so that in perspective their lines vanish to different points. You will observe what excellent effect is obtained by tiling the cornices; how by this simple means a very strong line may be produced without unduly coarsening the mouldings.

At the next turn of the road the town on the mountain-top comes into view with something of a shock. The chapel of the Flagellation at this spot has certain good points; a life-size Pietà, most effectively placed over the portico, and some pretty plaster work in the vault. The road now ascends rapidly along the side of a deep valley to the Crucifixion chapel, with an interesting porch surmounted by a delicate pierced iron cross, designed to silhouette itself against the whiteness of the wall behind. The ironwork here is not quite up to the Orta level. It is often enriched with bronze ornaments which have acquired an exquisite patina.

The plan of the Ascension chapel is interesting; an elongated octagon within and an ellipse without, to which is attached a large portico, a sumptuous piece of Baroque design.

The last chapel of Bernascone's is very simply planned. "Ah, me! what perils do environ the man that meddles with" simplicity. It looks so inevitable, and is so full of pitfalls. The vaults of the ambulatory are barrels decreasing both in width and height inwards, sections of a cone, in fact; and the arches which separate them follow the lines of the pilasters from which they spring, so that an angle runs along the soffite, salient for half its circuit, and re-entering for the other half, and just disappearing at the apex.

But we are now at the end of our pilgrimage, which has been, I fear, a rather monotonous one. If what I have shown to-night should induce any of my hearers to visit these remarkable places, in autumn for choice, when the loveliness of the Italian hills is almost incredible, I am convinced that whatever his opinion of the merits of the architecture may be, his visit will not end in disappointment.

Mr. Theodore Fyffe, in proposing a vote of thanks to the lecturer for his paper, said Italy was an extraordinarily fascinating country in the north. The architecture was really distinctive and characteristic of the different localities, and there was a fine Early Renaissance feeling in most of it. Tradition called it generally Bramantesque influence, and the character seemed to be more applicable to Bramante than to Michelangelo. The figures which had been referred to should be looked upon as part of a stage representation, and in that light they became fine compositions.

Mr. Percy E. Newton seconded the vote of thanks, remarking that Varallo, Orta, and Varese were delightful places in which to spend a holiday. The colour in the towns was wonderful, and excursions to them could be made in comfort since the steamers there were not so thronged as at Como and Maggiore.

Mr. H. H. Statham said he was very much struck with the series of examples shown to them on the screen. Italy seemed a wonderfully endless place, for here they had a number of architectural erections which probably few of them knew anything about, and the fact proved that besides the well-known important monuments, the country in out-of-the-way places had objects of real interest. One point which struck him in regard to the various chapels, was the interesting variety of the planning, and in several cases they suggested the advisability when one was formulating a plan to consider how it was going to be treated in the superstructure.

Mr. Arthur Keen said the views exhibited wonderful detail, and although many of those present would feel that the architectural work shown in the buildings was of a rather amateurish and elementary kind yet the detail throughout was very good.

Mr. Gerald Horsley asked the lecturer if he knew whether Gaudenzio Ferrari designed any of the architecture of the buildings. They knew he was the sculptor of several of the groups in terra-cotta and that he probably painted in fresco many of the backgrounds on the walls of the chapels.

Mr. Eden, in his reply, said he had not been able to discover if Ferrari acted as architect for any of the chapels. He certainly was the sculptor of several figures in terra-cotta. The finest sculptor was generally supposed to be Tabacchetti, who overtaxed himself to madness, but he recovered after a few years and resumed work.

DROPMORE PARK AND STOKE POGES.*

Dropmore Park came into the possession of William Wyndham, afterwards Lord Grenville, at the end of the eighteenth century, and was then only a barren stretch of heathland. While still retaining the glory of the purple heather, its surface is now diversified with noble specimens of forest trees from all parts of the world. Wide spreading beeches and oaks mingle with graceful birches and stately cedars, while in that portion of the park known as the Pinetum there are specimens of rare deodaras, pines and araucarias, some of which are of great height. There is also a beautiful Italian garden, and the grounds are adorned with stately urns and busts of eminent men. The area of the grounds is as much as 600 acres. In front of Dropmore a hill was levelled so as to obtain a view of Windsor Castle. On the lawn stands a magnificent cedar of Lebanon, planted in 1794. In the spring and early summer the drives are gay with rhododendron and azalea blossoms. In the autumn the crimson leaves of the mountain ash add beautiful colour to the landscape. Among the curiosities of this place are an oak tree said to have been planted by Elizabeth and an arbour formed by one of the stone alcoves of old London Bridge. In the mansion is preserved a part of the elm tree under which the Treaty of 1681 between William Penn and the first inhabitants of America was signed in the neighbourhood of Philadelphia. The present owner is Mr. J. B. Fortescue, and the public are very greatly indebted to him, not only for his kindness in allowing the park and gardens to be seen, but also for the liberality with which he spends in order that they may continue to be unequalled throughout the length and breadth of Europe. Our fancy can picture Lord Grenville in his declining years spending his time in planting trees and planning landscapes with his thoughts running back to the times when at the age of twenty-three he became a Tory member of Parliament, at thirty Speaker of the House of Commons, then a peer and Leader of the House of Lords, afterwards becoming a Whig and Prime Minister of the Government of "All the Talents" which succeeded in passing the Bill for the Abolition of the Slave Trade. Lord Grenville died at Dropmore in 1834 at the age of seventy-five.

Burnham Beeches are the remains of an ancient forest, and now form a wild woodland tract of almost unique beauty. In 1883 about 380 acres were purchased for 6,000*l.* by the Corporation of the City of London and dedicated to the public for ever. The poet Gray describes it as "a little chaos of mountains and precipices." It is said that during the Civil war Cromwell's soldiers went to the forest and lopped the branches of the trees to provide stocks for their guns. It is probable, however, that the pollarding took place before their day. Finer single trees may be seen in many places, but nowhere so wildly picturesque an assemblage of ever varying giant trunks or such striking combinations of sylvan forms and colours and endless contrast of lights and shadows varied "by glens and valleys, interspersed with little rushy pools, the winter haunt of the snipe and woodcock, and overhung with the rich foliage of the holly, birch, juniper, and other trees, under whose shade the purple heaths flourish, and the fern and foxgloves add a charm and variety to the scene." Of its kind, little is wanting in this forest fragment, and winding forest roads penetrate in all directions, rendering every part accessible.

The history of Stoke Poges goes back to Anglo-Saxon times, when the manor was held by one "Siret, a man of Earl Harold." His lands were confiscated, and when the Domesday Book was compiled in 1086 A.D., the lands were held by William Fitz-Ansculf as "part of that extensive fief which lay in twelve counties and had Dudley Castle for its head." The manor came into the possession of the De Someries family at the end of the thirteenth century, and their tenant—Robert Poges—gave to the parish the name it has held ever since. About 1330 A.D. the manor passed into the possession of Sir John de Molyns and remained in that family for a century. The last heiress of this family married a Lord Hungerford, and later a Hungerford heiress married a Lord Hastings, their son becoming the first Earl of Huntingdon in 1529. The third earl mortgaged the manor and it then passed into other hands. It is supposed from the opening lines of Gray's poem, "Long Story," that Sir Christopher Hatton, Queen Elizabeth's Lord Chancellor, was the purchaser. It is, however, certain that the great lawyer and Lord Chief Justice, Sir Edward Coke, owned the manor from 1591 to 1634. He entertained Queen Elizabeth here in 1601 and presented her with jewels to the value of 1,000*l.*

Succeeding lords of the manor were Sir John Villiers, Viscount Purbeck, Lady Cobham (the poet Gray's friend), and from 1760 to 1840 the Penn family. The church of Stoke Poges, dedicated to St. Giles, is at a distance of one and a half miles from the village, having been built nearer the "great house" of the parish than to the houses of the retainers and others. As we leave the roadway we approach the church through the lych gate, erected in 1887, the graceful spire of the church rising beyond. The churchyard itself possesses many features of interest, and is so well kept as to render this fact worthy of remark. The plain, not to say ugly, tomb of the poet Gray lies just outside the east window of the Hastings chapel, below which is a tablet re-

DROPMORE HOUSE

cording his burial. He was buried by the side of his mother, whose death caused him so much grief. Opposite the south door is the yew tree known as Gray's yew because he was wont to sit under it and do so much of his writing there. Both church and churchyard have, however, been altered so much since Gray's time that a great deal of the rural simplicity which Gray's Elegy would cause one to picture has been lost. The painted wooden spire was erected in 1831 and the tiled roof covers both nave and aisle in one unbroken sweep. The oldest existing portion of the church is the north wall of the chancel, which has probably been standing since 1107 A.D. It contains a small Norman window as well as two Early English lancet windows, now blocked up. The fifteenth century doorway in this wall probably gave access at one time from the church to a sacristy, which will account for the piscina now low down on the outer wall close to its eastern end. The material of the walls is chalk and flint occasionally arranged in chequer pattern, but for the most part roughly intermixed. On the south-east of the chancel is the Hastings chapel, the Hastings arms being still extant over the door giving entrance to the chapel. It is of red brick, mostly covered with old stucco and with stone-mullioned windows of a plain Tudor type. There was an ancient western doorway, but this has been very injudiciously restored, the lower part being bricked up and the upper portion being turned into a poor window.

Entering by the porch, one cannot fail to notice its front constructed out of two great oak timbers which have stood the strain and stress of all weathers for between 500 and 600 years. Inside we note the massive columns supporting the arches. In 1897 the plaster was stripped from the walls and a flat ceiling removed, opening out a roof whose heavy beams and timbers can now be seen. On the right as we enter is the chantry founded in 1338 A.D. by Sir John de Molyns, containing an aumbry and a double piscina and a modern window of Munich glass. The aumbry and piscina were discovered in 1897 when the walls of the nave were stripped of the plaster. On the left in the south-west corner is a tablet on which are inscribed the names of many of the Penn family. The entrance to the Penn vault is close to the font. The floor of the tower, which is on the left hand as one enters the chancel from the nave, is a faculty pew belonging to the owner of Stoke Park. Immediately over it is the ringing chamber and a gallery for the ringers. This pew and gallery date from 1800 A.D., when the Hastings chapel was turned into a vestry.

The pointed chancel arch is built only of brick and cement. It is supposed that the original arch was a round Norman one of stone, but no traces of it remain. When this act of vandalism was committed there is nothing to show, but in specifications of works done in 1844 we read the following item:—"To clear away the brickwork and enlarge the openings of entrance to chancel, and form an arch agreeably with drawings to be supplied." This was at the time when some of the galleries were erected in the Hastings chapel.

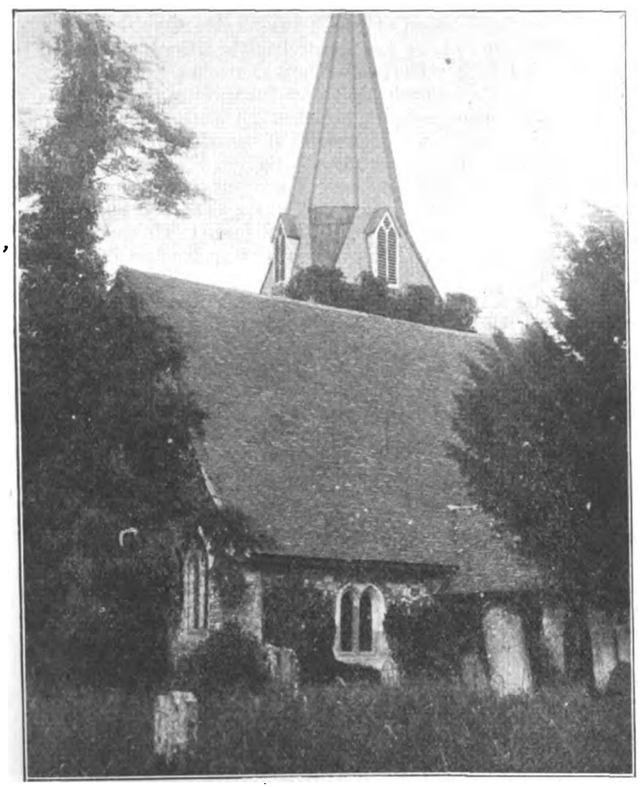
The west window is modern and a good example of Kemp's work. In the north-west corner is a tablet with a beautiful little marble figure by Flaxman and two windows of modern glass.

From the north side of the nave a passage or so-called cloister panelled with oak and containing four indifferent painted windows leads into a low hall or vestibule in which there is some old glass of considerable interest. This is the private entrance from Stoke Park. Four of the windows are filled with Flemish glass probably intended originally for windows of much larger size. The other windows are filled with glass brought from the old manor-house on its demolition in 1790. It displays the arms of Roger Manners, son of Dorothy Vernon, of Haddon Hall; of John Fortescue, a descendant of Dorothy Vernon; of Sir Walter Mildmay, the founder of Emmanuel College, Cambridge; and of the families of Ducie and Pipe, Ducie and Pyott, and Ducie and Sheffield quartered together. Here also is seen what is usually described as the "bicycle" window. As the window is made up of fragments of glass it is impossible to see what was the complete design of which the bicycle is part.

On the south side of the chancel is the Hastings chapel, which has altogether lost its ancient character. In order to include it in the church the south chancel wall has been removed, the opening being finished off with a flat beam. The east end has been screened off to provide a vestry, the organ obscuring the east window. Galleries, fireplaces and a brick flue and chimney have been put in without any regard to the original design and purpose of the building. The numerous hatchments of the Penn family, Howard-Vyse family and others, form, however, a distinctive and interesting feature.

The chancel contains some features of interest. On the north side within the altar rails is a recess—probably an aumbry—the niche or cupboard in which the sacred vessels were kept for convenience. The fifteenth-century doorway, bricked up for many years, has been recently opened and leads through a passage to a new vestry. On the south side of the chancel is a very beautiful Early English piscina.

DROPMORE HOUSE



The church contains some memorials which should receive notice. On the north side of the chancel is a tomb supposed to be that of Sir John de Molyns, but the effigy which probably reposed there has vanished. On the wall above is a curious mural monument with cherubs' heads above and skulls below, but with no inscription to tell us whom it was intended to commemorate. But the most ancient monument is the flat tombstone dug up in the churchyard and now lying in front of the De Molyns tomb. A floriated cross is sculptured on it in low relief, and round the edge

Digitized by Google

runs an inscription in Norman-French of the twelfth or thirteenth century.

There are three brasses within the altar rails. The oldest on the north side is to Sir Wm. de Molyns and Dame Margaret his wife. Sir William fell in 1425 at the siege of Orleans. On the opposite or south side is the slab where used to be the effigy of their daughter, of which only the inscription remains. In front of the altar is a brass to Edmund Hampdyn and family, relatives of the celebrated John Hampden.

The poet Thomas Gray, who is associated with our visit to-day, was born in London on December 26, 1716. His father was on the Stock Exchange, but he was unsuccessful and indolent, and the welfare of the family depended on his mother, who was a milliner in partnership with her sister Mary in Cornhill. He was one of twelve children, but all the others died in their infancy or childhood. Gray was educated at Eton and at Peterhouse, Cambridge, where he occupied himself with classical literature, history, and modern languages. After leaving Cambridge, he, in company with Horace Walpole, visited Paris, Florence, Rome and other important centres of learning, remaining abroad more than two years. Soon after his return his father died and his mother settled down at Stoke, while Gray gave up his idea of studying for the law and went into residence at Cambridge. The first of his poems appeared in print in 1747, some time after it was written. The post of Poet Laureate was offered to him in 1757, but declined. In 1768 the professorship of modern history—a post for which he had a great

STOKE POGES CHURCH.

desire—was offered to him by the Duke of Grafton. But he did little work, for his health was bad. On July 24, 1771, he was seized with illness while at dinner in the College Hall, and on July 30, 1771, at the age of thirty-four, he died. A few pages hold all his poetry. Still, the reputation which he has achieved by his few pages is extremely high. For while Johnson speaks of Gray with coldness and disparagement others, such as the poet Mason, Mitford, Beattie Cowper and Sir James Mackintosh united in summing up his work as having attained the highest degree of splendour of which poetical style seemed to be capable. Gray himself maintained that the Elegy was not his best work in poetry, and it undoubtedly owes much of its success to the subject, while other productions of Gray exhibit higher poetical qualities. The style he aimed at was, to use his own words, "extreme conciseness of expression, yet pure, perspicuous and musical." "An Elegy wrote in a Country Churchyard," to give the poem the title under which it first appeared in print, possesses all these qualities and became popular at once. It is related that on the night of September 13, 1759, the night before the battle on the Plains of Abraham, General Wolfe was descending the St. Lawrence with a part of his troops. "Swiftly and silently," writes Lord Mahon, "did the boats fall down with the tide, unobserved by the enemy's sentinels at their posts along the shore. Of the soldiers on board, how eagerly must every heart have throbbed at the coming conflict; how intently must every eye have contemplated the dark outline as it lay pencilled upon the midnight sky, and as every moment it grew closer and clearer, of the hostile heights. Not a word was spoken—not a sound heard beyond the rippling of the stream. Wolfe alone—thus tradition has told us—repeated in a low tone to the other officers in his boat those beautiful stanzas with which a country churchyard inspired the muse of Gray. One noble line, 'The paths of glory lead but to the grave,' must have seemed at such a moment fraught with mournful meaning. At the close of the recitation, Wolfe added, 'Now gentlemen, I would rather be the author of that poem than take Quebec.'"

In 1799 Mr. John Penn caused a large monumental cenotaph to be erected in the field adjoining the churchyard at Stoke. The imposing monument, designed by the architect Wyatt, consists of a stone sarcophagus raised upon a massive square pedestal, on three of whose sides are inscribed some stanzas from Gray's poems, while on the fourth side is a suitable inscription.

THE PRACTICAL ADMINISTRATION OF TOWN PLANNING POWERS.*

THE Association under whose auspices we meet to-day was formed ten years ago, and at that time most people looked on Garden Cities and Town Planning with the utmost scepticism.

The original objects of the Association were in part the objects of the new Town Planning Act. To secure the better control and supervision of the growth of new towns and the expansion of old towns, to prevent the haphazard development of vacant urban and suburban land, the consequent development of slums, and the costly process of reconstruction in connection with street improvements; and to encourage the provision of open spaces and the limitation of the number of houses per acre—these were the objects of this Association, and they are now the recognised objects in the law of the country, thanks to the statesmanship of the President of the Local Government Board.

It is notable that the public support secured to the Association in these early days was due in a greater degree to the objections to overcrowded and insanitary housing conditions, than to any belief in a constructive policy in regard to the planning of our towns and cities. In that ten years the education of the public has been remarkable, town planning has become an essential part of the movement for housing reform, its principles have been recognised in many schemes of suburban extension and the establishment of a new town at Letchworth. It has seized hold of the imagination and attracted the practical genius of civic rulers and borough surveyors, it has begun to take its place in universities and colleges of art, the great architectural profession has recognised to a greater extent than formerly the true place of civic design as a branch of study, and the first Town Planning Act has been placed on the Statute Book. It has been a great leap forward, and it is richer in promise than it is in achievement.

In that work of education this Association has taken the most prominent part, assisted by the ideas of Mr. Ebenezer Howard, its founder, the practical experiments of George Cadbury, W. H. Lever, the first Garden City Company, Hampstead Garden Suburb Trust, and others, and the investigations of T. C. Horsfall and John S. Nettlefold.

Of course, I speak of town planning in the sense in which it concerns not only the architect, but also the surveyor, the engineer, the civic ruler, the physician, and the economist.

Civic design has always been a subject of study and interesting speculation among architects, but the limited opportunities of practical work have neither stimulated thought nor encouraged genius in developing the art. Opportunities have come to a few such as Sir Aston Webb and Mr. Unwin, in our own day, but the field is so extensive and the need so great that the workers should be legion. Even under the new Act the scope for the architect is limited and the time is hardly yet when we can bring proper architectural control to bear upon development in our towns. In so far as the new Act will result in the establishment of a stronger architectural

* A paper read at the Guildhall, London, by Mr. Thomas Adams, on December 10.

Digitized by Google

department at the Local Government Board, and the appointment of local architects to act in co-operation with borough engineers and surveyors, or in the increased architectural knowledge on the part of surveyors themselves, it will help in developing an improved taste in building design, and a proper sense of proportion and harmony in the development of building areas. But the work to be performed will fall for the most part into the hands of local engineers or surveyors, except in the large cities, where permanent architects are employed. At the same time town planning schemes will only be truly successful if the architect is allowed to take his proper place in their preparation.

The Parts of the Act.

The four parts of the Housing and Town Planning Act deal with:—1. Housing of the Working Classes; 2. Town Planning; 3. County Medical Officers, County Public Health, and Housing Committees, &c.; 4. Supplemental, Provisions as to Commons, Open Spaces, and Land in the neighbourhood of Royal Palaces or Parks.

The first and third parts deal with questions of housing that have from time to time been the subject of previous Acts of Parliament, and contain important amplifications of existing enactments dealing with public health and housing. The provisions of the Act in these respects are important and give a reality to much of previous housing legislation in respects in which it was either unworkable or lacking the driving force of central control over local administration.

Town Planning.

Our object is to consider the administration of the town planning powers created in Part II.

Much of the credit that can be given to Mr. John Burns in connection with this measure is the fact that he has introduced town planning as an essential and integral part of housing legislation. It is notable that although the town planning part of this Act contains the most novel and in some respects the most far reaching of its provisions, it was received by members of all parties with greater favour and less controversy than any other part of the proposals put forward in the Bill which is now an Act. This is due to two or three very evident reasons. Whatever difference of opinion there may be as to the methods of housing reform that have for their object the alteration of existing bad housing conditions, there is no doubt that town planning is a necessary part of any reform which aims at preventing a repetition of these conditions in the future. It is looked upon with more favour as one of the solutions of the problem, because it deals with it at the point of least resistance and its methods involve least hardship to individual interests.

A good deal has been written about town planning during the past two years. We have had the important investigations which Mr. T. C. Horsfall and others have made into Continental town planning, particularly in Germany. Germany has preceded us in this movement by nearly a generation, for reasons well understood by those who have studied German municipal history and institutions. Town planning, involving as it does a certain amount of central control, can be adapted more easily to German than to English conditions. Germany was also later than England in enjoying the commercial advantages of the industrial awakening of last century, and by the time her towns had begun to grow rapidly, as a result of that awakening, modern ideas with regard to sanitation, public health, and town development had taken a firm hold all over Europe. Not an unimportant factor in Germany's advanced thought and activity in this direction is that her towns are managed by permanent mayors and more or less permanent councils, which, by having the benefit of continuous experience and expert knowledge of the causes and effects of town growth, have applied that experience and knowledge in the directions in which the most permanent effects can be obtained.

There is one direction in which England has nothing to learn from Germany. Whereas in Germany town planning leads to centralisation of industries and population, efforts at town planning which have so far been made in this country have either been the result of, or have been concurrent with, movements for decentralisation. Town planning in Germany encourages the creation of wide thoroughfares, high tenement dwellings, small and highly-rated houses closely crowded together, and dear land. In England decentralisation has so far been one of the bedrock principles of what is known as a Garden City movement. We can learn from Germany the commercial value of having wide streets where they are wanted for traffic—planted with trees and laid out with gardens—the desirability of having the main public buildings arranged on sites where they can be seen and enjoyed to the best advantage, and the importance of having the stations, main approaches and main radiating thoroughfares laid out so as to give dignity and strength to our towns; but we have nothing to learn in regard to provision for the happy detached home-life of the people.

Mr. Burns's Act is framed with a knowledge of the conditions which prevail under English local government, and recognises that town planning at least for a time will concern itself chiefly with the proper control of the suburbs and outlying districts surrounding our towns.

The provisions of the Act are shown to be framed to secure this end.

Objects of Town Planning.

The first section of Part II. of the Act (section 54) provides for town planning schemes with regard to any land which appears likely to be used for building purposes with the general object of:—

1. Securing proper sanitary conditions.
2. Securing amenity and convenience in connection with the laying out and use of the land and of any neighbouring lands.

1. *Proper Sanitary Conditions.*—These may be understood to be the conditions usually required to be carried out under the Public Health and Housing Acts and under the by-laws in force in the various districts concerned. So far, those by-laws have been principally applicable to the width and formation of roads, questions of drainage, water supply, &c., but it has not been possible for local authorities to insist upon any conditions which have in view the future development of the land or the development of any neighbouring lands. No doubt by-laws will be altered and strengthened to make it possible for local authorities to be provided with the larger powers contained in this Act, and provision is made for this purpose.

The factors that secure proper sanitary conditions have also some relation to the "amenity and convenience in connection with the laying out and the use of the land." Few authorities, however, would interpret "sanitary conditions" as involving such things as the limitation of the number of houses to each acre, preservation of natural features or other amenities, or the exercise of foresight in regard to traffic conveniences of the future. It is well, therefore, that one of the objects of the Act is to do more than merely to secure what may be technically called "proper sanitary conditions."

2. *Securing amenity and convenience in connection with the laying out or use of the land or any neighbouring lands* is an object which if properly interpreted will lead to much useful work. Considering the extent to which this general object of the Act rests at the basis of town planning schemes to be prepared under this part of the Act, one is led to hope that local authorities and the Local Government Board will interpret it in a generous way. Provision is made in the Act for authorities to receive one half of any increased value which a scheme may be estimated to give to the land included, and if proper consideration is given to the preparation of town planning schemes, they would in nearly all cases appreciate and not depreciate the value of property affected by them. It is generally agreed that the old method of crowding houses on each acre of land without any consideration for the health of the community has been discredited from a business point of view. Investments in such property have seriously depreciated in recent years. Destruction of natural features such as trees, which might with no extra expense be preserved in roads and gardens, may enable land developers to pocket larger ground rents or to receive higher prices for their land at the time of development, but building estates on which such vandalism takes place depreciate much more rapidly than those in which some attempt is made to give good gardens and to preserve the trees. This being so it should not only be to the general public advantage to preserve the amenities of building areas, but it should also be advantageous to those who own the land and the local authority to enjoy an income from the local rates. The question of what is "convenient" in connection with the laying out of land is capable of broad or narrow interpretation, but as it is a matter which has yet to be defined and regulated under the control of a central body of experts, no doubt the broadest construction will be placed upon it, subject to considerations of economy.

TOWN PLANNING SCHEMES.

Having analysed the objects of what is described in the Act as a town planning scheme it might be as well to inquire whether anything in the Act makes it more clear what such a scheme is. We see that the intention is that the schemes should apply to land which is either in the course of development or appears likely to be used for building purposes. It may be prepared by a local authority with reference to any

OFFICES OF THE PRAGUE IRONWORKING COMPANY AT PRAGUE.—Baurat J. Zasche, Architect.

land within or in the neighbourhood of their area. Land already built upon may be brought into the scheme if it is thought desirable, and buildings thereon may be demolished or altered.

A scheme may also include (see section 54, sub-sec. 7) land likely to be used as, or for the purpose of providing open spaces, roads, streets, parks, pleasure or recreation grounds.

If we consider the land to which the scheme has to be applied and the objects I have described, we have a fairly clear interpretation of what a town planning scheme is. It will involve the consideration of roads and streets not only from the point of view of the sites immediately served by them, but also from the point of view of their ultimate destination, the future needs of traffic, and the general public convenience.

Questions of drainage and water supply will follow that of road making as a natural course. At present, land is laid out on the principle that everybody's business is nobody's business, and even the owners of large estates are driven by considerations of immediate economy, and the want of co-operative action with other owners, to develop their properties without proper consideration for the future.

Preparation and Approval of Schemes.

Under section 54, sub-sec. 2, the initiative for preparing a scheme rests either with the local authority or the owners of land acting in co-operation with the local authority. Before preparing a scheme of its own or adopting a scheme proposed by owners of land, the consent of the Local Government Board must be obtained and they must be satisfied that there is a *prima facie* case for making the scheme. This scheme may include land already built upon, or land "not likely to be used for building purposes." Such land may be included with the authority of the Board and buildings may be demolished or altered for the purpose. The Board's sanction is necessary before the scheme can have effect given to it, and it may insist on any modifications or conditions.

This is necessary both from the point of view of making purely local schemes to conform to what may be described as county or national requirements, and in order to obtain that central architectural and expert supervision which the smaller authorities will be unable to employ but which the Local Government Board will no doubt have at its command.

No provisional order or private Act of Parliament is necessary and the whole procedure is fairly simple. If, however, any interested person or authority raises a formal objection to any scheme the draft of the Local Government Board order shall be laid before each House of Parliament for thirty days, and if either of the houses object no further proceedings can be taken. If no objection is raised the issue of the order giving the approval of the Board will give effect to the scheme as if it were enacted in the Act, but it may be afterwards varied or revoked in favour of a subsequent scheme, or if satisfactory reasons are given, it may be revoked altogether.

General Provisions.

In view of the responsible position occupied by the Local Government Board it is very desirable that the fullest possible instructions and information should be supplied to the local authorities. The Board is therefore empowered (sec. 55) to prescribe a set of general provisions for "carrying out the general objects of town planning schemes." These provisions will be probably in the form of an amplification of the by-laws. They will not refer to procedure. The procedure regulations are dealt with in sec. 56, with which section I shall deal in due course. The Act very properly provides for having separate sets of these general provisions adapted for areas of different character. Those who have experienced the unsatisfactory results of having a rigid set of by-laws applicable to districts of very varied character will appreciate the desirability of this provision. The special matters to be dealt with in these provisions are summarised in the fourth schedule of the Act. The matters to be dealt with include streets, roads, &c.; stopping up and diversion of existing highways; buildings, public and private open spaces, preservation of objects of interest, sewerage, lighting, water supply, extinction or variation of rights of way, &c., dealing with land, power of entry and inspection, power to alter or remove destructive work, power of authority to make agreements and co-operate with owners, and owners with one another, &c., &c.

Under section 64 these general provisions must be laid before Parliament and they shall become statutory rules under the Act.

Digitized by Google

Special Provisions.

Special provisions shall be inserted in each scheme to provide for definition of area, authority, supplementing, excluding or varying general provisions, or dealing with special contingencies or circumstances not provided for; suspending any statutory enactments, by-laws, or regulations, &c.

(To be concluded.)

OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* contains a fourth paper in the series on the Architectural Exhibition at the Brooklyn Museum, by Mr. Wm. H. Goodyear, M.A., in which he concludes his arguments on the asymmetries of Pisa Cathedral. We are given in this issue a number of photographic views of the architecture of old Mexico, of what is usually known in the States as the "mission period," that is, the sixteenth and early seventeenth century.

La Construction Moderne illustrates the grand stands of the race-course at Buenos Aires, of which M. Faure-Dujarric is the architect, and the central fire brigade station and municipal gymnasium at Saint-Owen, designed by M. Mancel.

Deutsche Bauzeitung gives a description and illustrations of the new government buildings in Karlsruhe, containing the offices of the Baden Grand-ducal archives, finance department and legal administration, of which the architects are Oberbaurat Adolf Hauser and Professor Friedrich Ratzel. We are also treated to some further illustrations and description of the details of the new Rathhaus at Rixdorf.

Moderne Bauformen devotes itself chiefly this month to the work of members of the Kiel branch of the Bund Deutscher Architekten, which has a distinctive character of its own in its version of the sober development of "new art" that is now, one might almost say, the national style of Germany in architecture. The work of the Kiel architects is supplemented by examples of that of Professor Alfred Grenander, of Berlin, and a few unconnected artists, amongst which is a coloured drawing of an interior by Mr. Edgar Wood, A.R.I.B.A.

Architekten und Baumeister Zeitung has another block of flats by Rudolf Erdos in the Neulinggasse, Vienna, illustrated by plans and elevation.

The *Architectural Record* has a good illustrated account of Buda-Pest, the most wonderful modern city of Europe, deliberately intended to surpass Paris and Vienna by her citizens and artists. In the series of articles on American colleges, Yale is dealt with this month.

The *Engineering Record* has an illustrated description of an example of a class of building that will probably be more frequent in the future than it is at present, a balloon house for the Signal Corps of the United States Army at Fort Omaha, Nebraska, a steel building, 84 feet by 200 feet and 81 feet high over all, intended to shelter a full-sized dirigible balloon. Two articles deal with attempts to reduce the cost of reinforced concrete building, the one by building the external walls of brick, the other by building with separately cast members instead of concrete moulded in situ.

COMPETITIONS.

Karachi.

THE competition for new municipal office at Karachi is one that ought to be left severely alone, even by the tyro who has just finished his articles. The cost of the building is to be 33,333*l.* 6*s.* 8*d.*, and what competitors are to fight for is the opportunity of making all the drawings for elevations and detailed plans, including "further details specified in the instructions to architects," for a premium of 500*l.* The Municipality are to "have all rights in the design, with power to erect the building under its own agency, either according to the design selected, or with such additions or alterations as it may deem necessary." That is, the author's design may be mutilated to any extent at the caprice of the Municipality.

Cwmgorse.

Another competition that should be ignored by every right-minded architect is the invitation to "tender" for plans, specification and quantities, for a chapel at Cwmgorse. This is nothing less than an insult to architects and architecture, which is thus placed on a level with the supply of coals, cheese and other everyday objects of commerce.

Doncaster.

A limited competition was recently held for a technical school to be erected on the site of the old Vicarage, Doncaster, at an estimated cost of 13,000*l.* The assessors appointed by the higher education committee were Messrs. Briggs & Wolstenholme, architects, Blackburn, and their report has now been adopted. Their award was as follows:—1, W. P. Schofield, Albion Street, Leeds; 2, Messrs. Russell & Cooper, Gray's Inn Square, London; 3, Mr. Morris Thompson, of Lytham.

Oswestry.

The designs of Messrs. Appleyard & Quiggin, architects, of Lord Street, Liverpool, have been accepted by the Salop higher education committee for a girls' secondary school at Oswestry. (Limited competition.)

London.

Mr. Alfred E. Wheeler has been awarded the "Saxon Snell" prize of 50*l.*, and the Royal Sanitary Institute bronze medal for his essay on the "Heating and Ventilation of Public Buildings," which was submitted in open competition under the terms of the "Saxon Snell" prize.

Workington.

The open competition for designs for the proposed new technical and secondary school which is about to be erected at Workington by the Cumberland County Education Committee closed on November 30, when forty-two sets of plans had been received from architects. The school is to accommodate about 300 pupils of both sexes. The assessor appointed to assist the sub-committee was Mr. Wood, of Messrs. Oliver Leeson & Wood, Newcastle. The award was as follows:—(1) Messrs. Clark & Moscrop, Darlington; (2) Messrs. Cheers & Smith, Blackburn; (3) Mr. D. A. Beveridge, Liverpool; (4) (bracketed) Mr. Henry Higginson, Carlisle, and Messrs. Kelvey & Pennington, St. Annes-on-Sea.

GENERAL.

Founders' Company.—This City Guild which existed as a Mistery prior to 1365, and has received three charters, the first of which was granted in 1614, announces an exhibition of foundry work in aluminium, bronze, gold, iron and silver, when British subjects residing in England engaged in foundry business or allied trades can compete. The competitions are for castings and models, as well as of designs, and it is open to founders, designers, craftsmen, apprentices and improvers. The prizes vary in value from 20*l.* to 2*l.* 10*s.*, together with the Company's certificate and silver and bronze medals. The freedom of the Company may be conferred in cases of special merit.

The South Wales Branch of the Guild of Architects' Assistants held the first of a series of meetings in Cardiff on December 17. The Cardiff, South Wales and Monmouthshire Society of Architects kindly lent their room for the purpose. A paper was read by Mr. S. Bowen Williams on "Llandaff Cathedral," and was followed by a very interesting discussion.

The Trustees of the Chapel of the Knights of the Thistle, Edinburgh, appointed by the King, held a meeting last week in Edinburgh. Various matters connected with the building and the internal arrangements and decoration were considered and disposed of. The trustees inspected designs prepared by Mr. R. S. Lorimer, A.R.S.A., the architect, and carried out in model for the roof of the chapel and ante-chapel, the stalls of the Knights, the stained-glass windows, heraldic bearings, and other details. These were generally approved of, and the architect instructed to have the work proceeded with, but certain matters connected with the stained-glass work were reserved for further consideration. It is desired that the chapel should be completed and ready for opening and consecration on St. Andrew's Day 1910.

The National Portrait Gallery Trustees have acquired by purchase a portrait of William Kent, 1684-1748, architect, sculptor, painter, and landscape gardener, signed by B. Dandridge, and a small portrait-group representing a musical party in Kew Palace, the performers being Frederick Lewis, Prince of Wales, and his sisters. The picture is signed and dated Ph. Mercier, 1733. Both works are now hung in the Hogarth Room—No. XI.

Mr. William Atkinson's death occurred at East Molesey on December 8, at the age of eighty-three. Mr. Atkinson was a member of the firm of Welch & Atkinson, surveyors, of 10 Lancaster Place, Strand, W.C., where he commenced practice more than half a century ago, and in partnership with Mr. Welch, who is still living, carried on an extensive practice. As quantity surveyors they were employed on many large public buildings, and Mr. Atkinson's long and honourable career terminated with the completion of the new War Office. The practice is still carried on by Mr. Stephenson in the same name. The funeral took place at Long Ditton on December 11 in the presence of a number of relations and friends.

FORTHCOMING EVENTS.

Monday, January 3.

Royal Institute of British Architects: General Meeting to consider the Revised Regulations for Architectural Competitions and other matters.

Wednesday, January 5.

Architectural Association: A Life Class opens under the direction of Professor E. Constable Alston.

Monday, January 10.

Liverpool Architectural Society: Paper on "Some Lessons from America," by Professor C. H. Reilly, M.A., A.R.I.B.A.

Surveyors' Institution: Paper on "The Housing and Town Planning Act, 1909," by Mr. John Willmott. The discussion will include that on the paper by Mr. Davidge read on November 22.

Wednesday, January 12.

Carpenters' Company: Lecture on "What is Artistic Craftsmanship?" by Professor Beresford Pite, F.R.I.B.A.

Northern Architectural Association: Paper by Mr. Frank W. Rich, F.R.I.B.A.

Architectural Association: Opening lecture of a course on "European Mediæval Architecture," by Mr. Edward S. Prior.

Manchester Society of Architects: Paper on "Concrete and Concrete Tests," by Mr. A. E. Corbett, A.R.I.B.A.

COPYRIGHT IN ARCHITECTURE.

THE British law is an almost hopeless confusion as to copyright in general, there being still in force a number of statutes which severally deal with parts only of the subject or are amendments to other statutes that so deal. Whilst this heterogeneous body of statute-made law has been growing to its present amorphous condition, various products of the brains of authors have been accorded more or less protection of copyright, but architecture has not up to the present been able to secure recognition nor architects to obtain protection.

Although the Fine Arts Copyright Act, 1862, gives copyright for the life of the author and seven years after in the case of a painting, drawing, or photograph made by a British subject or any person resident in the British dominions, this does not benefit architects in the ordinary way, for case-made law deprives the architect of any right of property in the drawings prepared for an employer, whether the building whose design is expressed on the drawings is erected or not. The Fine Arts Copyright Act also lays it down that on the first sale of any painting, drawing, or photograph the copyright shall belong to the purchaser or person for or on whose behalf a work is made for valuable consideration. Thus the architect not only has no copyright in his building, but except by special agreement has no copyright in the drawings made for the building.

As we noted last week, the Committee on the Law of Copyright, in their report to the President of the Board of Trade, have decided to recommend an alteration of the British law of copyright, which admits architecture to a position alongside of literature, music, the drama, painting and sculpture.

The reference to the Committee was:—"To examine the various points in which the revised International Copyright Convention signed at Berlin on November 13, 1908, is not in accordance with the law of the United Kingdom, including those points which are expressly left to the internal legislation of each country, and to consider in each case whether that law should be altered so as to enable His Majesty's Government to give effect to the Revised Convention."

This Revised Convention modified the basis of international copyright as agreed in the Berne Convention of September 9, 1886, and the Additional Act of Paris and Interpretative Declaration of May 4, 1896. In the Berne Convention, plans, sketches, and plastic works relating to architecture were protected; now international copyright is to be extended to "works" of architecture.

It is thus internationally recognised that an architect's production is a building, not a drawing by which he conveys to others an idea of a building; the drawing is but a means to an end, a tool for the formation of a "work"; the "work" is the building. This is quite a new conception of architecture and architects' work to many of the British public, and especially to the legal portion of the public, who have persistently looked upon an architect as a man who makes a drawing, or "plan," as it is generally described in the law courts, whether it be truly a plan or an elevation or a section or a perspective. The legal view has been that the architect is the man who makes the "plans," and when he has made them, and been paid, he has been paid for making the "plans," and so must hand them over to his employer, with the copyright attaching to them.

The present Committee has been led to form a different opinion to that of the Royal Commissioners of 1878, who considered that it would not be practicable to give the protection now suggested to architects, and the Committee has been influenced to their decision by the evidence that has been brought before them to show that no difficulty in affording this protection has been found in other countries.

When, as will probably be the case, the report of the Committee comes to be embodied in a Bill for the modification and codification of the British law of copyright, this Bill will require very careful watching on behalf of architecture and architects, for it is evident that even on the Committee, who have taken so broad-minded view, there are doubts. Mr. W. JOYNSON-HICKS, M.P., Mr. T. E. SCRUTTON, K.C., and Mr. E. TREVOR LL. WILLIAMS, members of the Committee, are all opposed to the inclusion of works of architecture as proper subject matter for copyright, whilst the report itself suggests that there may be difficulties of proof of infringement and difficulties as to remedies.

We do not see that there would be any great difficulty with regard to remedies. The report suggests that "penalties might be awarded against anyone who copies or is a party to copying," and precludes the idea that it should be necessary for the architect whose building is piratically copied to prove damage in a technical legal sense, or that remedy should be given by the destruction of the building which is a copy. There cannot, we think, be any difficulty in arranging a scale of penalties, which might be based either as a recompense to the original author or as a deterrent to piratical copyism. In some of the older copyright Acts there was a provision that an author whose work was copied might sue for damages and double costs, and herein lies, we think, a suggestion. Suppose an architect has designed an original building for which he has received, let us say, a fee or payment of a thousand guineas, and that this building has been copied. If the infringement, on proof, were followed by

Digitized by Google

a penalty of twice one thousand guineas, half to go to the author of the original design and half to the owner of the building, both the injured parties, the architect and the client, would be recompensed, and the penalty would be in the nature of a deterrent.

The difficulty of proof of infringement is, in our opinion, more imaginary than real. It has not prevented successful actions in other countries of the Union, and it ought not, therefore, to be insuperable in Great Britain.

Copying of architectural design manifests itself in two directions, first, in the copying of the arrangements of plan, using the word "plan" in the architectural and not the legal sense; second, in the copying of architectural features either singly or in combination. Now there is not the slightest difficulty, given a knowledge of the past, in determining whether a plan is new and original or whether it incorporates arrangements that have been previously used. To take the case of moderately sized houses, the non-professional public might think it almost impossible to make a new plan, but a properly explained visit to a garden city, or to the work of any one of scores of our modern domestic architects, would show that not only have new and original plans been produced, but new types of plan have been evolved in the twentieth century. The general public, in fact, have no idea of the amount of original thought that is put into plans, not only by our leading architects, but by hundreds of the rank and file.

Then, with respect to architectural features, it needs but a sound knowledge of the history of the past to determine whether, let us say, a gable is of a form that has been used before or is something that is quite original. Whether the originality is allied with beauty is another matter, but this does not come within the domain of copyright. To a certain extent it is true that modern architectural design is frequently, we might even say usually, based upon that of old work, and no copyright could attach to the use of a recognised "order"; but there is on the continent of Europe plenty of modern architectural detail that one might almost say is like nothing else that ever was, on land or sea. It is not necessarily beautiful, but it is original, and so good matter for copyright.

The only part of architectural design in which we anticipate any difficulty of proof of infringement is composition. Assuming that the details of features used by an architect are not original in design, is he entitled to copyright for any particular arrangement or composition of those features? If someone else uses a similar composition with different detail, original or not, is this an infringement? The difficulty in this respect would probably disappear in most cases by reason of the close connection between composition and plan.

In any Bill dealing with copyright in architecture, it is important that provision shall be made for the infringement of the copyright of an unexecuted design by an unauthorised erection of a building. At present, as far as we, not being lawyers, can understand, a copyrighted drawing may not, under the Revised Convention, be copied by a drawing, nor a building by a building; but we think it is open to an English court of law to decide that a building cannot be an infringement of the copyright of a drawing which has not materialised into a building.

We think it is a matter of congratulation that it is now internationally recognised that the product of an architect's brain is a building, and that he is as much entitled to protection as any other man who produces a work by the activity of his brain.

Of one thing, important above all, we are sure—that the extension of copyright to works of architecture will be beneficial to the art of Architecture. There will be more originality when originality is protected. There will be a greater striving after beauty in originality, because it will be recognised that without beauty the copyright of originality is of very little value. If copyright adds to the sum of both beauty and originality in modern architecture, the Revised Convention will have done a great work for Art.

And when we in Great Britain obtain the benefit of copyright for works of architecture, let us not forget that for it we have to thank very largely Mr. John Belcher, R.A., Mr. John W. Simpson, and the support they have received from M. Georges Maillard, President of the International Literary and Artistic Association.

NOTES AND COMMENTS.

The gratitude of all lovers of art is due to the memory of the late Mr. George Salting for the bequest of his marvellous art collections to the nation. It may be said by cavillers that Mr. Salting was one of those to whom the pleasure of collecting is everything, and that as he could not take them with him it mattered little to him what became of his collections after he had passed to the great beyond. But we are disposed to think otherwise and to believe that, although he did no doubt enjoy to the full the keen pleasure of the collector in acquisition, he had for long regarded himself as one of the nation's champions in the enrichment of the country with valuable works of art. We know that he had expressed to his friends the intention of bequeathing his treasures to the nation, and there can be little doubt that when he "lent" to the Victoria and Albert Museum it was with the full intention that the repayment of the loan would never be required. The sections of Mr. Salting's collection which most interest ourselves are the woodwork and metalwork in the Victoria and Albert Museum, which embrace many examples that are most valuable to a student of architecture, even such as are not actually, perhaps, part of buildings. In view of the great benefits conferred by the testator on the nation we make little of the fact that by the terms of his will the system of classification by material which now obtains at South Kensington will be somewhat dislocated.

London's promised new bridge will be the more worthy of the capital of the Empire and of the Corporation of the City of London if heed be taken to the lessons taught by the lecture on "The Architectural Element in Steel Structures" lately read by Mr. Robert Boyle, B.Sc., before the Architectural Section of the Royal Philosophical Society of Glasgow. The lecturer pointed out the great superiority in architectural character of modern bridges on the Continent as compared with those in Great Britain, and attributed this superiority to the collaboration of architects and sculptors with engineers. This collaboration is quite a different thing to the system of bridge-designing by an engineer with an architectural assistant to cover up the steelwork and draw the mouldings. With all respect to the Corporation we do not want another Tower Bridge to become the laughing stock of every French, German, Austrian, or Belgian artist who comes to view it.

We noted a short time ago the proposition of the new policy proposed to be followed by the George Heriot's Trust in Edinburgh, and at a meeting of the Governors held on the 13th inst. the matter was considered, when Treasurer Leishman moved:—"That in all future feus and sales of ground belonging to the Heriot Trust the conditions should embody that streets on such ground should not be less than 100 feet in width from building line to building line, with a minimum width of carriage and foot way of 80 feet, and that there should be the same amount of unbuilt-on ground at back of houses as at front; further, that no greater height of houses than three storeys be permitted on trust ground; and that in addition for every 10 acres feued there should be left in each particular district at least one acre for public ground, to be used as a recreation ground for public use. It is further resolved that no greater price be exacted for ground for working-class tenements than for villas. It is in addition resolved that conditions of feu or sale should embody restrictions against sub-dividing houses and creating ground annuals."

The Treasurer, in the course of his remarks, urged that wide streets made for the public health and the well-being of the inhabitants, and it limited the number of people that could be placed on a particular piece of

Digitized by Google

ground, and that was his reason for putting down a minimum width of 100 feet. It was not a revolutionary proposal. It was a fair average requirement in a large city, and it was simply going back to the policy of their wise predecessors. Speaking of overcrowding, he said that the Heriot Trust and other trusts had been responsible for a great deal that was evil in the city. It had not been their intention, but that had been the result. They could not have crowded streets and crowded thoroughfares without creating manifold evils. Finally, it was resolved that the matter be referred to a committee for consideration and report.

A STRIKING comment on our own starved and neglected canal system is the American scheme for a deep waterway from Lake Michigan to the Gulf of Mexico. If it is worth while in the Middle West of the United States with its 86,000 miles of railroad track to supplement this by a fine waterway at an enormous outlay, our inland trade is surely being crippled by the want of any such facilities. Of course the trouble here is that the railway companies have obtained financial control of a very large proportion of our canal system, and have deliberately assisted in its impoverishment and disuse. We question whether the policy is a sound one even from the railway companies' point of view. There is plenty of traffic that is not in a violent hurry and that would move long distances if rates were cheaper. Particularly does this apply to building material, and we believe that a revived and improved system of water carriage would pay the railway companies excellently well.

THE final Report of the Royal Commission on Canals and Inland Navigation has now been issued, and the majority of the Commissioners are in favour of State-aid to the development of a reorganised canal system in Great Britain. The minority voice the interests of the railway companies. To architecture a cheap means of transport for bulky material is of high importance. It frequently happens that an architect cannot use the particular kind of stone or brick that he desires in his building because the cost of carriage is prohibitive.

How to build without a contractor is a problem the solution of which has been frequently attempted, and sometimes by eminent architects, but the result is usually unsatisfactory. At Loughton, Staffordshire, some ladies attempted the solution, controlling everything, buying the material themselves, selecting the workmen themselves, and so interfering with the assistance they might have received from the foreman they engaged. The result was an excessive cost of the houses that were built, followed by a lawsuit on a claim by the quasi-foreman, whom the judge found had charged too much.

THE Romans seem to have a tartar in the Syndic of the Municipality, Signor NATHAN, who defies the Higher Council of the Fine Arts and their veto on the proposed union of the three palaces on the Capitol, a spoliation of MICHEL ANGELO'S design. Another matter in which the Syndic sets himself up in opposition to the judgment of all in the city who have any claim to an authoritative opinion on matters artistic, archæological, and architectural is the municipality's scheme for dealing with the Piazza Colonna. Signor NATHAN seems to voice the attitude, whether willingly or unwillingly, of the Socialist power in the municipality. Socialism and Art do not pull together.

COMPETITION FOR NEW PREMISES OF THE LEEDS INDUSTRIAL CO-OPERATIVE SOCIETY, LTD.

THE conditions of this competition appear to be satisfactory as things go. An assessor has been appointed, Mr. F. E. L. HARRIS, A.R.I.B.A., of Manchester, architect to the Co-operative Wholesale Society, Ltd., and he is to "advise and assist the directors in arriving at a decision." Although the directors do not bind themselves to carry out any design, "it is their intention to appoint as architect for the work the author of the first premiated design." The architect appointed to carry out the work is to be paid at the rate of 5 per cent., but this is to include travelling and other expenses. For quantities an additional 1½ per cent. is to be paid to the architect or a quantity surveyor, but this is to include lithography.

The site is somewhat irregular in outline, and about 160 feet long by about 100 feet deep, with frontages to both Albion Street, 43 feet wide, and Bank Street, 25 feet wide. At the ends it is practically hemmed in completely by adjoining buildings.

Accommodation is required for furnishing, boot, drug, and confectionery departments, and for numerous offices, board-room, committee-rooms, &c., and competitors may take it that the planning will be found no easy matter. Plans of each floor and elevation to Bank Street are provided, indicating approximate position of departments and other accommodation, old walls, &c.

The elevation to Albion Street must be of stone to correspond with the Society's adjoining premises, which, by the way, are to be connected to the new on various floors. It is not quite clear from this whether the design of the present premises is to be followed, but this is not quite what would be accepted nowadays as remarkably beautiful.

The drawings required are plans of each floor, front and back elevations, one longitudinal and two cross-sections, to one-eighth scale. No perspective. The drawings are to be sent in not later than March 1, 1910, which, in our opinion, is not sufficient time for any architect who has anything else to do.

ARCHITECTURE: ITS TRUE PRINCIPLES.—XXIV.

By R. OWEN ALLSOP.

PRINCIPLE *v.* TRADITION.

TOO ardent pursuit of fundamental principles is to be decried, whether in science or art. By persistence the mind bereft of its grasp on finite, comprehensible things becomes lost in the incomprehensible infinite. He is wise who, perceiving that the subject of his inquiry is assuming a penumbral aspect, retraces his steps. Persistence has but one ending. Mental obscuration supervenes, and finally the philosopher will declare that to be unknowable which he quite well comprehended as a child upon his mother's knee.

Thus to the plain man space is infinite. There is no need for perplexity on the point. But, as when the frog destroyed himself in his endeavour to rival the bull, so even great minds have been virtually wrecked in efforts to fathom infinite things. The space-cramper, with his fourth dimension, must be allocated to the same class as earth-flatteners. It must be adjudged to be the sign of a healthy mind to vomit out unwholesome mental food. To endeavour to assimilate such, even if not permanently straining the power of right reasoning, institutes stresses that bring about a state of mental fog with inability to draw conclusions from facts plain enough to the plain man.

All inquiries into the absolute genesis of created things, states, conditions and causes, present this danger. As a result hypotheses are founded on false premises, and a whole fabric of theory raised, only to come tumbling down on the discovery of some new, unquestionable verity. For this reason the student of architecture will do well to avoid all kind of root principle study unless aware of the limitations of human understanding. He will be well advised to remain a humble copier of that which is universally pronounced sound and excellent, and look upon old work with the same eye that the artist regards nature. Principles of style are to such safer subjects of study; and whether these or fundamental principles, based on considerations psychological, all in architecture are plainly rounded in by practical principles of building—the laws of equilibrium and stability. It is so very easy for speculative minds to be led astray in formulating novel theories as to causes and origination,

Digitized by Google

as, for example, the beautiful in architecture. Certain postulates are made, certain things and facts seem to harmonise, and the whole becomes a variety of fetish, the outlook being warped until correct judgment on the question involved becomes impossible. The legitimate range of study of prime causes and of genesis must therefore lie well within that boundary where facts are glimpsed but cannot be held, and where ever the horizon retreats before us.

There is another reason for caution in this matter; it is impossible by word or sign to convey sensations and sympathies. We cannot write down in characters the scent of lily or rose. As a practical outcome each one must study and think for himself. The artist and the musician would be quite glad to convey directly and speedily his knowledge and attainments, but that he is unable so to do, the acquired skill of eye and hand not being communicable by words, there being no medium or common plane whereby he can convey that which he would. Again, all knowledge as such is secondary to practice—experience and dexterity gained by constant repetition of acts. It is therefore a great delusion to

FIG. 47.—ST. CLEMENT DANES.

imagine that any kind of discovery, principle, or theorem can furnish a royal road to any human accomplishment—art or science.

The most desirable result of thinking about principle is that it should create an impression that we must needs study and work yet more arduously. The great value of an inquiry into principles is that it instils a desire to reason as distinct from being content to imitate. As matters now stand, each and all may usefully essay—give thoughts and views—on first principles; but none can justly lay down and dogmatise. The real first principles in æsthetics are hard to discern, and are at best perhaps merely glimpsed at times of "good seeing," as the astronomers have it. In place of true fundamentals we conceive any number of secondary or tertiary sub-principles, and unless bounds are set most thinkers could continue to discourse without any very definite conclusions on a group of rules that ramify and sub-divide without apparent end.

All great laws of conduct are mainly negations—"*thou shalt not.*" They are laid down to the end that the right state may be preserved by avoidance of fatal wrong-doing. It is in petty affairs we find such formula as "he shall cause to be constructed." The great rule that main forms of building shall not—according to Western ideas—be broken up like confectionery, in no way applies to, or cramps the hand in, small matters of detail, where fancy is free to roam. There is no sort of compulsion on the artist excepting such as prevents a kind of æsthetic suicide. The possession of a compass does not alone insure the safe voyaging of the mariner. It indicates certain things that prevent his navigating to his destruction, but in no way lessens the arduous labours entailed in crossing the ocean. The knowledge of any amount of right principles cannot alone make that which we like to understand by the term architect, any more than acquaintance with the rules of grammar can make a great author, or familiarity with laws of harmony a great musical composer. Nevertheless, every sound principle is a safeguard against error. In many, if not all, walks of life, it is first essential to avoid wrong-doing; hence the main aim of principles is negative. Such considerations as these should make unnecessary and meaningless that antipathy to first principles so often evidenced by those who appeared to be obsessed with an idea that writers on such will somewhere seek to lay down dogmatic rules and regulations as to the design of this and that feature. Attempts have been made in this way, but every true artist sees the vanity of the method and the reason of this vanity, and pursues his way unperturbed.

Mere rules of negation do not suffice to bring forth active design, and if all laws are in the main *shall nots*, it seems difficult to understand how one may design novelties on principle. Possibly we never do, and do not in the strict sense require so to do. The use of the term "novelty" is misleading, and what we so often term novelty in architecture, and that which so many rightly condemn, is rather the result of the ignoring of all fundamental rule. The elemental parts of architecture should, we cannot but think, be regarded as unchanging and unchangeable. The author uses again and again old set phrases, time-old words, and always the same alphabet. What is required is rather the new grouping of old entities. Let anyone sit down with the avowed object of designing a new "order." He will do one of two things—either produce something which he will find anticipated in the next street the first time he goes out, or something so monstrously offensive to his own eye that he will for ever after forswear novelty and gladly in future adhere closely to traditional forms. Plainly the designer had been engaged on a futile labour; in the one case he had by chance or by skill produced something he at the time considered novel, and in the other set all the canons of art at defiance to secure a monstrosity on the plea of novelty, which variety of the novel no one requires. He may reason from this experience that old columns and entablatures must be regarded as set phrases, unimprovable as a whole, amenable to detail modification, anything like them on the score of æsthetic importance requiring centuries of time and countless brains to evolve. Possibly now and again some master-stroke is made, mostly as an improvement on what preceded, or as a simplification, as when someone cut off the foliations below the Roman Ionic and left us a supremely simple and beautiful capital.

It will be observed in the most admired work of modern architects that spurious and forced "novelty" is conspicuous by its absence. Such designers employ the old symbols and old phrases with novel arrangement, while all detail is marked by a peculiar combination of

Digitized by Google

power (forcefulness) and refinement. The parts are not weak, slavish copies, the work of a completely dominated and semi-paralysed—in a mental sense—worker. The old basic theme perhaps remains. There is the old word or unimprovable phrase, but they have passed through a milling process—the sensitive and active brain—and have emerged (as it may be put) *the same, but different*. The actual difference is perhaps (as it were) a hairbreadth—the turn of a line here, a mere moral impression, so to speak, of the difference between slave and master. The practical result is that the old form suits its new position. It pleases us, not by its so-called novelty, but by the thought instilled, the refinement and the power. It is as though a time-honoured phrase best expressing a certain meaning had been carefully weighed and adjusted to a slightly modified import, perhaps by mere accent, without even new sequence.

The distinction between this variety of design and that of the novelty-seeker is one of patient thought and its application to definite end. In the one case great study and care were concentrated to produce a beautiful object; in the other we get something requiring little thought and supposed to be novel and entertaining by its novelty. To compare the two productions, one is a beautiful thought beautifully expressed—clothed in suitable language; the other mere unintelligible babbling—gibberish. It is at once apparent that to express a thought one must employ intelligible language, and that the more universal the language, the more widely understood; obviously, again, the wider the knowledge of such language the richer and more varied the power of expression. No mere study of erudite principle will extend our knowledge of architectural vernacular or of that which is on a broader footing. The basic signs and the flowery periods must be gathered from the book written in stone, marble and brick; and of the two ways, great principle and little study and little principle and great study, the latter is by far the best and surest foundation upon which to base interesting architectural design. To the earnest and enthusiastic student much study of approved old work necessarily means the gradual, if insensible, acquirement of the principles or grammar of architectural composition.

THE END.

THE ARCHITECTURAL EXHIBITION AT BROOKLYN.

By WM. H. GOODYEAR.

THE relation of architectural history to the general history of art is that of indispensable forerunner and guide to a general knowledge of the subject. Just as a general knowledge of the sequence of geologic periods is a necessary basis and foundation for all studies of evolution in natural history, so also, in the history of art, a knowledge of its periods, of their divisions and sequence, is involved in the very conception of such a study. Now it so happens that the broad divisions of these periods can only be definitely indicated by the historic architectural styles. For example, the essential unity of modern history and of modern art can only be definitely marked out and limited for the art historian by the contemporary use of the Renaissance architectural forms. In like manner the limits of mediæval art, its beginning, its end, its evolution, and even the terms by which its periods are specified, are only to be understood and known after its cathedrals and churches have first been studied.

It is, however, less than a century since this study was formulated, even in its incipient stages. The mediæval monuments are separated from our own time and, above all, from our own interests and modes of thought, by a period of four hundred years.

Moreover, the so-called Gothic of our own time and the other so-called "mediæval styles" in modern use, were unknown before the date of these modern studies. The modern mediæval "styles" are therefore literary, or (so to speak) studio, revivals, inspired by the literary studies of the Middle Ages which first called attention to the subject.

Thus the general study of mediæval architecture may be considered as having importance from three different points of view.

First, it is an indispensable connecting link between the general history of ancient classic art and of modern art. To a general view and knowledge of art history the study of mediæval architecture is therefore essential. In the second place, the study of mediæval painting, sculpture, and decorative art demands a knowledge of terms, facts and sub-divisions of period, which are connected with the sequence of the mediæval architectural styles. In the third place, it is desirable that every competent art critic should be able to judge and criticise or appreciate the modern revivals of the mediæval architectural styles. This is manifestly only to be done after a thorough knowledge of the old buildings, which have been copied, has been attained.

To these considerations, which illustrate the importance and interest of mediæval architecture, may be added the great and notable general interest of the mediæval cathedrals to all cultivated people who have travelled or who intend, or hope, to travel.

That it is one of the missions of an art museum to illustrate and assist the study of the mediæval cathedrals cannot be debated in the negative. An exhibition of architectural casts must, however, always be inadequate to such an end. Architectural casts must be necessarily confined, on account of their large dimensions, to architectural details, and these are of interest, in the first place, to specialists and to architects rather than the general public, for we must know the whole before we can appreciate or value the part. Models are too expensive to be available in even remotely adequate numbers. Thus the enlarged and framed photograph, publicly exhibited, is the obvious recourse. Everything is in its favour. Nothing can be said against it. From this point of view the Brooklyn Museum has made a special feature of architectural photographs enlarged for public exhibition. These have been necessarily made from its own negatives taken in Europe and for this purpose. Its collection has achieved the distinction of having been represented by two separate exhibitions of very substantial dimensions in foreign countries. In fact, the catalogue now in use in Brooklyn was written for an exhibition in Edinburgh, and the dimensions of that exhibition, as far as linear extension of wall space are concerned, were as large as the larger exhibition hall in the eastern wing of the Brooklyn Museum, in which a large portion of the Brooklyn exhibit is now installed.

There are two methods of approaching the study of mediæval architecture. One is to treat it by periods and to illustrate its evolution by typical examples. This method has not, so far, been attempted in the Brooklyn Museum, although it is highly desirable that it should be. The other method is to illustrate the artistic virtues of all periods and to explain the philosophy of this excellence. This later purpose is that of the present architectural installation, for the development of the critical or appreciative faculty demands the aid of contrast, and to judge our own buildings of mediæval style (so-called) we must study the originals.

In this study we find that the first and main difference between new and old is that the modern building is, mathematically speaking, regular, and that the old building is, mathematically speaking, irregular. This irregularity, when obvious, has been generally realised as an element of beauty and as a feature of the picturesque quality which is the greatest charm of the old cathedrals. Such irregularity has, however, been viewed as "accidental." It is true that obvious irregularity was generally an accident in some senses, but an accident that can be easily avoided is hardly an accident in the strictest sense. The point of view that irregularity was not avoided as a defect appears to be more important, and is not inconsistent with the point of view that irregularity was frequently preferred, and this appears to have also been the case.

That irregularities which are not obvious are numerous has not, however, been widely known. Not easily distinguished by the eye, they may, however, be detected and shown by photography under circumstances which demonstrate constructive intention. In other cases this demonstration is found in surveys which show the correspondence of measures as to variations which are asymmetric by pairs in regular sequences of gradation, or which correspond on different sides of a building. In this sense the museum photographs and surveys are interesting and novel contributions to our knowledge of the mediæval churches.

The distinctive feature of the Brooklyn architectural exhibition is its attention to the illustration of such instances of intentional departure from geometrical symmetry in mediæval architecture. The catalogue classifies and records the nature of these departures, and therefore we will not

Digitized by Google

specify them here, preferring (as an indication of the importance of this branch of the study) to quote the names of high authorities who have mentioned the existence of intentional asymmetry in the mediæval cathedrals, or who have given their direct countenance and approbation to the Brooklyn Museum exhibition.

The philosophy of the picturesque quality in mediæval church architecture has, for instance, been eloquently described and analysed by Mr. John Ruskin in the "Seven Lamps of Architecture," and notably in that chapter which is called "The Lamp of Life."

Mr. Ruskin was apparently the first to point out by implication, if not by direct assertion, that the mechanical formalism of modern architecture is a defect, and that the virtue of spontaneous life is the most admirable quality of the mediæval work. For Greek temple architecture the same facts had been previously realised and shown by others, but Mr. Ruskin drew no parallels in this regard, although he might easily have done so.

His point of view is admirably summed up in a passage which follows here. He speaks of "accidental carelessness of measurement, or of execution, being mingled undistinguishably with the purposed departures from symmetrical regularity, and the luxuriousness of perpetually variable fancy. . . . How great, how frequent they are, and how brightly the severity of architectural law is relieved by their grace and suddenness, has not, I think, been enough observed; still less, the unequal measurements of even important features professing to be absolutely symmetrical." There is, perhaps, one improvement to be made in the wording of this passage by the insertion of the word "often," as follows:—"Accidental carelessness of measurement . . . being *often* mingled undistinguishably with the purposed departures," &c.

If the passage were not so understood it would have been illogical in Mr. Ruskin to have proceeded to prove, as he does, that purposed departures from symmetrical regularity can be specified and distinguished in great numbers.

Thus he says, after some pages of instances:—"I imagine I have given instances enough, though I could multiply them indefinitely, to prove that these variations are not mere blunders, nor carelessness, but the result of a fixed scorn, if not dislike, of accuracy in measurements, and in most cases, I believe, of a determined resolution to work out an effective symmetry by variations as subtle as those of nature."

Mr. Ruskin's occasionally erratic and frequently erroneous views on other subjects in art criticism have somewhat obscured the great importance of his contribution to architectural criticism in the "Lamp of Life." Another great man has, however, expressed himself in no uncertain way, and to the same effect, on the same subject, and this authority is the greatest of our time for historic buildings.

M. Auguste Choisy, whose lamented death occurred in September of this year, is the author of a history of architecture which has no rival in precision of expression, in compactness of form, or in the treatment of structural problems. It has no superior in the domain of the history of architecture, whether the book be considered as a chronologic summary, as a territorial guide, or as a matter of fact compendium.

M. Choisy's standing as an engineer is sufficiently attested by his appointment as chief of the French Department of Roads and Bridges (*Ponts et Chaussées*). In this capacity he had made surveys for a French Government railway in the Sahara Desert. His great distinction was to combine and balance in equal perfection the capacities of the engineering expert and of the critical art historian. Hence his utterances as to constructive asymmetries in mediæval architecture may be regarded as decisive. These are the words of his "History of Architecture," after mentioning certain instances of mediæval optical illusions:—"These irregularities are visibly intentional. There are others which must be charged to the account of builder's errors. The distinction between the two is sometimes difficult; but if we consider the original and almost subtle spirit of the Gothic architects we shall be convinced that there was calculation more often than negligence in their work." Another passage says:—"In general, the mediæval architects avoided formal regularity. If they admitted an element of symmetry, as regards the whole, they knew how to break the monotony by an infinite diversity in details." After mentioning that the façade of Notre Dame at Paris has three portals, which were built at the same time and which are all of different forms, he continues:—"These variations give a charming variety to the composition. Our sympathy is awakened by these works in which the author has disdained the too facile use of a repeated pattern, in which each part has been accorded a separate study and an individual attention. Instead of symmetry there is balance, and the unity of impression does not suffer by it."

M. Choisy's interest in the Brooklyn Museum architectural exhibits was frequently and warmly expressed in a multitude of personal letters. One of these was received only about ten days before his unexpected and sudden death. It is of great interest that he should have so often and so frankly insisted on the novelty of the facts which had been brought to his attention by these photographs. This he did, not only as a friend and personal correspondent, but also in an official and public manner. In a session of the Académie des Inscriptions et Belles-Lettres, at which he exhibited some of the enlargements, in August 1905, M. Choisy publicly expressed himself to the effect that "it is to be wished that at least a portion of this precious collection could form a part of our museum collections in France." His latest letter contains the following passage:—"You have opened up a path which it will be sometimes difficult to follow, but which will certainly be fertile in unexpected results and in the rectification of errors which have been too widely accredited. You are already reaping the fruit of the lessons which you have given to other observers. Before you, people were satisfied with plans of factitious regularity. In future these conventional plans will no longer be in vogue, and it will be necessary to publish the real anomalies and their true plan."

A letter received from M. Choisy in December 1907 contains the following passage:—"I have read with lively interest your contribution to the *Journal R.I.B.A.* You should be congratulated on the incident which called for this article, for it has given you an opportunity to unite in one résume all the essential features of your numerous memoirs. One is really thrown into consternation by the extent of your researches; how many monuments we thought to be regular which you have shown to be otherwise, although even the practised eye does not discern it. As for the reason why so many curious facts should have been ignored, you explain it in penetrating fashion by the effects of contrast and, as regards the piers, by the effects of perspective, which cause the lines to converge in the raising direction and thus diminish the effect of the actual widening. . . . In a word, you have inaugurated a method which, in your hands, has revealed a whole world of facts."

The current issues of the *American Architect* will supplement these brief hints as to the significance of the Brooklyn Museum Architectural Exhibition. The articles already published on this subject are of date August 4, September 8, and October 27. Three other articles will follow at short intervals.

The following statistics may be of interest. The number of negatives taken in Europe is about 1,500. The number of framed exhibits is 632. The amount of linear wall space covered by these exhibits, counting each line of hanging, is about 2,000 feet. Among the cathedrals most thoroughly photographed are the following:—The Cathedral of Amiens is represented by 133 enlargements, Notre Dame at Paris has fifty-nine enlargements, Rheims Cathedral has twenty enlargements, the Pisa Cathedral has forty-three enlargements, and St. Mark's at Venice has forty-two enlargements. From the mere mention of these figures it may be gathered that such an exhibition of all the various individual features of certain celebrated cathedrals, taken in detail and at close range, has never hitherto been attempted.

WASHABLE DISTEMPER.*

THE title "Washable Distemper," said Mr. Cruickshank-Smith, in opening the discussion, seems to me to imply an inherent contradiction of terms, but it has, no doubt, been adopted in the present case by the executive of this Society for good and sufficient reasons, which will probably be disclosed in the course of the debate. May I be allowed to clear the ground as regards the question of nomenclature before proceeding further? Each one of the great group of materials which will come under our purview to-night contains water as an essential component part. Hence, if we require a generic name for the whole class, "Water Paint" might be suggested. Sub-dividing this genus on a basis of the pigmentary constituents we might

* A discussion on "The Advantages and Disadvantages of Washable Distemper," held at a meeting of the Paint and Varnish Society, on December 9.

Digitized by Google

classify, on the one hand, those materials the pigment in which is essentially a lime compound—either the hydrate, the carbonate, or the sulphate—and, on the other hand, those in which the pigment consists essentially of a zinc pigment. To the first group the descriptive term "distemper" properly belongs, while to the second group the distinctive description "tempera paint" appears to be appropriate. It is to the latter group—that of the true tempera paints—that I propose to confine my remarks. Britain may justly be said to be the modern home of these materials. In no other part of the world has their production or consumption reached such huge totals as has been the case here. I estimate that not less than 10,000 tons of tempera paint in paste form are produced annually in Britain, and this figure is probably short of the actual output. It is not easy to estimate such figures with perfect accuracy, but I have reason to believe that there is used in Britain annually at least 100,000*l.* worth of the best makes of tempera paint, and of this enormous quantity a large proportion is sold direct to painters and decorators. We are, therefore, dealing with no negligible item in the annual purchases of paint materials in this country, and anyone who attempts to belittle the importance of this branch of the paint industry, or to suggest that the figures I have quoted are not due to some solid and tangible advantages possessed by tempera paints as a class, is surely either grievously misinformed or woefully blind to facts. Let us now get to the kernel of our subject, and briefly discuss the advantages and disadvantages respectively, or may I not rather say the merits and defects, of tempera paints? In such matters, as in most others, the point of view counts for much, and I shall, therefore, attempt to sum up the case as fairly as I can; first, from the artistic; secondly, from the economic; thirdly, from the hygienic and public health; and, fourthly, from the practical painter's point of view.

When we step into the realms of art we are at once outside the region of definite law, and are subject more or less to personal ideals and individual tastes. Whether the vogue in tempera paints has moulded or has been moulded by the general trend of public taste during the last ten years it is not for me to say. This much, however, is obvious, that the increase in the use of tempera paints has been contemporaneous with a marked advance in the taste of the public for plain coloured surface and for matt effects in decoration. Not unconnected with this is the more recent and still growing taste of a large section of the public for what is generally described as period decoration. It is claimed, and I think with justice, that in the hands of a capable craftsman a true tempera paint provides an unequalled medium for the carrying out of decorative schemes of this nature, the infinite variety of tone which can be obtained and the unique colour effects which are capable of being produced being well nigh unattainable by any other means. In the highest class of decorative painting the texture of the surface and the "quality" of the colour effect are of the highest importance, and I venture to submit that the ideal tempera paint is facile princeps as a material whereby the most beautiful effects can be secured on mural surfaces, effects which far surpass those presented by that coldest and most unsympathetic of all backgrounds, the oil-painted wall. Not every water or tempera paint can be successfully used for the purposes I have indicated. Several that I am familiar with, and some of them more than others, possess defects. Perhaps the commonest, and certainly one of the most irritating to the decorator, is their proneness to "rub up" when succeeding coats of the same colour are applied, and this is especially liable to occur with dark colours in which, of course, the proportion of staining material is greatest. There are, no doubt, gentlemen present who will tell us how this defect can be remedied. In this, as in nearly every department of the paint trade, a clear appreciation by the manufacturer of the requirements of the painter tends to dissipate misunderstanding and to promote harmonious co-operation between maker and user.

The relative merits of tempera paints and of wall-papers and other forms of mural decoration fall to be discussed in this connection, and some interesting expressions of opinion on this aspect of the subject may be looked for.

Now we come to the second point, the prosaic but inevitable one of pounds, shillings, and pence. Every year the master painters of the country are wont to congregate in solemn conclave and in an atmosphere of considerable dignity and comfort to discuss "the decadence of painting," to read papers on "Art for Art's Sake," and to laud the noble calling to which they belong. They then repair to their several places of abode and proceed to cut each other's throats by tendering for a painting job at prices ranging from 350*l.* to 150*l.* for the same piece of work. Tempera paints have been a welcome addition to the repertoire of the framer of the low-priced tender. He uses them instead of patent knotting, he primes his new woodwork with them, he undercoats his enamel with them, and he does a hundred and one other things with them which the devotee of white lead, oil and turps would stand aghast at, and the curious part of it is that (provided he is not unreasonably hampered by his specification) he can as a rule, if he knows his business, turn out work which, if we consider the price he is paid for it, is creditable and satisfactory. At any rate such methods are in the opinion of many people better than those which involve the use of knotting at 4*s.* 6*d.* per gallon, reduced white lead at 16*s.* per cwt., and the mixing of boiled oil with copal oak varnish. It is one of the greatest mistakes to imagine that because a paint material is cheap, therefore the cost of handling it will also be low. Contrariwise, a properly manufactured, and therefore a fairly high-priced, tempera paint should not be set down as a material the handling of which involves a cost proportional to its price. The experience of large users of tempera paint is totally opposed to this view. I believe it is generally allowed that, coat for coat, a highly finished tempera paint costs to apply (including the cost of materials) about 33⅓ per cent. more than size distemper, and about 25 per cent. less than oil paint. The economic side of the question is very interesting, and no doubt we shall hear valuable expressions of opinion in the course of the general debate.

It is interesting in connection with the economic aspect of the question to observe the attitude of those who, in the capacity of architects, engineers, and owners of property, regard the question of paint materials from the point of view of their real protective utility or durability. Is a tempera paint, it may be asked, capable of providing a better protective coat (artistic and economic questions being taken into account) than any other ordinary coating? The answer will be sometimes "Yes" and sometimes "No." The very term "tempera" implies some sort of intimate bond or ultimate chemical action between the coating and the surface to which it is applied. It is a matter of common technical knowledge that both the pigmentary and the liquid binding ingredients, in some at least of the best modern tempera paints, are capable of forming hard and weather-resisting crusts or even compounds with the constituents of certain lime plasters and building stones. It cannot, however, be too strongly emphasised that quite different results are obtained when tempera paints are applied to unpainted old lime plaster or Bath or Portland stone and to oil-painted or other inert surfaces respectively. New cement is far from being an ideal ground for any paint material, nevertheless thousands of square yards are annually treated with tempera paint with, as might be expected, a varying measure of success. Unhappily the scientific aspect of paints and painting is little understood by the average architect and engineer, and it is possible, therefore, that the property owner does not always receive the best advice. Questions affecting hygiene and public health are kept well to the fore nowadays, as recent legislation and Home Office regulations bear witness. No inconsiderable part of the popularity of certain tempera paints has been due to the fact that neither in their composition nor in the results of their application and use can they be considered as other than strictly hygienic and sanitary materials. It is interesting in this connection to note that at least one tempera paint in Britain is, I believe, accepted by the factory inspection department of the Home Office as a "paint" in the sense that walls treated with it need be repainted only once in three years instead of once every twelve or fourteen months, as is the case when a distemper is used.

The attitude of the practical painter towards tempera paints is from the very nature of things an epitome of the foregoing considerations. To the painter who is master of his craft, and who is untrammelled by sentiment in such matters, the advantages or merits I have quoted in favour of tempera paints will readily appeal, and he may even be able to enumerate other points in which these materials stand pre-eminent. Criticism, however, is the leaven of knowledge, and there are certain points in connection with tempera paints which the practical painter does not forget to emphasise. One is that a tempera painted surface cannot, he says, be washed. Another is that tempera paints lack opacity and that good work cannot be done with less than four or five coats. Yet another criticism is that under the influence of bright sunlight out of doors curious colour changes sometimes occur, and a fourth objection is that under certain conditions indoors the paint becomes decomposed on the wall and spots or streaks of gummy matter appear. I have also heard criticisms passed as to the smell of tempera paint. I see in the room representatives of manufacturing houses, paint dealers, and practical experts, all straining at the leash to repudiate the innuendos and answer the criticisms I have suggested. I

shall therefore leave the matter thus in the hope that the remarks which will fall from different members of the audience will result in the clearing up of misapprehensions, the removal of prejudice, and an increase in our common fund of technical and practical knowledge.

I have to thank Mr. William Fourniss and Mr. J. A. Christie respectively for enabling me to illustrate, by means of the panels which are displayed, typical decorative effects obtained by the use of a tempera paint.

Mr. J. Russell Thornbery said that in listening to the paper his mind was carried back a good many years, for he remembered the difficulties experienced a quarter of a century ago, but now water paint was accepted throughout the civilised world as a suitable and reliable material for wall surfaces. It was curious, however, that during those years there had been a corresponding increase in the gloss surface from the flat, and the increase of glossy surface had accompanied the increase of the matt surface. Mr. Smith had alluded to the spots which appeared so often and formed tears on the surface. The fault would not be found in the best water paints, for it was due to the absorption and extraction from the surface of some of the gelatinous matters in the paint. The surface should be such that the condensation could run down the surface of the paint, and it was well known that water paint could be made to resist atmospheric condensation. Owing to the cutting of prices in tendering for work rubbish was placed on the market, and the whole class of material known as water paint came to be depreciated, whereas good water paint would stand well used in either inside or outside decoration. Of course, a good deal of the permanence would depend upon the colours selected. Many water paints were tinted up by builders and painters without their having any knowledge of how the original material was prepared, with disastrous results. Then, again, carelessness in mixing would produce bad effects, but granted that ordinary care was taking in mixing and application, the speaker said there was no reason why permanent and excellent work should not be accomplished with water paints.

Mr. J. H. Christie suggested that there were so many classes of water paints it was difficult to consider the advantages and disadvantages of the material and arrive at a definite conclusion. Certain water paints partook more of the nature of ordinary sized distemper, and there were others which might be classed to some extent as oil paints. In the different classes they found advantages and disadvantages, but the man who could justify his position as craftsman or practical painter should know how to suitably select his material. The speaker said Mr. Smith had not mentioned in the list of difficulties suggested by him the great one of obtaining a uniform and flat surface on a wall which had been made up or repaired with plaster of some kind. Such walls were responsible for a good many of the complaints brought against water paints. The parts made up presented a different texture and surface, since they would be more absorbent, and care should be exercised to stop the porous nature of new surface.

Mr. Millar was in favour of a wider application of water paints as against materials the components of which contained size, which he described as a semi-putrid matter. Water paints too were cheaper and could be applied more quickly, and as a filler or primer of woodwork the material overcame a trouble which so often confronted the decorator. They were also as reliable for outside work as for inside decoration, and the colour was always true. He believed that painters sometimes expected too much from the material, and belittled its qualities when used under conditions in which oil paint and wall paper had failed to stand.

Mr. C. Harrison Townsend, F.R.I.B.A., said he would like to be sure whether they could talk indiscriminately of distemper and tempera. In the former he recognised a material which was neither, on the one hand, quite fluid and transparent or thick and viscous like oil, and in tempera he understood the application of perfectly fluid and transparent colour to an already prepared ground. He wished also to know whether anybody could tell him that there was such a thing as a washable distemper, by which he meant a distemper which could be sponged over and afterwards regain its original tone.

Mr. William Fourniss considered any paint which obviated the risk of lead poisoning was superior to oil paint, though he did not agree that better quality of tone and quicker application could be obtained in water paint than in fresco.

Mr. J. G. McIntosh considered that lead poisoning was brought about by dirty habits, and a colour therefore containing lead could not be held accountable for accidents when those who used it had no regard for cleanliness.

Mr. A. S. Jennings was a little surprised, he said, that the discussion had not included a comparison between water paints and wall papers. There was a good deal to be said for both as means of decoration. In connection with wall papers, he thought the law should be enforced against the practice of placing a clean paper over a dirty one. Whatever might be said against the semi-putrid matter contained in size, it was a worse fault, he believed, to cover an already soiled paper, and for hygienic reasons the practice should be made illegal.

Mr. George Line, taking up the suggestion of the last speaker, referred to the relation of wall papers to water paints. It would be admitted, he said, that the general public appreciated the wall paper beyond any other form of wall decoration which could be adopted at low cost. It was quite possible and probable, even in regard to an admitted increase in the use of water paints or the decoration of the apartments of the private house, that the public were likely to tire of a plain painted wall surface more frequently than they would tire of the printed wall paper, and consequently would revert to the use of wall papers. On the other hand, the standard of public taste (never a very high one) was certainly being raised, though but slowly. The speaker therefore anticipated that the good points and the proper use of plain paint in the decoration of the house were likely to be increasingly recognised. The use of paints would consequently increase, but not to the extent of affecting to any marked degree the use of wall papers. He was more inclined to that view, because in the decoration of the average house the questions both of time and cost entered very largely. If it could be anticipated that paint manufacturers would be able to supply paints at such low prices and with such despatch as to compare favourably against the same costs incurred in the use of wall papers, then they could regard the prospects of a largely increased adoption of paint as correspondingly brighter. But even should such a favourable comparison materialise—and the speaker considered it improbable—he said he would still believe that the wall paper would maintain its popularity because it was less official and more in keeping with the British idea of homely comfort, and was generally regarded as more complementary to the furnishing itself—in fact an item of the furnishing of the house when selected with judgment and taste.

DETAIL OF COMPETITION DESIGN FOR BERKSHIRE COUNTY COUNCIL OFFICES, READING.

WE now give two more examples of modern detail as exhibited in the recent competition for the new County Council offices for Berkshire at Reading. The authors of these are respectively Messrs. Nicol & Nicol and Messrs. North & Robin.

The Northumberland education committee have decided that, notwithstanding the decision of the Local Government Board, the erection of a school and caretaker's house at Morpeth, at an estimated cost of 8,600*l.* and 320*l.* respectively, be commenced forthwith. The Local Government Board consented to a loan of 7,500*l.*, but would not consent to the full loan applied for. The committee decided that the educational needs of Morpeth should be looked after, notwithstanding the rebuff. With regard to the items for which the Local Government Board would not give their consent to a loan, the Board are prepared to consider them when they are presented with a total bill of cost. If they disallow any of the amount expended, the difference will have to be paid out of the rates. A discussion ensued as to whether the Local Government Board would decline to sanction the borrowing of any portion of the money required if the committee built the school before their consent was given to the entire scheme. It was eventually agreed that such a course was not probable, and the report was adopted.

THE PRACTICAL ADMINISTRATION OF TOWN PLANNING POWERS.*

(Concluded.)

How the Act Affects Existing By-laws.

IT will be observed that instead of town planning schemes being subject to existing by-laws and regulations, these by-laws have to be made subservient to the town planning schemes. This is as it should be. Much of the benefit to be obtained under the Act will be in enabling authorities to vary the by-laws in accordance with special circumstances. There is no further reference to by-laws in this part of the Act, but section 44 of the first part of the Act has an important bearing on town planning schemes. It reads as follows:—

"If the Local Government Board are satisfied, by local inquiry or otherwise, that the erection of dwellings for the working classes within any borough, urban or rural district, is unreasonably impeded in consequence of any by-laws with respect to new streets or buildings in force therein, the Board may require the local authority to revoke such by-laws or to make such new by-laws as the Board may consider necessary for the removal of the impediment."

By-laws at present in force do not allow for the fact that the arbitrary division of the country into urban and rural districts is misleading. An "urban district" may be almost purely rural, and a "rural district" may have within its boundaries a population of thousands concentrated in a town or large village. By-laws cannot, therefore, be suitably and fairly prescribed for "urban" and "rural" districts as such. Those for both districts should be capable of at least three different interpretations, according to three clearly specified sets of circumstances or conditions. The local authority should have power to apply the same by-law in three different ways, or to adopt one of three alternative by-laws for:—

1. The area of any district which has grown up prior to the by-law period.

2. The suburbs of towns and villages or any area of vacant land within their boundaries which come within the definition of the Town Planning Act, as "land likely to be used for building purposes." By-laws should not only prevent bad sanitation, they should encourage sanitary well-doers. On new building areas the man who erects say ten houses to each acre should have some concession given to him as compared with the man who erects say thirty to forty houses to each acre.

3. The purely rural parts of urban and rural districts which are likely to remain agricultural.

It is needless to say that the suggestion is not that by-laws should be capable of interpretation to suit the ideas of local authorities or surveyors. They should be capable of a certain elasticity, but this should be subject to clearly specified conditions attached to each by-law, outside of which no departure can be made or discretionary power exercised. Any such departure should only be possible in the direction of encouraging more healthy conditions, particularly in regard to the provision of air space. For instance, any permission to reduce the width of a non traffic street should be subject to the authority getting a *quid pro quo* in the form of a wider street where required for a main thoroughfare or additional open spaces for children's playgrounds or general recreation. Of course, where 24-feet streets are permitted, the minimum distance between the building lines should still exceed 36 feet

* A paper read at the Guildhall, London, by Mr. Thomas Adams, on December 10.

Digitized by Google

and should in fact not be less than 50 feet. The question of curtilage round the houses should not be determined by the faulty method of basing it on the width of streets or a minimum of paving at the backs of the houses, but by the determination of the building line and the limitation of the number of houses to be erected to each acre. It will be observed from sub-section 59 that for the first time in an Act of Parliament provision is made for limiting the number of buildings that can be erected on any acre of land according to what the Local Government Board considers as reasonable, having regard to the nature and situation of the land. Undoubtedly, one of the chief causes of unhealthy conditions and overcrowding is the extent to which new houses are being closely packed together on newly developed land. If, however, there is to be any considerable limitation to the number of houses that can be erected on each acre, provision must be made for cheapening the cost of land development. By-laws must therefore be made sufficiently elastic to provide for this. Where roads are constructed solely for the domestic requirements of the houses, they should be limited in width to the needs of these houses. This is especially so where large gardens or open spaces are provided. On the other hand where through thoroughfares have to be constructed they should be more adequate than at present; but the cost of enlargement beyond a certain minimum width should be met by the community as a whole, except in so far as it can be met by compensation from the owners whose property may be improved by their construction.

We thus see that town planning will not necessarily increase the expense of development, but rather the reverse. The time at my disposal does not enable me to refer in detail to practical examples, but on a number of estates in different parts of the country which I have laid out, or assisted in laying out, as garden suburbs during the past two years, the presence of arbitrary by-laws has in almost every case necessitated the crowding of more houses on each acre of land than was necessary or desirable in the interest of public health. Whether the owner pays for this expensive development or not it is invariably added to the cost of the dwellings, and consequently paid for by the tenants, either in the form of increased rent or reduced amenities.

Suspension of Statutory Enactments.

In cases where the suspension of statutory enactments are considered necessary parliamentary approval must be obtained.

Responsibility where Land in Different Districts.

Where the land is in the area of more than one local authority, one authority may be responsible for the scheme, or a joint representative body may be constituted for the purpose. In London County the London County Council shall be the responsible body.

Procedure Regulations.

The Local Government Board may make regulations for regulating the procedure to be adopted with respect to applications for authority to prepare schemes, and all subsequent steps, reports and enquiries. Provision shall be made by these regulations:—

(*a*) For securing co-operation with owners and other persons by means of conferences and such other means.

(*b*) For securing that notice of the proposal to prepare or adopt the scheme should be given to any Council interested.

(*c*) For dealing with the other matters mentioned in the fifth schedule to this Act.

Fifth Schedule—Procedure.

We now come to deal with the fifth schedule, which will have an important bearing on the working of the Act. This schedule gives us the order of procedure as follows:—

1. Procedure anterior to and for the purpose of an application for authority to prepare or adopt a scheme:—(*a*) Submission of plans and estimates; (*b*) publication of notices.

2. Procedure during, on and after the preparation or adoption and before the approval of the scheme:—(*a*) Submission to the Local Government Board of the proposed scheme, with plans and estimates. (*b*) Notice of submission of proposed scheme to the Local Government Board. (*c*) Hearing of objections and representations by persons affected, including persons representing architectural or archæological societies or otherwise interested in the amenity of the proposed scheme. (*d*) Publication of notice of intention to approve scheme and the lodging of objections thereto.

3. Procedure after the approval of the scheme:—(*a*) Notice to be given of approval of scheme. (*b*) Inquiries and reports as to the beginning and the progress and completion of works, and other action under the scheme.

4. Duty, at any stage, of the local authority to publish or deposit for inspection any scheme or proposed scheme, and the plans relating thereto, and to give information to persons affected with reference to any such scheme or proposed scheme.

5. The details to be specified in plans, including, wherever the circumstances so require, the restrictions on the number of buildings which may be erected on each acre, and the height and character of those buildings.

There has been some criticism of the order of the steps to be taken under this schedule, but personally, at this stage, I see no grounds for such criticism, although no doubt subsequent amendments may be necessary in the light of experience. Attention may be drawn to the implied invitation in the schedule for schemes to include provisions for limiting the number of houses to each acre.

Compensation.

It is obvious that the success of town planning as understood by the Act will be determined not only by its desirability, but also by the economies with which it can be carried out. I have already referred to possible economies as a result of varying the by-laws. There is also the comparative economy of the procedure necessary to obtain sanction for a scheme. The Act provides for further economies in regard to the compensation to be paid to owners. Compensation will be paid to anyone injuriously affected, but there are important reservations. The very nature of a town planning scheme suggests the possibilities of great saving as compared with schemes of reconstruction carried out when the public need for an improvement becomes desperate. Street improvements in our cities and towns under existing laws are anticipated by private individuals long before they are executed, for the simple reason that they are never executed till the need for the improvement is apparent to everyone.

Economies which can be Effected by Town Planning Schemes.

Under town planning you may look twenty or fifty or more years ahead and you only compensate for the damage done at the date of the application for authority to prepare the scheme. (Sec. 58, sub-sec. 2.)

"A person shall not be entitled to obtain compensation under this section on account of any building erected on or contract made or other thing done with respect to land included in a scheme after the time at which the application for authority to prepare the scheme was made or after such other time as the Local Government Board may fix for the purpose.

"Provided that this provision shall not apply as respects any work done before the date of the approval of the scheme for the purpose of finishing a building begun or of carrying out a contract entered into before the application was made."

Observe the enormous possibilities of this section in the direction of preventing claims being built up when an improvement comes to be effected, of limiting the speculative instinct of enterprising local financiers, and of encouraging local authorities to prepare town planning schemes out of consideration of economy. It has been suggested that one of the weaknesses of the Act is the absence of compulsion on local authorities to prepare schemes whether they like or not. I fancy that when the possible saving which may be effected under these schemes is realised no sort of compulsion will be necessary. Again, if any property is increased in value by the making of a scheme the authority carrying it out may recover half of the amount of the increase. The opportunity of recovering this half of the increase represents a great advantage to local authorities compared with what is possible under the existing law.

A single arbitrator appointed by the Local Government Board shall determine any question of compensation under this section.

If a scheme is revoked a person who has incurred any expenditure in order to comply with it will be entitled to recover the amount of this expenditure in so far as it is rendered abortive by the revocation. He will not, apparently, be entitled to any claim for injury caused to his property by holding it out of the market, or due to any uncertainty caused by waiting for the scheme to be executed. It is therefore important that a scheme should not be hurriedly or inconsiderately approved, as its revocation might lead to hardship where owners were compelled to accept a scheme against their wishes.

I have already referred to section 59, which provides that no compensation can be claimed by reason of provisions which could have been enforced as by-laws, or provisions which for purposes of securing amenity limit the number of houses which may be erected. They are of extreme importance.

Acquisition of Land.

Land may, of course, be acquired by agreement, and procedure for compulsory purchase is greatly simplified com-

Digitized by Google

pared with the procedure under previous Housing Acts. These amended provisions are set out in the first schedule to the Act. An order has to be submitted by the local authority to the Local Government Board putting in force the provisions of the Lands Clauses Acts. The order will be duly made if confirmed by the Board. No additional allowance will be made on account of the purchase being compulsory. Any question of disputed compensation shall be determined by an arbitrator appointed by the Board. If a person interested in the land objects a public enquiry must be held in the locality by an impartial person, not in Government employment, to ascertain whether the land is suitable and whether it can be acquired without undue detriment to the owners. If the report is unfavourable to purchase the order shall be provisional only and shall not have effect unless confirmed by Parliament.

Powers of Local Government Board in Case of Default.

Section 61 confers powers on the Local Government Board to compel a local authority to adopt a scheme or to carry into effect a scheme which has been confirmed. The most notable provisions in this clause are those which enable representation to be made to the Local Government Board by any person or persons, and the power it gives to owners of land to initiate a scheme. As an alternative to compelling an authority to prepare a scheme where it thinks this necessary, the Board may approve a scheme submitted by an owner of land as if it had been adopted by the local authority.

Co-operation of Private Owners.

I consider this provision of great value. Whatever suspicions may be entertained regarding owners of land—and they are in very many cases unfounded—they are usually better qualified to exercise judgment and foresight in regard to the larger issues in connection with the development of land than are many members of our local authorities. Of course, I say this without any disparagement to the ability and disinterestedness of local representatives. But on questions of land development many owners are peculiarly expert and capable of exercising more foresight than those trained in commercial pursuits. Under this Act the power of the selfish owner to benefit himself too freely from public improvements is much restricted, and, that being provided for, it is well that every encouragement should be given to owners to initiate schemes of development on sound lines. This being so, almost as much may be expected for a time from the initiative of large owners of suburban land as from local authorities. What is wanted is broadminded tolerance on the part of all concerned. Housing reform suffers as much from the extremes of many of its friends as from the greed of speculative owners of land. What is often interpreted as selfishness on the part of owners is nothing more or less than resistance to the uncompromising hostility of extremists. This Act invites co-operation between local bodies and owners, and much depends on the spirit in which these two parties enter upon their negotiations. It is true that many of the small speculative owners, and probably some of the large ones, may have to be brought into line against their will, just as, on the other hand, some authorities will have to be made to appreciate the foresight of landowners in their districts. But, generally speaking, I feel that much may be expected from this co-operation, and much of the success of the Act will depend upon it.

I feel some pride in having been the adviser of the owner who initiated the first scheme of this kind in this country, and I look forward with great hope to the future working of the Act in this direction.

Future Town Planning.

It is obvious that there are two ways in which most of the town planning in the country will be carried out under the Act. One will be by the action of local authorities in developing suburban estates of their own, or in purchasing land for the special purpose of controlling its development; the other will be by the co-operation between local authorities and private owners of land to secure the layout of the suburbs on right principles. No one who is fully acquainted with the character and conditions of English local government will deny that most schemes, at least for some years to come, will be carried out by the second of these methods. Landowners who are favourable to this method of development will be in a position to render great public service by co-operation with the authorities and without any real sacrifice of their legitimate interests. The excellent work which is being done by co-partnership societies under the able leadership of Mr. Henry Vivian, M.P., both in erecting houses and in planning large and small areas on the right principles, will be greatly and deservedly stimulated by the Act.

Local authorities that are broadminded enough to consider the future gain to their towns and districts by incurring the expense of preparing plans for the development of the whole of the vacant land within and surrounding their boundaries, will learn to appreciate the value of their work, its economies to the ratepayers, its commercial value to their town or city, its power to elevate the character, inculcate the love of beauty among the citizens, and generally to awaken a civic consciousness that will help in the solution of most of our social problems. It will be appreciated in their own day, but much more in the days to come. This will be moderately so in the case of those authorities who fulfil their bare duty, but it will be eminently so in those cases where the work is taken up in the right spirit by the right men, and carried out on scientific principles with proper consideration of every aspect of civic life and growth.

SHORT METHODS OF CALCULATION FOR CHECKING REINFORCED CONCRETE WORK.*

By E. FIANDER ETCHELLS, F.P.S., M.M.A., A.M.I.M.E.

(Concluded from last week.)

LET us take another example and work it out both ways. Let us take a rectangular beam of the following dimensions:—

Breadth = 8 inches.
Total depth = 16 inches.
Cover of rods at underside = $1\frac{1}{2}$ inches.
Reinforcement = 3 rods $\frac{3}{4}$ inch diameter.

The distance from the underside of the beam to the centre of gravity of the three rods will be $1\frac{1}{2}$ inches + $\frac{3}{8}$ inch = $1\frac{7}{8}$ inches.

The effective depth of the beam will be 16 inches − $1\frac{7}{8}$ inches = $14\frac{1}{8}$ inches.

The value of $bd = 14\frac{1}{8}$ inches × 8 inches = 113 square inches.

The area of one rod $\frac{3}{4}$ inch diameter = 0.44 square inch.

The total area of the tensile reinforcement $A_t = 0.44 \times 3 = 1.32$ square inches.

Let p = the *percentage* of steel, then

$$\frac{1.32 \text{ sq. in.}}{113 \text{ sq. in.}} = \frac{p}{100}$$

Multiplying both sides of this equation by 100, the hundreds on the right-hand side will cancel out, and we will get

$$\frac{100 \times 1{\cdot}32}{113} = p = 1{\cdot}17$$

That is, the percentage of steel to the area $bd = 1.17$ per cent.

Using the diagram for finding the position of the neutral axis, we find that

$$n = 0.44d.$$
$$= 0.44 \times 14.125$$
$$= 6.21 \text{ in.}$$

The area of concrete in compression (*i.e.*, the area above the neutral axis)

$$= b\ n = 8 \text{ in.} \times 6.21 \text{ in.}$$
$$= 49.68 \text{ in.}$$

The stress at the compressed edge will be 600 lb. per square inch.

The compressive stress at the neutral axis will be zero.

The mean stress will be $\frac{600 + 0}{2} = 300$ lb. per square inch.

Expressing this in thousands of pounds, so as to reduce the number of figures, we can say that the mean stress per square inch will be $\frac{300}{1{,}000}$ or ·3 thousands of pounds.

The total compressive force above the neutral axis $= .3 \times 49.68 = 14.9$ thousands of pounds (or 14.9 milals).

Now, the centre of pressure will not lie in the centre of the area above the neutral axis; it will be nearer to the compressed edge. Its calculated position is one-third of n from the compressed edge—that is to say, that the centre of compressive force is 6.21/3 = 2.07 in. from the compressed edge of the beam.

The lever arm [or the arm of the couple formed by the compressive force above and the tensile force below] will be the distance between the centre of pressure and the centre of gravity of the tensile reinforcement.

That is $d - \frac{n}{3} = a$, where a is the arm of the couple.

* A paper prepared for the meeting of the Institution of Municipal Engineers on December 11.

Digitized by Google

In our case

$$a = 14{\cdot}125 - \frac{6{\cdot}21}{3}$$

$$= 14.125 - 2.07$$

$$= 12.055 \text{ in.}$$

The resistance moment in terms of the compressive force

= Compressive force × lever arm

= 14.9 × 12.055 in.

= 179.6 thousands of inch-pounds

= 179.6 milal inches.

Now this has been worked out fully, but by using our approximate rule we get

$$\left(\frac{90 + 20 \times 1{\cdot}17}{1{,}000}\right) b\, d^2$$

$$= \left(\frac{90 + 23{\cdot}4}{1{,}000}\right) \left(1{,}596\right)$$

$$= 181{\cdot}1 \text{ thousands of inch-pounds.}$$

Comparing this result with the previous 179.6, it will be seen that this approximation is sufficiently accurate for all practical purposes, more especially having regard to the inevitable variability of concrete.

The resistance moment in terms of the tensile stress will be

$$A_t \,.\, t \,.\, a =$$

= 1.32 sq. in. 16.8 milals × 12.055 in.

= 270 thousands of inch-pounds nearly.

Thus the tensile resistance greatly exceeds the compressive resistance, as was to be expected.

These examples have been set out at length only in order that the relative speed of the two methods may be contrasted and the results compared.

TOWN PLANNING IN ANCIENT AND MODERN TIMES.*

SCAMOZZI, architect of the Procurazie at Venice, and one of the great theorists of the Renaissance period in Italy, uses, in relation to the difference between town planning in antique times and in his own, in his book "Ideas about Universal Architecture," the words:—"La differenza de tempi tra gli antichi e noi ha causato tanta diversità nelle cose come anco nel fare le citta" (The difference between ancient times and our own in regard to town planning is, as in regard to everything else, a great one). Vitruvius was for a long time the authority in this field, until a great intellect like Michel Angelo broke away from the ancient expressions of form to the advantage of the views of his time. The architects of the Renaissance sought, as in the age of Pericles, to secure the artistic unity of the towns, and the problem therefore assumed quite another standpoint than that which seems best for our time. Now quite other factors are of controlling influence. The traditions of the Renaissance maintained this in the planning of the princely municipal foundations of the eighteenth century. No greater difference however can be found than that between our age and that of any period of the past in reference to town planning and town enlargement. During the different ages of the past the principle of the greatest protection against attack from the outside found expression in the building of a circle of fortifications and the placing of certain boundaries to local extension. In our time the principle of unlimited expansion prevails. The old towns, whether they grew or were planned, represented unity, exclusion, and grouping around a political or religious centre. Their development was in connection with this centre. They represented, as Professor Eberstadt says, the centripetal principle, whilst in modern times the centrifugal principle prevails. In modern times we seek to extend the settlements always farther out into the meadows, the woods and the fields. In old municipalities they distinguished between the "old town" (Aldstadt) and the new one (Neustadt)—that is between the original nucleus and what was created later. The town and its population formed a concentrated totality for the outsiders. Now many quarters of a town are larger than whole towns formerly were. The distinction generally is between the centre, east end, west end, north side, and south side. In these cardinal points live men who are almost antipodally removed from one another. Many a man who lives in the west end of a great city knows only from the geography of his country that an east end exists and that men also live there.

In former times the centre around the royal castle, the oldest cathedral and the town hall was considered as the best situation for the residence of the principal wealthy citizens. Traffic was concentrated here. Foreign nations had their trading place here. The periphery and the quarters nearest the gates were on the other hand looked upon as less respectable. Now the situation has entirely changed. On the one hand wealthy citizens leave the dwellings at the centre for more roomy ones in more open situations, and at least in most of the German towns which have grown rapidly, the quarters on the outskirts and the suburbs suffer from the overflowing of the masses of the working class. There one sees the worst features of the density of population. Only those sections have remained central to which money flows in the form of taxes and rates, and these places show indeed a constantly increasing magnetic power.

If I stayed to consider antique towns with their great sanitary arrangements for sewage disposal, drinking water aqueducts, public baths and so forth, and considered the conditions of the towns of the middle ages and later times, with reference to their hygienic arrangements and precautions, then my time would soon be exhausted. Let me however point out that it was not an accident that the plague and other pests often nearly exterminated the population in old towns, and that the cholera appeared—even in our time—in serious form. It is only necessary to refer here to the last Hamburg epidemic. Our age, in which the public weal, in relation to sanitary work at least, is not merely a phrase, has however now taken measures to secure radical hygienic regulations to improve the faulty conditions of the old towns by sewerage and providing good drinking water, by the creation of air and light, and by limiting the exceeding closeness of the buildings. In reference to the last point, the relation between the built up places and those to be left open in the great towns is not to be considered as satisfactory everywhere. The regulations of every kind for the protection of health stand, on the Continent at least, before the greatest and most difficult problem of sanitary politics, the erection of sufficient healthy and cheap dwellings for the working classes.

In most of the continental capitals which have grown rapidly during recent decades the want of sufficient dwellings is not a new condition, but it is significant that this want has everywhere to-day become one of the most important points in the programme of the difficulties of our great towns. In Prussia, for example, more than 90 per cent. of the town population are obliged to live in small dwellings of one, two or three rooms. One might think that the greater part of the problem of town planning consisted in the most reasonable solution of the housing question. It might, but it does not. Here is one of the greatest differences between ancient and modern towns. The ancient towns, often several times enlarged, gave "room to live" to their population. That is one of the reasons of their artistic character. Modern towns are continually enlarged, but, nevertheless, great parts of their population have not sufficient room to live. This is one of the reasons of the inartistic expression in the physiognomy of modern towns.

If George Haw, who presented you ten years ago his book, "No Room to Live," had wished to study the same conditions on the Continent, he would not have had to speak only of "the plaint of overcrowded London." We are here before a very dark point of the building of the modern town. The housing question stands in the most intimate connection with everything which to-day is comprehended under the title of town planning, because in the domain of the protection of health it makes the most imperative demands. Half a century ago this was recognised only in its barest outlines. In more remote times practically nothing was known of the principles of hygiene in building towns, otherwise it would not have been possible for palaces, filled with works of art, even royal residences, to exist, in which no regard was taken for sanitary conditions. If this was the case with princes, one can easily imagine what the municipal provisions of this kind were. In this respect our age stands in the most pronounced contrast to the past. The question of the artistic difference between the appearance of the ancient towns and those of modern times can only shortly be considered here. Whoever makes a direct comparison of the old and the new with respect to beauty alone will find without doubt more beauty in the ancient towns. They are associated with the earth on which they stand. Leo Battista Alberti demanded a correspondence between the town plan and the locality. The engineering capacities, which are always developing in a greater degree and which make the removal of every local obstacle possible instead of going over it, cause our time to lose more and more the security in artistic things. It is for

* A paper by Professor Berlepsch Valendas, B.D.A., of Munich, presented to the National Town Planning Congress at Westminster.

Digitized by Google

us to find for changed conditions the new artistic expression and to find ways which are in harmony with the powerful mechanical aids of our time. Former ages did not know these means, and, therefore, the command of nature was a controlling one. The transition process which transformed creative artistic power into inventive power did not find at once the æsthetic expression for its creations. Where it, independent as it is in its entire nature, inclined to the antique and used the garments of our ancestors, much greater mistakes were made than where it showed itself unadorned in its true nature. The unadorned expression has created fewer works that offend the eye than the endeavour to cover quite new forms (corresponding in material, construction and workmanship to our needs) with a mantle of the past, and thereby to bring form and contents into discord. Herein lies the reason of the low condition of architecture in the last half of the nineteenth century. It did not find the artistic expression which had to run parallel with a powerfully active time; it lived rather by borrowing. Certain principles in town planning will no doubt remain constant, such as the architecture of public and private buildings in their relation to the streets and places on which they stand, the construction of streets in respect to public places, the erection of fountains, of monuments, and of works of combined architecture and sculpture in relation to the surrounding architecture, &c. (In this respect many tasteless things have been done, for tastelessness is more international than anything else.) But to such permanent demands a great number of problems of an absolutely new character have been added. The most important point in this respect—a point which has produced an entire change as compared with former times—has arisen in regard to modern traffic facilities. The time can yet be remembered in continental towns when—as in Holy Russia to-day—the gates were shut at nine o'clock as a matter of course against all intercourse from outside. Now all this is changed. To-day the transport of food alone, that must come from all directions without interruption to a town of medium size, takes place at distances the overcoming of which would not have been possible at a time when there were no railways. Economic self-management by the towns, and the impossibility of a solution of the question of provisioning them from a distance were the simple reasons for the extraordinarily slow increase of the populations of the towns in the old times. The provisioning of the towns enlarged by new means of traffic have made the rapid increase of the town population, at the expense of the rural, possible. A large number of factors of development have, moreover, co-operated contemporaneously to force the building of towns in our time into entirely new directions. Traffic alone is not responsible for this change, and, indeed, may be regarded as one of its results. The immigration to the towns and the resulting change of the condition of the population, not in numbers alone, but with reference to the economic conditions, are the most important factors of the transmigration. In the ancient town the property holding citizens were in the ascendant whether they had a worldly or ecclesiastical lord or made their own laws, as was the case in the numerous free imperial towns of Germany. In the modern town the element which owns nothing is the greatest. It forms the most important support for productive labour in the main. This predominance of the propertyless element has brought with it an entire change, not only in the requirements of dwellings, but also in the whole character of the towns. In the economic small industry which five decades ago was predominant in Germany, and which in small towns is still important, the dwellings, the workshop, and also the shop were so combined that the workman in most cases not only worked at his trade in his master's house, but also lived there and belonged in a certain sense to the family.

When in the course of the development of factory work the small industry was forced aside, a separation of the dwelling and the workshop naturally took place. The latter was removed from the existing residence. The immediate demolition of the old does not indicate the beginning of the contrast between the new and the old, but an increasing settlement of new elements on the periphery. The results of this crystallisation caused little by little breaks in the old conditions. The result of this transfer of the workshops was the building of large quarters that are occupied exclusively by the working population. How these workmen's quarters developed in the beginning it is not necessary for me to describe more particularly. Before their existence the expression "overcrowding" was unknown. This word alone indicates the lowest point in civilisation of a whole period which is to-day not yet ended. The recognition that the compliance with hygienic requirements in regard to dwellings for the working population forms the foundation for national power has not yet been understood everywhere, and not by everybody even in the higher classes. Where the vigour of the people has been undermined by bad dwellings, national power must become also reduced. I will not pay you a compliment, ladies and gentlemen, but one thing is certain, and that is that England in this respect is not only the most advanced of all civilised countries, but that you, without town planning laws, were the first to recognise the importance of the whole subject and to undertake the remedy of the evil. In England the "industrial revolution" took place much sooner than in continental countries.

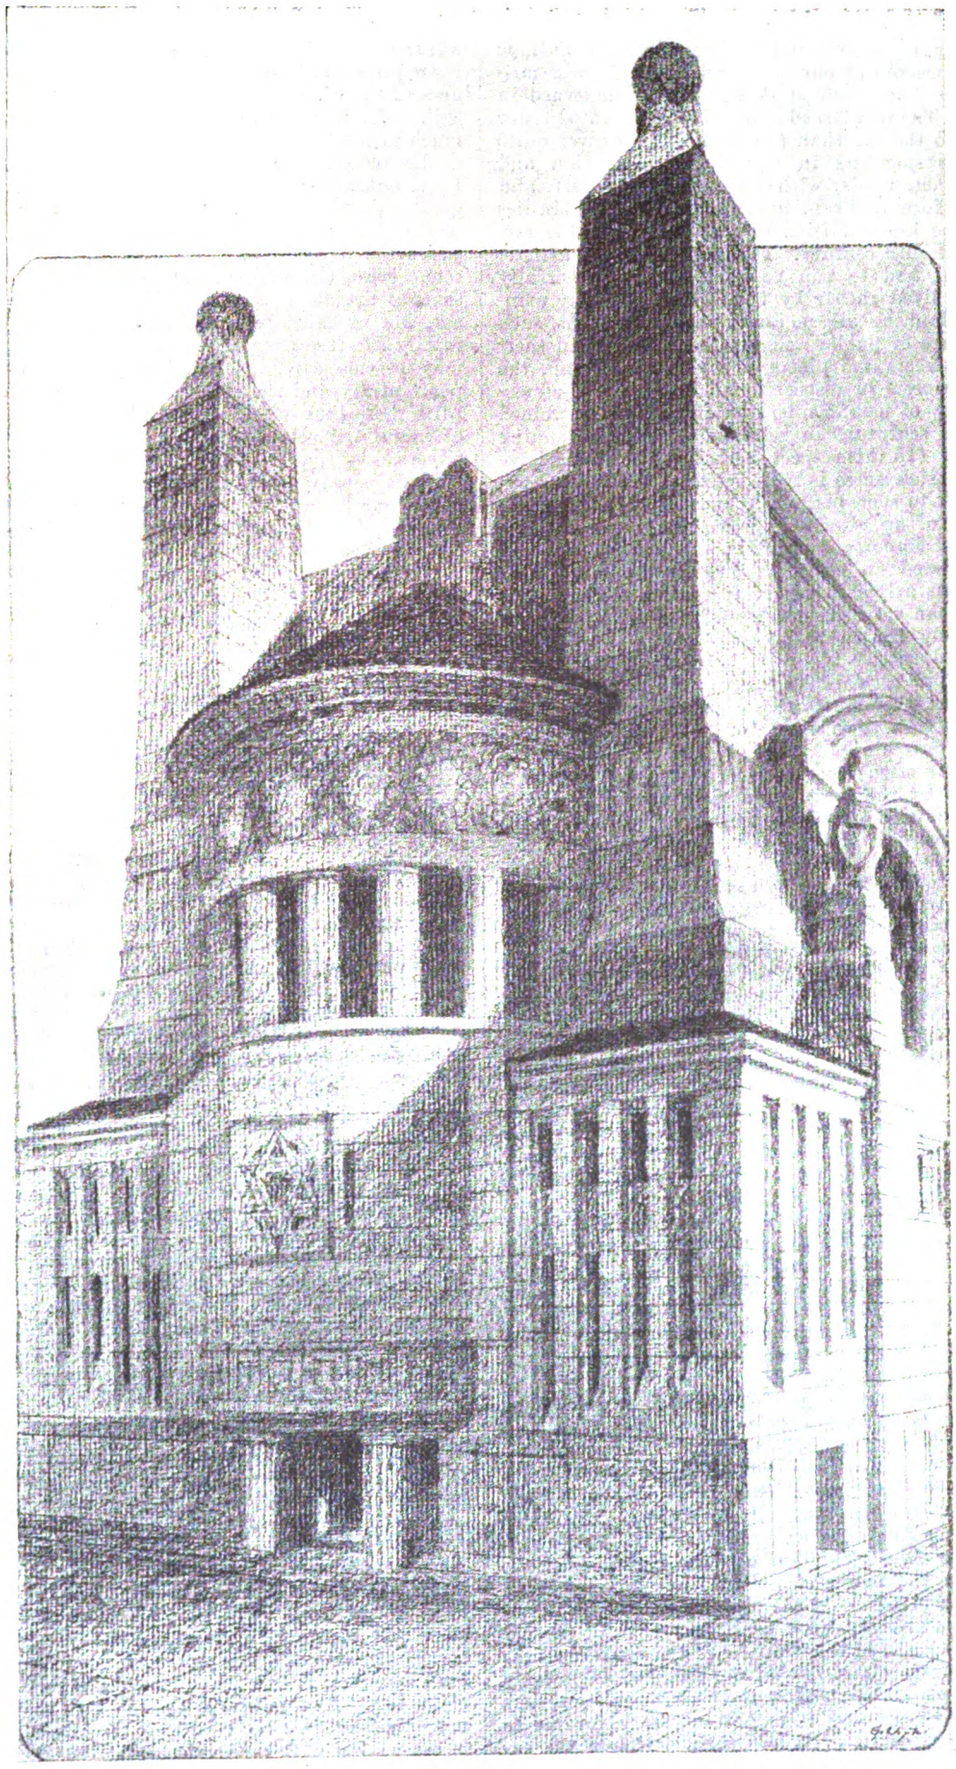
Let me now state clearly the view that town planning and town enlargement should, in the first place, provide the greater part of the population with good, cheap, healthy and modest artistic dwellings. Government institutions should endeavour to secure to the man who, in proportion to his income, bears the greatest burden of the State, not only insurance against illness, invalidity and the infirmity of old age, but in his days of health above all the certainty of a family life free from defect, the assurance that his children may become capable citizens and not candidates for the penitentiary and the gallows. Dwellings fit for men accomplish more than whole books full of moral laws, or an army of moral inspectors who live from the money of the taxpayers.

This is only possible when the State and the community endeavour to acquire as much land as possible, not for the purpose of selling again, as an object of commerce, but for the purpose of the public weal. The town must be able to be the master of its own development. The direction must not be determined by private interest, as has been the case till now, but by the interest of the community. Permit me to demonstrate this by two examples.

Example 1.—*Berlin.*

It is intended to combine Berlin and its numerous suburbs which already comprise a population of several millions. Apart from the difficulty of securing the proper administration of such a great town, it must be pointed out that the vacant building land at the centre will, under the present system of development, soon be covered with blocks of dwellings, and thereafter developments can only be made on the periphery. Land speculators have, however, acquired all the land purchasable for a great distance, and before long these speculators will be able to secure prices ten, twenty, and even fifty times greater than those paid for the land. Unless measures are taken to make the building of cheap small dwellings possible, independent of the manipulation of the speculators, there will be a further deterioration in the homes of the working classes. Until now action to secure this end has not been taken. Schools, hospitals, scientific institutes, open squares and recreation grounds were at no time provided by speculators, therefore the community will be compelled to acquire the ground in the future for a high price, that is, in other words, to raise the rates permanently. Moreover, for all these lands which around Berlin are still meadows, fields and woods, town plans approved for building block dwellings exist already. The carrying out of a really great, uniform, well matured plan is only to be thought of with an enormous sacrifice of the ratepayers.

The solving of the housing question for the 90 per cent. of the propertyless citizens of Berlin has so far not been earnestly thought of. Its proper solution would appear, in view of the prevailing land values, to be absolutely impossible. Whether in this case as in so many others, the future will sit in judgment on the faults of the past and pay the heavy cost, only time will show.



Example 2.—*Ulm.*

The second example does not refer to a great metropolis like Berlin, but to a town rich in historical past and historical monuments. This town, Ulm, was until recent years deprived of free development by the existence of a belt of fortifications. With the development of the science of modern fortification it has been possible to remove this interior fortification belt and thus render possible the enlargement of the town. The land on which these fortifications stood was acquired by the municipality. The town council became the master of the situation, not only in regard to the land acquired, but in regard to all the land on the outside of the belt. By this wise action the town council of Ulm has not only increased the wealth of the city by many millions of marks, but with rare civic wisdom has definitely used the possession of this land in the interests of the common weal by planning cheap sites for workmen's dwellings, not as in other cases in Germany, dwellings of the densely populated barrack type, but houses for two or three families. RESIDENCE AT BUDA-PEST.—FRANZ MATOUSCHEK, Architect.

recently an improvement has been made upon this. Ulm is now building houses with gardens for one family, and has thus demonstrated that the provision of one-family homes, which is almost unknown in large German industrial cities, is possible if the proper steps are taken at the right time.

The Proper Development of Suburbs.

Under the conditions of development prevailing in most German towns to-day, everything is being done to maintain the supremacy of the centre. The building of educational, scientific, and artistic institutions is practically restricted to the centre. Centralisation has been the motto. As a result very great mistakes have been made. Nothing can be more perverted than the consequential carrying out of this principle in all departments of public life. Why should new settlements not have as good schools, as beautiful churches, libraries and museums as the centre?

What, then, are the principles to be followed in order to secure the right development of new suburbs? The foundations of a rational solution of this problem are to be found only when the following principles are borne in mind:—

(*a*) The restriction of the number of houses or rooms to be placed upon the land. In this way a most valuable restriction can be placed in regard to the density of population.

(*b*) The consideration of aspect in order that the maximum amount of sunshine may be secured for houses.

(*c*) Consideration of the prevailing winds in order that proper ventilation may be secured.

(*d*) Consideration of existing main roads.

(*e*) Careful provision of spaces for public buildings.

Nothing of real value can be done in town extension unless places are provided for public buildings from the beginning. This provision of sites for public buildings must be made as for a future town and independent of existing centres. In this respect the Hampstead Suburb gives a most valuable example.

New Conditions of Town Life.

In modern towns completely new conditions govern the developments, industrial and otherwise. The necessity for concentrating wholesale commerce and manufacture and for providing the necessary traffic facilities for this concentration is one great factor. It is equally necessary that the homes in which the workmen live should be removed from the bad, smoke-laden air of the industrial quarters.

These two factors alone render necessary two types of district planning, and render it imperative that in the town planning of our day we must face more and more clearly the question as to what purpose has to be served in the main in the laying out of new settlements. We must, moreover, realise that the interests of commercial intercourse render necessary a kind of planning quite unlike that for housing purposes. The proper methods of planning the industrial quarters of a city should rest on the geometrical proposition that the shortest distance between two points is a straight line. In these industrial quarters the quickest expedition of persons and things is most desirable.

The question which must decide the conditions of planning land for housing purposes is a completely different one. The cardinal considerations in this matter are considerations of physical and mental health. One thing must be clearly realised, viz. that the combination of commercial and dwelling districts such as existed in the ancient time is now impossible.

The Need for Simplicity in Development.

Finally, I may point out that we need more beauty in the development of our towns. Engineers realise that a machine must be relieved from every superfluous decorative weight and have only a bare beauty of purpose. In a similar way to secure that free human activity may reach its highest development consideration must be given to simple beauty of

Digitized by Google

purpose. This is especially true in regard to the building of houses and the planning of land. We have gradually been satiated with conventionally architectural grandeur, and it begins to be tiresome. In the simplification of life are to be found from the beginning to the end all conceptions of beauty. In the vast labyrinth of industrial life we have lost Ariadne's thread, the measure of natural sympathy. In regard to architecture the old examples of town architecture can teach us proper methods and show us how a better fashion, a fashion corresponding to the spirit of our time, is to be formed. I have purposely avoided detailed criticism relating to town planning—social, hygienic, and artistic. In the time at my disposal it has only been possible for me to deal with general principles. It is true that some principles are of universal application, as, for example, the principles of hygiene. In studying the development of our towns, let us study these principles, understand clearly the reasons for the developments we advocate, and combat everything that is unreasonable, in contradiction to the nature of these developments. We cannot do better than recognise the truth of Jean-Jacques Rousseau's words, "Retournons à la nature" (Let us return to nature). Let us follow the nature of the circumstances under which our towns must develop and not act against those unwritten laws whose ultimate purpose is the ennobling of human life. Let us remember that town planning has always been a mark of culture, and that this is more than ever so to-day.

OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* contains an excellent article on "Indirect Lighting" as applied to electric light, in which the merits and defects of this method are discussed. The illustrations comprise a full series from the New Theatre in Central Park West, New York, of which Messrs. Carrere & Hastings are the architects, and some further examples of the work of students of the Society of Beaux-Arts Architects.

La Construction Moderne illustrates several examples of workmen's dwellings erected for the employés of Krupp's factories.

Deutsche Bauzeitung gives further illustrations of the Baden Grand Ducal Government buildings at Karlsruhe. There is an article on the proposed street improvement of the Dresdener Strasse in Berlin, as object-lessons for which our contemporary gives illustrations of the Molière fountain at the corner of the Rue Richelieu and Rue Molière, and of the Fontaine Saint-Michel in Paris.

Architekten und Baumeister Zeitung illustrates yet another of the blocks of flats in the Neulinggasse of Vienna by Rudolf Erdös.

Arkitektur og Dekorativ Kunst reviews and illustrates the premiated designs in a competition for workmen's cottages in two classes, the one built of wood, the other with solid walls of brick or stone.

Het Huis continues its account of the picturesque town of Zaandijk, in North Holland, which fills the whole number.

The *Engineering Record* contains rather an interesting account of how a contractor's plant is arranged and worked in the erection of a high reinforced-concrete building, the example described being that at the construction of the Surety Building, Muskogee, Okla., a corner building eight storeys high, measuring 50 feet by 115 feet on plan. A description is also given of the method of recording photographically the setting of cement by the use of the apparatus invented by Martens, of the Royal Testing Laboratory in Gross-Lichterfelde, Germany.

COMPETITIONS.

Tralee.—In this competition for a Carnegie free library and technical schools at Tralee, Ireland, the first premium of 20*l.* has been awarded to Mr. J. Clarke, architect, Liverpool, while the other premium of 10*l.* goes to Messrs. Webb & O'Callaghan, Dublin. Mr. G. C. Ashlin, R.H.A., acted as assessor for the twenty-three designs submitted.

Wood Green.—In a competition limited to fifteen selected architects, for public baths for the Wood Green (Middlesex) District Council, the first premium of fifty guineas has been awarded to Mr. Harold Burgess, the second of twenty-five guineas to Mr. E. Harding Payne, and the third of fifteen guineas to Messrs. F. J. & F. D. Smith.

Correspondence.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

R.I.B.A. Conditions for Building Contracts.

SIR,—A misprint has been discovered in Clause 30 of the Revised Form of Agreement and Schedule of Conditions for Building Contracts which has been issued from the Royal Institute since October 14, 1909. If all those who have purchased copies of the Form since that date will kindly return them to me, I will at once send them corrected copies. IAN MACALISTER, Secretary, R.I.B.A.

December 28, 1909.

Precautions Against Fire.

SIR,—The serious fire at Clapham Junction, resulting in loss of life, has again drawn the attention of the public to the very real danger incurred by the use of large quantities of inflammable material for window displays, bazaars, &c.

That easily ignited material cotton wool could, and should, be entirely replaced by asbestos wool, which is now produced to equal cotton wool in effect, whilst being absolutely non-inflammable.

Again, all woodwork and drapery should be either impregnated with solution or coated with fireproof paint.

The lessons to be learnt from the fire at the Paris bazaar appear to have been forgotten, although the calamity itself is still remembered as an event, and it would appear to be absolutely necessary that the authorities should issue more stringent instructions and supervise the arrangements made for these displays, bringing them into line with theatres, music-halls and other places of public resort.—I am, sir, yours truly,

December 23, 1909. FIRE PREVENTION.

GENERAL.

The Arbroath Town Council have received an offer from His Majesty's Office of Works to take over the Abbot's House in connection with the Abbey ruins and keep it in a state of preservation. Hitherto the Town Council have received a considerable rental for the Abbot's House, which has been long occupied by an Arbroath family. The Council have remitted to the property committee to consider what should be done in the matter, and whether a sum of money should not be asked from the Office of Works before parting with the building.

The London County Council on November 16 decided that tenders should be invited from selected firms for taking out quantities for the first section of the new county hall, and that tenderers should compete on a time basis for the completion of the work. The establishment committee now ask that they be authorised, on behalf of the Council, to deal during the Christmas recess with the tenders received.

Lancaster's new town hall, presented to the borough by Lord Ashton, was opened by his lordship on Monday last, when a gold key was presented by Mr. F. Dare Clapham, who has superintended the works since the death of his partner, Mr. E. W. Mountford.

Mr. W. T. Oldrieve, H.M. Office of Works, has intimated to the Corporation of Edinburgh that he has been instructed by the Board of Works to state that they are very willing to do what is in their power to prevent the destruction of the old city wall at the Royal Scottish Museum in Edinburgh.

Messrs. Bruce & Hay, architects, have been appointed architects for a new school about to be erected by the Bothwell School Board, N.B.

The Margate Town Council by a majority of two have approved a scheme for improving the front, by dealing with the unfinished kursaal, at an estimated cost of 46,000*l.*

The Dean of Winchester has received a donation of 300 guineas to the Winchester Cathedral Preservation Fund from the Mercers' Company, in addition to their previous gifts of 250*l.* and 1,000*l.*

Messrs. Heeley & Peart, of Birmingham, recently submitted plans to the Newport Town Council, which were passed last week, for new works to be erected on the Somerton estate on the east side of the town. The works will be for the manufacture of light iron goods, and will commence with about 200 hands.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

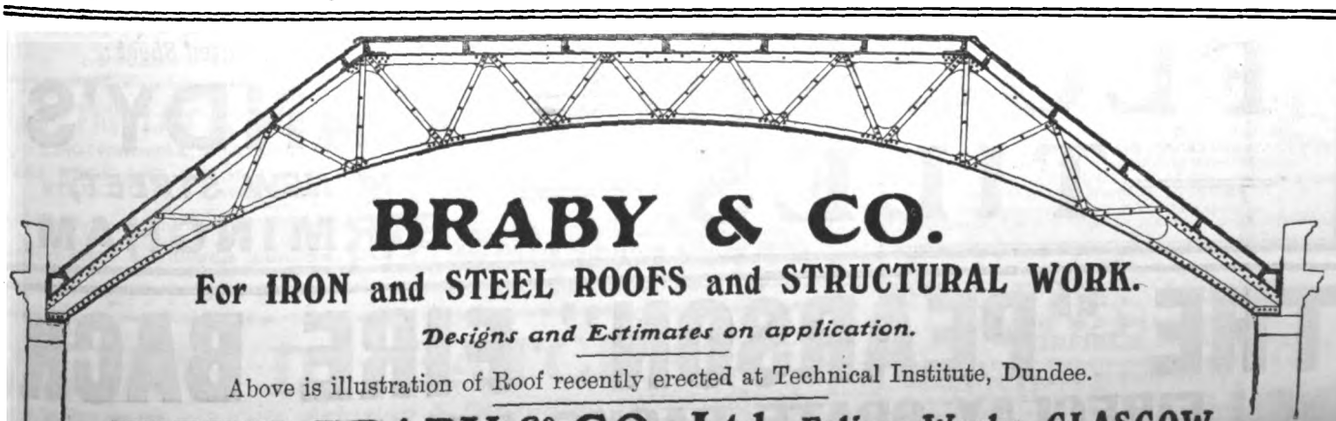
Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.



BURSLEM.—July 17.—For new public buildings. The author of the design placed first by the assessor will carry out the work. The architects placed second and third will receive premiums of 100*l.* and 50*l.* respectively. Deposit 2*l.* 2*s.* Mr. F. Bettany, borough surveyor, Burslem.

DEPTFORD.—Sept. 1.—The Metropolitan Borough Council of Deptford invite designs for a branch library at New Cross, S.E. Premiums of 50 guineas, 25 guineas and 10 guineas will be awarded. Assessor, Mr. J. S. Gibson, V.P.R.I.B.A. Deposit 1*l.* 1*s.* Competition is limited to architects practising in the city or county of London. Mr. Vivian Orchard, Town Clerk, Town Hall, New Cross Road, S.E.

GLASGOW.—July 31.—The patrons of the Royal Incorporation of Hutchesons' Hospital invite designs for laying out for feuing and building about 195 acres of their lands of Thornliebank, Eastwood. Premiums of 100*l.*, 75*l.*, 50*l.* and 25*l.* will be awarded. Deposit 3*l.* 3*s.* Messrs. Hill & Hoggan, 194 Ingram Street, Glasgow.

GRIMSBY.—July 30.—For the extension of the town hall, at an estimated cost of 26,000*l.* Premiums of 250*l.*, 150*l.* and 100*l.* will be awarded. An eminent architect will act as assessor in conjunction with the borough engineer. Deposit 2*l.* Apply to Mr. H. Gilbert Whyatt, A.M.I.C.E., borough engineer, Town Hall, Grimsby.

READING.—July 31.—The Berkshire County Council invite designs for offices, committee rooms, &c., on the Forbury, Reading. Mr. Mervyn Macartney, F.R.I.B.A., assessor. Premiums of 100*l.*, 75*l.*, and 50*l.* Deposit 1*l.* 1*s.* Apply to Mr. J. Fred Hawkins, county surveyor, Bank Chambers, Cross Street, Reading.

BRABY & CO.

WOOLER.—July 10.—For alterations and additions to Wooler C.E. school premises, Northumberland. Mr. M. Temple Wilson, M.R.S.I., architect and surveyor, Alnwick.

THE Old Bath preservation committee have issued the first two pamphlets of a proposed series which will deal with Bath, its architecture, historical associations and objects of interest. The Association contemplate "(*a*) Aiding the citizens to maintain their valuable architectural heritage; (*b*) directing attention to places and objects worthy to be preserved; (*c*) fostering a feeling of pride in the historical, literary and artistic associations that cling around the city." Pamphlet No. 1 recounts the history of the movement for the defence of Bath Street with its colonnades against the threatened demolition. Pamphlet No. 2 is described as "The Official Statement of the Bath Corporation examined, criticised and refuted in every important particular."

AN experiment which may lead to the adoption of electric light in the centre of Birmingham is to be conducted by the Electric Supply Department of the Corporation. There are to be placed in Corporation Street four electric arc lamps of a new type, and if, after experiments, the public works committee decide that they are a more effective means of lighting than the present incandescent lamps, a proposal may eventuate of an extended system of electric lighting.

TRADE NOTES.

MESSRS. THOMAS LAWRENCE & SONS, Bracknell, Berks, supplied the whole of the red facing bricks for both the inside and the outside of the memorial chapel at Millbank Hospital, which was opened by the King on June 23. Messrs. T. Lawrence & Sons have, moreover, supplied the whole of the best red facings for the other buildings erected at Millbank during the past few years.

THE proprietors of the *Furniture Record*, 14 City Road, E.C., have chartered the Clyde Shipping Company's steamer *Lizard* for the Naval Review on Tuesday, July 20. The tickets are 25*s.* each, inclusive of luncheon, tea, and rail, and the boat will start from Gallions Wharf, and a special train will convey the party from Liverpool Street to the wharf.

THE visitors to the Victoria and Albert Museum who become enamoured of the new interior arrangements are probably unconscious of the part played by the wall surface. This, however, is a very considerable one, and reflects great credit on the firms concerned who have produced such satisfactory colour effects. In the Tapestry Court, for example, the subdued green and ivory water paint is particularly successful; and this, despite the fact that the Rapidal Paint Company found the surface of a specially difficult nature. The firm have large experience in work of this kind for the same Rapidal Water Paint has been employed by the Office of Works on the Royal College of Science, the House of Commons, the Royal Mint, the G.P.O., &c.

THE Waring White Building Company, Ltd., have, we understand, received the contract for erecting the superstructure of the Birmingham Council House extension (architects, Messrs. H. V. Ashley & Winton Newman); and also for the new premises of the Automobile Club in Pall Mall (architects, Messrs. Mewès & Davis and Mr. E. Keynes Purchase).

THE Council of the Royal Sanitary Institute have appointed Mr. Henry Adams, M.Inst.C.E., F.S.I., &c., to represent the Institute at the conference which is being organised by the Engineering Standards Committee to consider the desirability of a standard being adopted for stoneware, fireclay and other similar pipes.

BUILDING AND BUILDERS.

THE Tunbridge Wells Education Committee, in conjunction with the Kent Education Committee, propose to build at Combley Park a school for higher education at a cost of 10,000*l.*, to accommodate 200 girls.

THE Southampton Town Council have adopted plans prepared by the borough engineer for enlarging the refuse destructor at the wharf, by the provision of four additional cells and a steam boiler, at an estimated cost of 2,250*l.*

CARDIFF Technical Schools Committee have recommended to the Education Committee the desirability of providing an entirely new technical institute at an estimated cost of 40,000*l.*

AT Glasgow Trades' Council last week a deputation representing the building trade was appointed to wait upon the Corporation and lodge a complaint against delay in the completion of the new Mitchell Library. It was stated that many trades were idle because work was not being pushed forward as it ought to be. A report was submitted from the Parliamentary Bills Committee with reference to the House-Letting Bill. Among suggested amendments were that the Bill should apply to houses of 26*l.* and under, instead of 15*l.* as proposed, and should include all Scotland; also that lets should be limited to one month at the outset.

MR. BERTIE CREWE, architect, of 75-77 Shaftesbury Avenue, London, W., on behalf of Mr. Charles Boyle, of 48 Abingdon Villas, Kensington, London, W., is about to apply for authority to erect a theatre upon the piece of land with frontages to Shaftesbury Avenue, Broad Street, and Grape Street, in the Borough of Holborn.

THE National Association of Master House Painters and Decorators of England and Wales, of which Mr. James Puttrell, of Sheffield, is president this year, will hold their annual convention in Sheffield in September. The meetings commence on Monday, September 13. On the Tuesday morning Sir William Richmond, R.A., K.C.B., will formally open the exhibition at noon. Sir William has also promised to deliver a lecture in the evening on "Some Phases of Decorative Art."

VARIETIES.

THE Westminster City Council have deferred the proposal to repave Belgrave Square, at a cost of 11,345*l.*, till the next meeting, for the views of the rated occupiers to be ascertained as to whether wood or macadam should be used. It was stated that Belgrave Square is the largest in London, and its rateable value is higher than any other. The repaving of Carey Street is also to be deferred, in order not to interfere with the work of the Law Courts.

MR. P. C. COWAN, Chief Engineering Inspector of the Local Government Board, opened last week an inquiry touching the application of the Dublin Corporation for the Local Government Board's sanction of the following loans:—100,705*l.* for the purpose of extending the electric lighting mains and plant, 100,000*l.* for completing the main drainage system, 17,400*l.* for erecting working-class lodging-houses on a site at Inchicore, under the Housing of the Working Classes Acts; 10,632*l.* for completion of refuse destructor, &c.; 10,000*l.* for advances under the Small Dwellings Acquisition Act, 1899; 10,000*l.* for carrying out street-improvement works; 1,320*l.* for lighting Drumcondra and N.C.R. by electricity; and 1,006*l.* for private improvements expenses.

FOR the convenience of travellers to Belgium by the Harwich route the Great Eastern Railway Company have just placed on the Antwerp express train from Liverpool Street Station dining and breakfast cars, in which table d'hôte dinner and other refreshments are served on the down journey and table d'hôte breakfast on the up journey. In connection with the Aeronautical Exhibition to be held at Frankfort-on-Main, July 10 to October 10, through carriages will be run between the Hook of Holland and Frankfort.

SUBJECT to the Board of Trade reviving the order for the making of the line, the Middlesex County Council has agreed to proceed as soon as possible with the construction of the light railway from Ponder's End to Enfield Town, and has accepted a tender of Messrs. Dick, Kerr & Co. at an estimated cost of 45,500*l.* for the work.

AT the last meeting of the executive committee of the Swansea Harbour Trust it was agreed to build premises for the Customs at the King's Dock. Tenders were received for the electrical plant of the King's Dock, and orders for

portions of the plant were placed, but with regard to the major part it was decided that a sub-committee should report. It is estimated that the plant would cost nearly 20,000*l.*

THE WATKIN SWITCH.

THE patent Watkin switch must have been born to greatness, for in a matter of months it has attained a reputation that most inventions take years to win. This switch and electric light controller, it should here be mentioned, is a device whereby electric light is regulated to the same extent as gas. But what is especially remarkable is not so much the number of users at home and abroad as their quality; that is to say, the unusual proportion of experts who have seen fit to adopt it. It is used by many Government departments, including the Office of Works in London, Dublin and Bombay; the National Physical Laboratory; at the Prime Minister's official residence; by the Admiralty; the Governments for India and New Zealand; in asylums at Long Grove, Stone, and Croydon; in the Middlesex, Swansea, and London hospitals; by the Corporations of Leith, Marylebone, Wrexham, Dundee, Ealing, Pontypridd, Leyton, Ilford, West Ham, and Merthyr; and lastly such firms as Edison & Swan, Ltd., Drake & Gorham, Simplex Conduits, Coates & Son, Veritys, Ltd., Witty & Wyatt, Electrical and General Engineering Company, Trollope & Son and Colls & Sons, Ltd., Waring & Gillow, Whiteleys, J. Lyons & Co., and others.

The switch resembles a tumbler type in outward form fitted with a number of frames, each charged with a special composition. The dolly of the switch is connected with the rocking lever, which carries at the inner end spring pistons travelling over contacts connected through a box with the frames. The switch has seven steps enabling the user to obtain a corresponding number of degrees of illumination when the apparatus is connected in series with a lamp, or for producing seven degrees of power in regulating a fan. It will control any number of lamps with a maximum of 600 watts, or about 550 c.p. metallic filament lamps. The light can be reduced to a mere glimmer if necessary, and the cost saved accordingly. It is equally applicable to electric fans, heaters, motors, or any other use of current. The Watkin switch can be used either in series with the ordinary switch or in place of it, and is very neat and compact (being only 4½ inches by 6½ inches), while the internal construction is excellent. It is claimed that when this device is used electric light becomes as cheap and as easily regulated as gas, or the cost of running a fan can be reduced to a minimum. This claim is well substantiated by scientific tests.

At a demonstration given in March last before the Royal Institution the current for a bank of metallic filament lamps was reduced no less than 6 per cent. of the maximum. It is most important to note that this is effected without any alterations of fittings or wiring. The switch connects up with the existing switch or takes its place. The expense is therefore limited to the cost of the switch. The cheapest is 17*s.* 6*d.*; this will control 70 watts, and has three variations of energy. To control from 450 to 600 watts the price is 35*s.*, and this has seven variations.

The Watkin switch succeeds in doing for electric light just the one thing that has been wanting. The consumer will no longer be under necessity to have all the light or none at all from a single lamp or a series. The ability to raise or lower gas exactly to the degree desired, has always been one of its chief advantages, for there are numberless occasions in which it is preferable to have a faint light than to have total darkness. The new invention enables the electric light user, whether on a large or small scale, to do this every bit as satisfactorily to his great personal comfort and financial gain. The patentees and manufacturers are Messrs. Adams & Co., 109 Victoria Street, London, S.W.

THE ASSOCIATION OF WATER ENGINEERS.

THE fourteenth annual general meeting of this association was held in Durham last week. At the opening meeting Mr. Robert Askwith, M.I.C.E., engineer to the Weardale and Consett Water Company, gave his address as the new president. In his opening remarks he stated that in membership steady progress is being made, as is shown by the following figures:—Honorary members 3, members 207, associate members 116, associates 39, total 365. As on former occasions, the increase is chiefly under the heading of associate

members. The offer made by the retiring president of a 10*l.* premium for a paper entailing research work, and the decision lately come to by the Council to award two premiums of 5*l.* each for papers selected by them, will, it is believed, produce valuable contributions to the "Transactions."

It would prove very useful to members if a table were prepared showing what figure ought to be generally accepted as a reasonable maximum consumption of water per head per day for domestic purposes by communities which are supplied under different circumstances and where constant supply is given. It is difficult to understand why the rate of domestic consumption should vary from ten to forty gallons per head per day or more in different districts. There are, of course, reasons for some differences, as, for example, where the public supply of water is hard it is often supplemented by the use of soft rain water for washing purposes; and the consumption of the public supply is in such cases lower than when this is soft and suitable for all purposes. The number of baths and water-closets relative to the population supplied must also have a great effect on the consumption; but these and other such local differences do not fully account for the great variation that exists. If, however, in the cases where the consumption is relatively high, the difference is caused by waste, the matter is worthy of our most careful consideration. If we assume that 30,000,000 people in these isles take their water supply from public undertakings, and the waste is only a gallon per head per day, the value of the water wasted when worked out at the very low price of 6*d.* per 1,000 gallons amounts to more than a quarter of a million pounds sterling each year. The question of prevention of waste is thus seen to be one of great importance from a monetary point of view; but when we remember that the supply of pure water in this country is limited, and that the various sources are being rapidly appropriated, it becomes a question of vital national importance.

The two most important considerations to be borne in mind in endeavouring to minimise the waste of water are, firstly, to see that only the best quality of water-fittings and the highest class of plumbing work are employed in connection with water undertakings, and secondly, the adoption of an efficient system by which repairs (which in time become necessary, however good the fittings may originally have been) are carried out without loss of time. Mr. Askwith strongly recommended members to take full advantage of the work of the incorporated committee, and to submit all new fittings to a careful examination in regard to the nature of the metal used, the design and the workmanship of the various parts. It is hoped, said the President, that the time is not far distant when incompetent plumbers will not be allowed to carry out any work in connexion with water distribution, and that by the elimination of incompetency in the plumbing trade much preventable waste of water may thereby be checked. As regards the second point, namely, the prompt repair of fittings found to be defective, much remains to be done. The system adopted by the Weardale and Consett Water Company of insurance of fittings has been very effective in securing the prompt repair of defects. The company contract to repair and renew, as necessity arises, all pipes and taps for a payment of 1*s.* per year for each draw-off tap. This system was established more than thirty years ago, and has steadily grown in favour until the company has now upwards of 44,000 taps under their care. Any reports of waste received either direct from the consumers or through the company's inspectors are promptly attended to. By this system the waste of water has been reduced to a minimum; and the consumption last year averaged only nine and a half gallons per head per day for the domestic supply of a population of 360,000. This includes all water consumed by builders and for gardens, cattle, small trades, and washing out service tanks and flushing pipes—meter supplies alone being excluded from the figure quoted.

Before leaving this subject it may be interesting to show the monetary importance of preventing waste by quoting some figures in connection with the Newcastle and Gateshead Water Company. Owing to the increase of population in this company's district during the nine years from 1900 to 1908 inclusive, more than 22,000 extra houses, containing a population of about 110,000 people, and having nearly 17,000 water closets and 9,000 baths, were connected to the company's mains; the additional income from this source amounting to upwards of 20,000*l.* per annum. In spite of this extension of the supply, the total consumption of water for domestic purposes was less in 1908 than in 1900.

THE INSTITUTION OF GAS ENGINEERS.

THE annual meeting of the above Institution was held in London from June 15 to June 17. At the opening meeting Mr. Thomas Glover, of Norwich, delivered his presidential address. After dealing with topics of special interest to the members, Mr. Glover spoke in the following manner upon the provision of smokeless fuel:—

In the past, as in the present, the chief service of the Institution has been to provide light, and we hope that this may be so for many years to come. The importance of that part of our business and work must not be underestimated; but is it not apparent that in the future we shall be called upon to take no mean part in providing smokeless fuel both gaseous and solid?

The movement for the abolition of the smoke nuisance, as it is called, is gathering strength; and the part the domestic chimney plays in creating the nuisance has now begun to be recognised. It is unbelievable that the inhabitants of our large towns and cities will go on for ever using rich bituminous coal in such a way as to heavily charge the atmosphere they have to breathe with the products of distillation. I do not hesitate to say that it would be a blessing to our people from a sanitary point of view, which might come to be appreciated, if a courageous Chancellor of the Exchequer, casting round for a new basis of taxation, were to seize upon bituminous coal, and so tax all consumers of it (except gas undertakings) as to compel a preference for smokeless fuel. A too plentiful supply of the mineral has resulted in its use by methods truly described as "barbaric," both for manufacturing and domestic purposes. Manufacturers are rapidly reforming and finding that complete combustion pays. The domestic fireplace is a more difficult question.

Taking London as the greatest city and the one most plagued with smoke fogs, we find that it is estimated that there are nearly half a million gas cooking-stoves in use; but the relief to the smoke-charged atmosphere by their use on a late autumn or winter morning is unappreciable because of the millions of apartments which must be warmed by having fires lighted by unscientific hands, in cold grates, and by the use of bituminous coal. Look from a hotel window, or from an elevated railway over London, and gauge the extent of the problem. It will be obvious that, when public opinion has become educated sufficiently and the remedy is at hand, the demand for a smokeless fuel must be enormous. What is true of London is true also of the provincial cities and towns.

The city of Norwich is fondly called by its inhabitants the "City of Gardens." It is provided with numerous open-air spaces and has an abundance of trees and gardens. The factories obtain their power, for the most part, from gas engines and electric motors. In the 25,000 inhabited houses are fixed close on 20,000 cooking-stoves. Gas fires and other heating appliances are being fixed at about the rate of 800 to 1,000 per year. In the summer the city is comparatively free from smoke; but on an autumn or a winter morning the smoke may be met at a distance of three miles from the city boundary, and in the lower parts of the city the atmosphere would be so charged with the products of distillation as to be almost unbreathable.

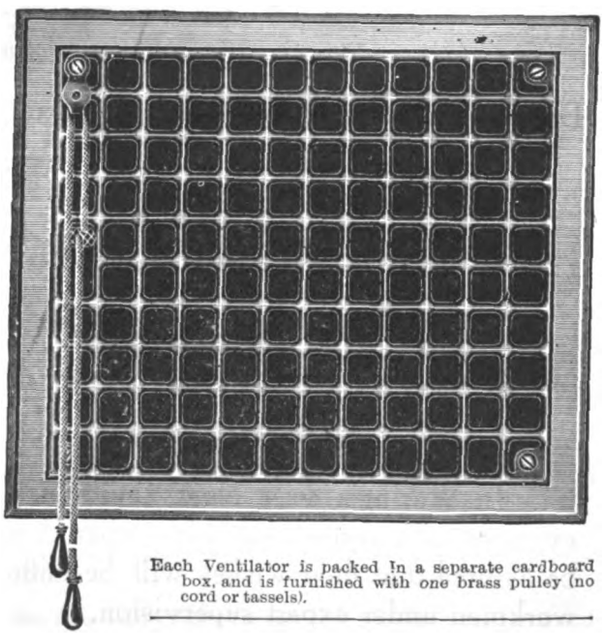
The loss of sunlight, the ill-effects on health, the damage to buildings, both ancient and modern, the dirt and squalor of our towns, constitute part only of the price the public have to pay for using fuel the wrong way. If a remedy is to be found, it will be through our gas undertakings, which already, by their enterprise, have done much more than has been given credit for by those who are taking a prominent part in the smoke abolition movement. Taking the estimated quantity of gas used for fuel purposes, together with the quantity of coke produced for sale, the gas undertakings of the United Kingdom are providing the public with smokeless fuel equal to about $7\frac{3}{4}$ million tons of coal per annum. By the help of an educated public opinion, the quantity of both kinds of fuel to be supplied from gasworks will be greatly increased.

From some interesting tables recently published by Mr. W. J. Carpenter, of Great Yarmouth, I find that the ratio of day consumption in that town to the total annual consumption in the year 1887 was 27.85 per cent., against 45.01 per cent. in 1907. For the summer months the increased ratio is still more striking:—

In June 1887 the ratio was 20.54 per cent., against 50.42 per cent. in 1907.

In July 1887 the ratio was 19.98 per cent., against 50.96 per cent. in 1907.

... THE ...



H. & C. Wrought Steel

"Louvre" Ventilators

Black Japanned,
White Japanned,
Nickel Plated,
Bronze Plated.
ALSO IN
Solid Wrought Brass
and Bronze Metal.

ELEGANCE. LOW PRICE. NO BREAKAGE.
SPECIFIED BY ARCHITECTS.

MADE IN 130 SIZES.
From 4 by 6 to 24 by 42.

Each Ventilator is packed in a separate cardboard box, and is furnished with one brass pulley (no cord or tassels).

These Ventilators being made entirely of **Wrought Steel,** breakage either in transportation, in stock or in use, is practically impossible.

They are light in weight, with a consequent **Saving in Carriage.**

The Operating Slide is made of very heavy gauge steel, and is especially **strong** to insure against breakage and guaranteeing a **free** and positive operation.

Each Ventilator is packed in a separate cardboard box, and is furnished with one brass Pulley (no cord or tassels).

Sold by all First-class Builders' Merchants.

WM. E. PECK & CO. (Inc.), 31 Bartholomew Close, London, E.C.

Digitized by Google

In August 1887 the ratio was 16.07 per cent., against 47.53 per cent. in 1907.

In September 1887 the ratio was 14.78 per cent., against 41.94 per cent. in 1907.

This is interesting evidence, from a seaside resort, of the growing use of gas for fuel purposes. As it may have been observed that an unusually high proportion of the gas consumers of Norwich are provided with cooking-stoves, and as everything is done to popularise the use of gas for lighting purposes, the ratios of day consumption to the total are of interest.

Monthly and Yearly Ratios of Day Consumption to Total Consumption.

—	1905	1906	1907	1908
Total gas sold and	473,204	499,846	528,490	542,866
Day ratios to same	49·9	49·5	49·9	50·8
January	50·2	51·4	52·4	53·2
February	47·6	47·8	48·1	48·4
March	42·3	43·7	41·9	45·5
April	45·1	44·6	45·36	46·5
May	50·4	51·7	50·82	52·7
June	55·1	54·6	55·4	54·9
July	55·7	55·3	55·3	55·2
August	52·1	50·3	51·1	51·9
September	45·8	46·4	47·1	46·9
October	45·5	43·4	46·9	47·5
November	51·1	50·4	51·2	51·8
December	52·7	52·5	53·5	54·6

We may safely assume from the above figures that, so far as Norwich is representative, only about 50 per cent. of the gas is used for producing light; and of this 50 per cent. only about 10 per cent. is now used in luminous flames. Hence the declining importance of the photometer for ascertaining the value of a gas to the average consumer.

The disparity in the illuminating power and calorific tests made on gas produced in vertical retorts also points to the necessity for a change in the authorised standards. The freedom from photometrical testing enjoyed by German gas undertakings has favoured the adoption of the vertical retort and chamber systems of carbonisation. The retention in this country of tests, the value of which is now rapidly becoming nil, will hinder developments in carbonising. We may therefore regard with satisfaction the acceptance by the Gaslight and Coke Company of a clause in their new Bill imposing a calorific test, and look forward with hope to the time when tests for illuminating power will be entirely superseded.

As to the limits imposed and accepted by the calorific test, it has since been stated that 125 calories per foot of gas would constitute a standard higher than can be maintained where the illuminating power is fourteen candles tested with a No. 2 "Metropolitan" burner, and where a mixture of coal gas and carburetted water gas is supplied. In most works, however, there will be no difficulty in complying with such a standard; and the freedom allowed by such a test would be welcomed by many gas engineers who are now obliged to comply with stringent illuminating power regulations.

Household Heating.—Although we may legitimately claim that the gas industry is adapting itself to the new service required of it, and is showing its faith in the future use of gas as a fuel by spending capital freely on appliances which consumers can either hire or acquire on easy terms, and although we believe that in so doing a substantial advance has been made in the solution of the smoke nuisance problem, few gas men are so sanguine as Sir Oliver Lodge, who, from a recent address delivered at Sheffield, appears to anticipate that the whole of the fuel requirements of a model town can be supplied through gas-mains.

For many purposes coke will remain the cheaper and the better fuel; but with coke the conditions have to be fitted to the fuel, and something more can be done in this direction than has been done in this country in the past. The Coalite Company's scheme, however, recognises that the suppression of the open fire-grate will be a slow process; and they therefore propose to fit the fuel to existing conditions retained with such tenacity by the British householder. Along these lines lies abundance of scope for the gas engineer of the present and the future.

Scagliola Marble

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

BY SPECIAL APPOINTMENT

TO HIS MAJESTY.

SPÉCIALITÉ for surrounding Iron or Brick Cores.

These being fixed in the ordinary course of construction the SCAGLIOLA can afterwards be fixed round WITHOUT SHOWING JOINT.

The Coalite Process.—It is claimed by the promoters of "Coalite" that it is a free-burning, smokeless fuel which will compete in the market, not with gas coke, but with high-class coal for use in open fire-grates. The coal for its manufacture is distilled in groups of iron tubes, tapering from 5¼ inches to 4½ inches, set vertically, at a temperature of 800° F. During distillation about 5,000 cubic feet of gas, 20 gallons of tar, and liquor equivalent to 15 lb. of sulphate are produced. The plant, erected on land adjoining the Plymouth Gas Company's works, appears to be a marvel of completeness for carrying on the process economically. The distilling vessels being so small and the temperature required for the process being so low, compared with our practice, the fuel used is said to be only about 6 per cent. of the weight of the "Coalite" produced, and the wear and tear on the settings is reduced to a minimum.

By distilling the coal at the temperature used, the gases evolved are not subject to secondary reactions, the sulphur contents in the purified gas is favourably affected, the thin tars, when distilled, give an unusually large proportion of light spirit (said to be valuable for internal combustion engines), heavy oils free from naphthalene, and pitch innocent of free carbon. In a comparison of manufacturing costs published in the *Times* the gas into the holder from the process is figured out at 4.66*d.* per 1,000 cubic feet. The gas is said to have a heating value of 750 B.Th.U., and to have an illuminating power of twenty candles.

The departure from our ordinary retorting practice is so revolutionary, and the methods of exploiting have been so bold, it is not to be wondered at if the claims have been received with a certain amount of scepticism. The working of the plant at Plymouth, however, puts the proposition on to a different footing; and it is evident that, as gasmakers no less than as smokeless fuel providers, we cannot afford to neglect an examination of its claims. It may be that the Coalite process will become an auxiliary to the older system, and that it is destined to extend the sphere of public usefulness rendered by gas undertakings.

The Competition of Electricity.—Before bringing this address to a conclusion, I should like to revert to the diagrams of hourly gas consumption. If they reveal an important demand for other purposes than that of producing light, they also show how much we run the risk of losing if every care is not taken to satisfy the requirements of consumers as to their lighting arrangements. Hitherto convenience and cleanliness have favoured electricity, while relative cheapness has weighed with the prudent in favour of gas. The metallic filament lamp has done something to reduce the costliness of electricity; but corresponding improvements have enabled us to supply a greatly improved light with better facilities for turning on and off, and at the same time stained ceilings and over-heated rooms are practically things of the past where well-made and properly adjusted inverted burners are used.

With a duty of 20 to 30 candles per foot of gas for ordinary pressure, and 60 candles upwards per foot for high pressure supply, the days of gas lighting are not yet over. But our competitors are vigorous and active, and their artistic fittings place our unattractive brackets and chandeliers, the heritage of a hundred years of gas lighting, at a great disadvantage. To satisfy the educated taste of consumers, is it not important that artistic fittings should be supplied on easy terms, and so give our new forms of gas lighting a real chance? In the same way I believe that all better-class slot installations should be made models and examples to be copied by others. In such an installation the supply will be governed at the meter; the piping of the house will be sound and good; and the fittings will be light and artistic in design. Inverted burners will be used in the best rooms; and, if possible, maintenance of the mantles and burners, under certain conditions, will be undertaken.

Our electrical competitors have led the way in devising new and ingenious methods of charging for the energy they supply, and have frequently the advantage where rigid methods of charging for gas are adhered to. To compete for outside shop lighting it has been found necessary to quote an inclusive annual charge for a given candle-power over a number of lighting hours. The annual charge includes the hire of lamps, maintenance, cleaning, lighting and extinguishing. The cost of the latter may be obviated by the use of an hourly meter to register the number of hours the lamps are in use. This class of lighting business is well worth cultivating, as it keeps the capabilities of gas lighting before the public.

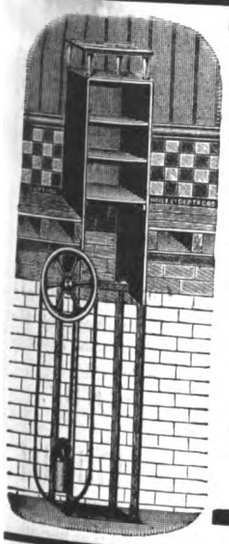
THE BUSH FIRE.



(Patent.)

Prices from 31s. upwards.

The Bush Fire is made in a variety of simple forms and lends itself to endless styles in decoration. It has all firebrick back and bottom. The bottom brick is surrounded by an iron grid, through which all dust falls into the ashpan, the latter being fitted with a ventilator, which controls combustion.

Lists AJ 16 of simple Mantels and Bush Fires on application.

WHERE to SPEND a QUIET HOLIDAY?
The Vale of Llangollen,
according to Ben Brierley, is "The Queen of Valleys," and *Our Own Country* describes it as "The Valley of Jewels, the Jewel of Valleys." Not only is its scenery lovely, but its mountain air is bracing and most salubrious.
Intending Visitors should secure Comfortable Apartments by advertising in the
"Llangollen Advertiser"
and North Wales Journal.

GILBERT WOOD & CO. LTD. 6-11 IMPERIAL BUILDINGS, LUDGATE CIRCUS, E.C

For 50 years we have specialised in the construction of Glasshouses, and our name is now regarded all over the country as synonymous with all that is latest and best in Glasshouse construction. Contracts are undertaken for the erection and heating of

CONSERVATORIES, WINTER-GARDENS, VINERIES,

and all kinds of Glasshouses. The most recent improvements in Ventilation, Heating, and internal fittings are introduced.

Plans and estimates will be sent free on receipt of particulars. Special attention is paid to carrying out the designs of Architects with care and accuracy. Write for Illustrated Catalogue, post free.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BURSLEM.—July 17.—For new public buildings. The author of the design placed first by the assessor will carry out the work. The architects placed second and third will receive premiums of 100*l.* and 50*l.* respectively. Deposit 2*l.* 2*s.* Mr. F. Bettany, borough surveyor, Burslem.

DEPTFORD.—Sept. 1.—The Metropolitan Borough Council of Deptford invite designs for a branch library at New Cross, S.E. Premiums of 50 guineas, 25 guineas and 10 guineas will be awarded. "WATERIB" "BROSELEY" ROOFING TILES

(Patent No. 10343/1907.)

"LIGHTMOOR" BRAND.

"WATERIB" Tiles laid to a 4½-in. gauge.

Tiles Packed.

POINTS:—

A sound roof.
Less breakage in transit.
Can be laid to a larger gauge.
Saving in fixing.
No extra over ordinary tiles.

Sectional Elevation of Tiles to a 4½-in. gauge.

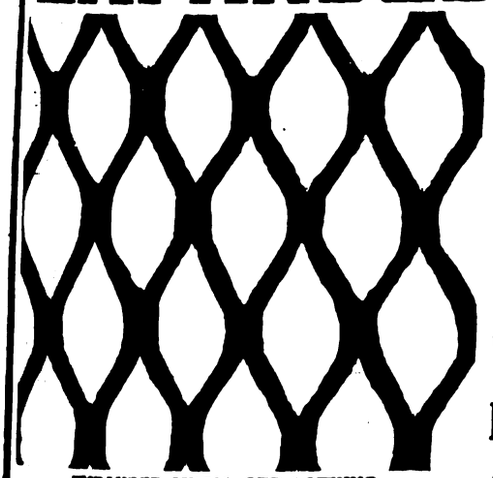
TRADE NOTES.

MESSRS. PECKETT & SONS, locomotive engineers, Bristol, owing to the large amount of work in the boilermaking department, are increasing the plant by the addition of two electric travelling cranes. Messrs. Peckett & Son have also recently added to the plant of the same department a 200-ton hydraulic flanging press.



MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied their patent Manchester grates to the Council schools, Swindon, and to the new cottage hospital at Tullow. The extensions to the new hospital, Dartford, are being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues and special inlet ventilators.

MR. HERBERT HOOKEY, a member of Messrs. Douglas Young & Co., auctioneers, has dissolved partnership and commenced to practice in conjunction with Mr. R. E. Hookey at 97 Cannon Street. Mr. Hookey entered the business over twenty-five years ago, and since that date has officiated in the rostrum at many of the important chattel auctions entrusted to the firm, including the realisation of the Newgate Relics and of the Liberator Assets and Hooley Estates, which were successfully carried out a few years ago.

THE heating and ventilating of the Natural History Museum, South Kensington, S.W., has been reorganised; the work in connection therewith was entrusted to the Bright-side Foundry and Engineering Company, Ltd., of Sheffield, and carried out under the supervision of the Chief Engineer to His Majesty's Office of Works.

MESSRS. W. F. STANLEY & CO., LTD., have put on the market "The Essex Calculator." It is designed to enable the engineer to ascertain rapidly and with fair accuracy the rates of velocity and discharge from sewers and water mains, the velocity of discharge in different forms of channel, and, by the introduction of another set of slides, the discharges from gas mains, compressed air mains or steam mains. The calculator is easily adjusted to any of the formulæ in common use, and appears from the directions for use to be simple in working. It is designed by Mr. E. H. Essex, A.M.I.C.E., A.M.I.M.E., and is sold at 7*s.* 6*d.*, or a smaller calculator at 4*s.* 6*d.*

AT Cornhill parish church, Northumberland, a memorial clock and bell to the late Mr. and Mrs. Collingwood, Cornhill House, was dedicated last week, Messrs. W. Potts & Sons, Leeds and Newcastle, being the makers, who are also making the large clock with four illuminated dials for the Royal Grammar School, Newcastle, Northumberland, from the plans of the late Lord Grimthorpe.

THERE are many considerations of supreme importance in the manufacturing world attaching to the locality in which a particular industry may be carried on, and it is no doubt owing to the recognition of this fact that the removal of works and factories from highly rated and congested districts to more suitable places is a frequent occurrence. Amongst the principal factors which have a determining effect upon these migrations may be mentioned the provisions of the new Patent Law, the labour question and rate of wages, and contiguity of ports, coal and iron fields, and centres of population. The vital question of economy of output, so necessary in these days of competition, is materially affected by the choice of locality, and it is claimed that nowhere can these advantages be better secured than in the districts of England and Wales served by the Great Western Railway. Those who would obtain further information on sites procurable in the vicinity of London, the West of England, the Midlands and Wales are asked to apply to Mr. T. H. Rendell, chief goods manager, Paddington Station, W.

WHILE many engineers and architects have not adopted building entirely in reinforced concrete, a large number have recognised the utility of this method of construction in floors, roofs and lintels. The stiffening of floors by the introduction of steel, either in rods, beams or expanded metal, is a general practice nowadays, and even the most conservative members of the professions are departing from the old procedure of forming the heads of openings with timber lintels and relieving arches. Concrete lintels have been found to be more ready and durable, and for spans which exceed the width of an ordinary door or window opening tension rods of steel are frequently inserted in the lower section of the beam. The Trussed Concrete Steel Company, Ltd., of Caxton House, Westminster, have placed upon the market a complete lintel reinforcement on the Kahn bar principle, and for flat-headed openings this Kahn trussed lintel is decidedly advantageous, as by its introduction the surrounding concrete is considerably strengthened. Although their published list only illustrates and details particulars of the eighteen standard types of lintels, it is claimed that spans up to 40 feet are as feasible as those of 10 feet, although in the former case it is recommended that the company's engineers should be directly consulted. The list is an indication of what may perhaps be termed the decentralisation of reinforced concrete construction, which enables the architect or engineer to employ it in certain portions of his works, in instances where a structure entirely erected of reinforced concrete would not suit the requirements of himself or his client.

VARIETIES.

THE Army and Navy Auxiliary Co-operative Supply, Ltd., have obtained the sanction of the London County Council for the erection at their premises in Howick Place and Francis Street of a fourth storey addition to be used as a store-room only.

MR. WALTER ARMSTRONG, constructional engineer to the Great Western Railway Company, has been appointed engineer to advise the Reading Corporation upon the most suitable site for an additional bridge across the Thames for vehicular traffic, and to prepare an estimate of the probable cost.

AT Falkirk Dean of Guild Court plans were unanimously approved for the erection in Hope Street, Falkirk, of a theatre to be known as Falkirk Hippodrome. The plans showed a commodious building having seating accommodation for 1,800 persons. The three tiers will be constructed on the cantilever principle.

THE Wood Green District Council has decided to apply for sanction to borrow 31,150*l.* for the purpose of obtaining a bulk supply of electricity and distributing it to consumers. Five years ago the Council asked the Local Government Board for a loan of 40,000*l.* to generate and supply electric light, but the Board refused the application.

THE sewage committee of Glasgow Corporation recommend the Town Council to accept the offer of Messrs. William Beardmore & Co., Ltd., Dalmuir, to construct for them an additional sludge steamer in connection with their sewage precipitation works. Ten offers were received. That of Messrs. Beardmore amounted to 25,550*l.*

RUBEROID
SYSTEM OF ROOFING

THE
RUBEROID
SYSTEM OF ROOFING
has stood the test of 17 years' actual use, and time has proved it the best, both on boards and concrete. RUBEROID is made in three colours: Grey, Red, and Green. It is suitable for the most permanent buildings, while its low cost makes it an economical covering for temporary structures.

THE municipal buildings committee of Glasgow Corporation are considering an estimate by Messrs. Douglas, Hunter & Whitson, in which they state that the approximate cost of the proposed alterations on the second floor of the Municipal Buildings will be about 3,000*l.*, including all necessary fixtures and repainting, but not furnishings. If the larger scheme be carried out the additional cost will be about 1,200*l.*, or a total of 4,200*l.*

MESSRS. LAW & HARRIS, architects, Northampton, report of the tower and spire of the Kingsthorpe parish church:—"The top stone of the spire, immediately under the finial, is cracked and is in a most dangerous condition; there is also a very ominous fissure a little below this stone. It is, in our opinion, absolutely necessary that the top of the spire be taken down for a distance of about six feet and rebuilt."

THE committee of the Royal Alexandra Hospital, Rhyl, have let the contract for building the wing for convalescent patients which is required to complete the hospital buildings, and the work is to be put in hand at once. The contractors are Messrs. Morrison & Son, of Wavertree, Liverpool, who are building the Liverpool Cathedral, and they have undertaken to complete the work in eleven months. The total cost is estimated to be about 14,000*l.*

AN application was made and plans submitted by Mr. Oliver, architect, last week, for the erection of a new grand stand and other improvements to be carried out at Molineux Grounds, Wolverhampton. It is proposed to build the grand stand on the terrace portion of the grounds to accommodate visitors at football matches. The cost will be 500*l.* The application was granted to the Wolverhampton Wanderers Football Club.

MR. JOHN GALLIMORE, Newcastle-under-Lyme, has died at the age of eighty-one. For many years he was the leader of the Liberal party in the borough. In 1879 he was Mayor, for twelve years he was Chairman of the School Board, and for a quarter of a century he was Chairman of the North Staffordshire Master Builders' Association. As a young man he built a church at Odd Rode, Cheshire, and, incurring losses by the undertaking, he made a composition with his creditors. Years afterwards he paid them all in full with interest. He was known as "Honest John."

FRASERBURGH Town Council have under consideration an extensive new water supply scheme. Mr. W. Allan Carter, C.E., Edinburgh, has prepared a report on the proposal. The water is to be taken from Fedderate, New Deer, a distance of fifteen miles from Fraserburgh. The estimated total cost of the undertaking is 45,800*l.*, which includes the making of a reservoir capable of containing 51,000,000 gallons or a ten weeks' supply for the town. The daily supply available from the new source would be 690,000 gallons.

THE Bromley Urban Council have approved a scheme for the erection of a fire station for self-propelled fire appliances, the provision of those appliances, and the erection of men's quarters adjoining. The estimated capital expenditure was put at 5,005*l.*, 3,855*l.* of this being for buildings and the remaining 1,150*l.* for providing a self-propelled fire engine and a first-aid machine. The estimated annual expenditure, in the event of the adoption of this scheme, is 957*l.*, or, if the suggestion that the engine be drawn by horses be agreed to, 1,045*l.* Detail plans and quantities are to be prepared.

THE Doncaster Rural District Council have instructed Messrs. D. Balfour & Son, of London and Newcastle-on-Tyne, to report on a scheme of main sewerage for the 776 houses proposed to be built for Bentley Colliery, and also further developments up Askern Road and Bentley. The scheme consists in the laying of considerable lengths of cast-iron pipe sewers on concrete foundations and the construction of a pumping-station, which will include a storage tank, from which the sewage will be pumped by means of electric motors and centrifugal pumps to the disposal works.

MR. H. R. HOOPER, an Inspector of the Local Government Board, held an enquiry at the Council House, Birmingham, last week, into an application made by the City Council to the Local Government Board for sanction to borrow 149,350*l.* for purposes of the electric supply undertaking, 16,600*l.* for works of paving, and 2,200*l.* for works of sewage. Mr. Prideaux, in making the application, dealt first with the 149,350*l.* loan. He said that 100,000*l.* of that amount was required for an extension of the underground mains, rendered necessary by the rapid increase in the demand for electrical current in the city.

MR. LLOYD-GEORGE received on the 2nd inst. a deputation from the Garden City Association, which placed before him

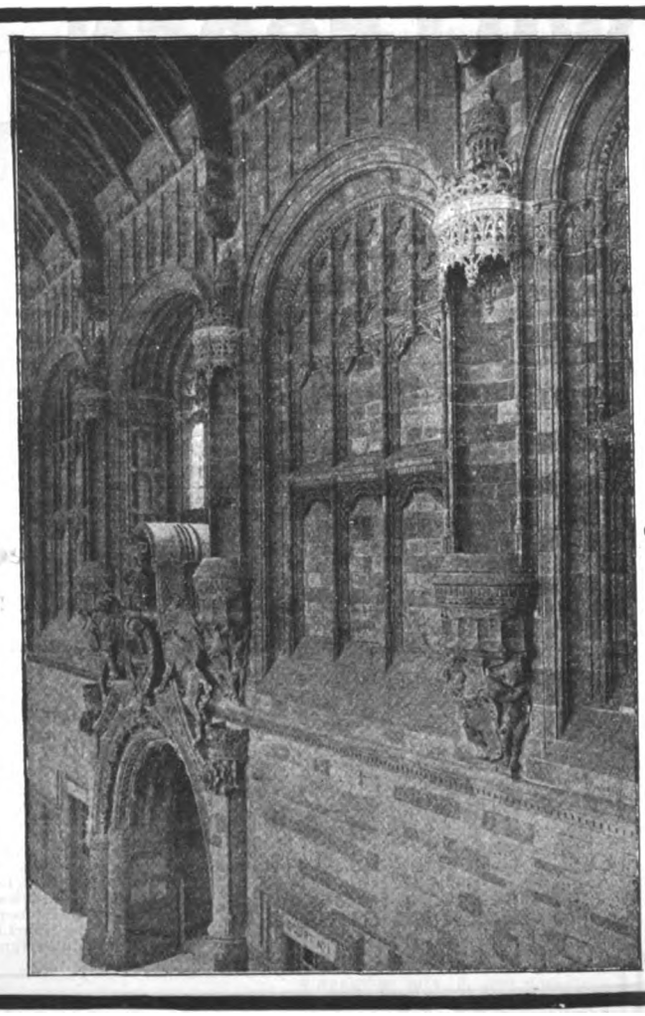
the points on which it was thought that the Budget would affect garden city schemes. One of the points urged was that land which was not built upon in accordance with the settled plan of development should not be treated as undeveloped land for the purposes of the tax, although no buildings are erected upon it. Another suggestion the Chancellor of the Exchequer was asked to consider was that every provision should be made to ensure that the carrying out of a town-planning scheme should not entail loss by the owner consequent on his leaving the land unbuilt upon. Mr. Lloyd-George replied to the deputation, but his reply is to be regarded as confidential.

THE award of Mr. A. A. Hudson, the arbitrator appointed to settle the dispute between the Master Builders' Association and the various operative societies in Southampton and district has been issued, and the new and revised rules came into force on the 2nd inst. The most important alterations made in the rules by Mr. Hudson are that the working hours are now reduced to a fifty-three-hour week, viz., cease work at 5 p.m. for the first five days, and noon on Saturday. The wages remain as present. With regard to the rule for overtime, the first two and a half hours of overtime will be paid at the rate of time and a quarter; after that till starting time next morning the rate will be time and a half. This does away with the double time for night work. The carpenters are allowed one and a half hours' notice in place of one hour, as previously. There is no alteration in the walking time rule. There is a new rule inserted for settling all disputes within ten days, failing which either side may apply to the Board of Trade to appoint an arbitrator, whose decision shall be final and binding to both parties concerned. This clause comes in force on August 2, unless either party shall give notice to the other in writing that such rule is not agreed to.

THE London County Council, in October last, authorised expenditure of 25*l*. on the preparation of a scheme for the centralisation of the hot-water system at Cane Hill Asylum. The scheme, which has now been prepared, provides for the construction in the water-tower of a large central tank for the storage of hot-water, from which services will be taken to all points where supplies are needed. A series of thirty-six storage tanks located in the roof spaces of the wards, in which water is heated at present by live steam brought from the boiler house, will be put out of use. Heaters and circulating pumps to give the necessary temperature to and circulation of the water in the mains are to be installed in a central position in the vicinity of the water-tower. The cost of the work, which it is proposed to have carried out partly by contract and partly by labour employed directly under the supervision of the asylums engineer, is estimated at 3,600*l*. At present the weekly expenditure in coal consumption at Cane Hill Asylum averages 3.09*d*. per patient in excess of similar expenditure at the other large London county asylums, and this fact is attributed solely to the antiquated method of hot water distribution. The quantity of steam coal used averages 3,500 tons a year and costs about 4,200*l*. It is expected that a reduction of at least ten tons a week, or 520 tons a year, will be effected as a result of the proposed re-arrangement. At Claybury Asylum where similar work has been done, an even greater saving than this has resulted.

AT the invitation of the directors of the Golden West and American (U.S.A.) Industries Exhibition, a party of gentlemen last month inspected the industrial and commercial exhibits, to which there have been many recent additions. The visitors were conducted over the exhibition by Mr. Hartley, Mr. Hart and Mr. Garnett, and Mr. J. W. Ryckman, the commissioner for the United States. It has been estimated that the exhibits represent capital actively engaged in industries, railroads and development enterprises in the United States amounting to over 300,000,000*l*. The most recent addition is the installation by the Southern Pacific Railway Company in the Royal Galleries of a pictorial exhibit of the beauties, wealth and potential resources of the southern and south-western portions of the United States. The walls are covered with large photographs of scenes taken along the lines of the Southern Pacific and its associated companies. Half-hour "talks," profusely illustrated by means of both still and animated pictures, are given each afternoon and evening, admission to which is free.



A LARGE number of City men in connection with the Central Y.M.C.A. have planned the erection of new headquarters for the Y.M.C.A. which shall include technical college and hostel. This is to be erected on an island site in the Tottenham Court Road at a cost of 140,000*l*., of which

there remains about 80,000*l.* yet to be obtained. The building will prove the finest of its kind yet erected in the British Isles, and a distinct acquisition to the Metropolis, with its handsome façade. Two of its important departments consist of (1) a business man's college and (2) a hostel for young men. In the former, which is to be located on the second floor, a completely equipped educational department is to be installed for supplying the needs of young professional and commercial men. Provision is being made for a laboratory, class-rooms, reference library and lecture-rooms. The department is to be placed under the control of a fully qualified director of education, who will plan the syllabus in order to secure the maximum of assistance to the students for the London University or Civil Service examinations, and also for specialised courses of study in banking, insurance, accountancy, architecture, shipping and forwarding, as well as the textile industries and other trades. The committee hope to make it possible for the young man to receive guidance not only as to his studies but also respecting his future business or profession. The accommodation for the hostel will be provided in the upper floors where 200 bedrooms are to be reserved at a moderate rent for young men desiring comfortable lodgings.

THE LONDON ASSOCIATION OF MASTER DECORATORS.

THE first annual general meeting of this Association was held at the Holborn Restaurant on Monday, June 7, when a large number of members were present. The meeting was a most successful one, and the President, Mr. H. A. Campbell, made some interesting statements as to the useful work done by the Association during the first year of its existence, and dealt at considerable length with the work which it has in hand for the current year.

The following office-bearers were re-elected:—President, Mr. H. A. Campbell (Campbell, Smith & Co.), 25 Newman Street, W.; Vice-President, Mr. John Anderson, 4 Clareville Grove, South Kensington; Treasurer, Mr. J. J. Honeychurch, 30 Queensdale Road, Holland Park, W.; and the following gentlemen were elected to fill the vacancies arising on the committee in accordance with the rules:—H. H. Holliday, 1 Harrington Road, South Kensington; F. De Jong, 84 Albert Street, Camden Town, N.W.; C. E. Wilkinson, 49 Marloes Road, Kensington; R. Salisbury (Salisbury & Co., Ltd.), 69 Walton Street, S.W.; William Morris, Ruskin House, Rochester Row, Westminster, S.W.; H. W. Sanders, 92 Crawford Street, W.; W. J. Renshaw, 287 Upper Richmond Road, Putney, S.W.; Chas. Saul (Messrs. Johnson, Saul & Co.), 36 Thurloe Place, S.W.

The other members of the committee (who remained in office) are:—F. Dakin, 151 Upper Richmond Road, Putney, S.W.; A. Andrews (Jones & Andrews), Crescent Works, Beckenham, Kent; A. Campbell (Campbell & Christmas), St. Oswald's Studios, West Brompton, S.W.; F. Charman (Charman & Walton), 30 Wells Road, Sydenham, S.E.; F. Chesterton (G. & A. Brown, Ltd.), 167 Hammersmith Road, S.W.; G. Colley (B. Colley & Sons), 135 & 137 Portland Road, S.W.; R. W. Jeffries (W. Jeffries & Sons), Crawford Street, W.; C. W. Patten, 35 Great Ormond Street, W.; T. S. Rowden (Rawlings Bros., Ltd.), 82 Gloucester Road, S.W.; Herbert Sheppard (Sheppard Bros.), Snakes Lane, Woodford Green; H. Stephens (Stephens & Son), 13 Hill Street, Woolwich; Henry E. St. John (J. H. St. John & Sons), Seymour Place, W.; Arthur Webb, Langthorne Works, Romford Road, Stratford, E.

The first annual dinner of the Association was held under the presidency of Mr. H. A. Campbell at the Holborn Restaurant on Thursday, June 10, when about fifty members and a few friends were present. Amongst the guests were Mr. J. D. Crace, President of the Incorporated Institute of British Decorators; Mr. J. Puttrell, President, and Mr. W. G. Sutherland, Secretary, of the National Association of Master House Painters and Decorators.

Mr. Alexander Davidson, 21 Finsbury Pavement, E.C., the Secretary of the Association, will be glad at all times to hear from any member of the trade who may think of joining the Association, and to give them any information they may require.

A NEW elementary school at a cost of about 14,000*l.* is to be erected at Winton, Bournemouth.

CONSIDERABLE activity is to be observed in the building trade at Torquay. The town is extending rapidly in the direction of Paignton.

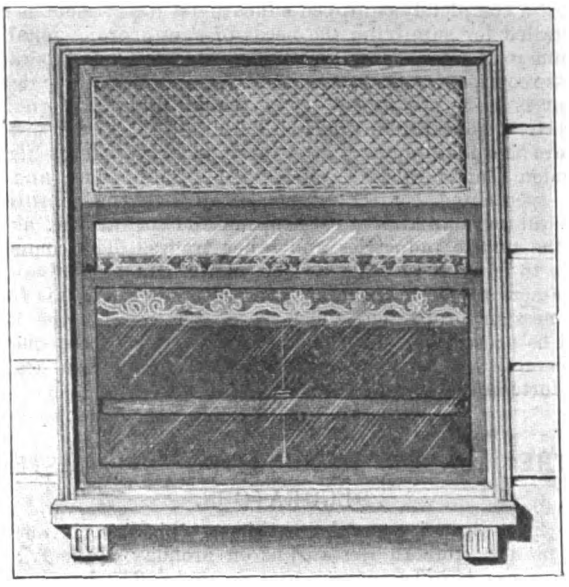
AN OPEN WINDOW SCREEN.



THE growing cult of the open bedroom window received something of a check when a short while ago some learned scientists were emphatic in their demonstrations that the ingress of night air was accompanied by grave risk. The view offered was that during the day the sunlight counteracted the poisonous gases, but that at night these arose unopposed, and made their way wherever opportunity offered. Apparently they derived particular satisfaction from entering the apartments of those who were lulled to sleep in the blissful belief of hygienic surroundings. Whether this theory be correct or not it is undeniably true that the open window, whether of bedroom or living room, does admit other things besides health-giving ozone—damp, for instance, and smut, not to mention fog and rain. In spite of these troubles the hatred of a stuffy atmosphere generally proves victorious, and the window is consequently left open at the top.

What we now illustrate is a device which allows pure air to enter unchallenged, while offering the stoutest resistance to everything else. Its full name and description is

"Morris's Sanatorium Window Screen—a screen consisting of a frame wherein are mounted two adjacent panels of perforated or reticulated material, between which is disposed a sheet of foraminous material." In our illustration one of the wicker-work panels has been dropped on its hinges so as to show the inside where the gauze or muslin is fixed. It is this stretched material that acts as the filter; it can be renewed as often as necessary at an infinitesimal cost. The rest of the screen has nothing that can wear out or get out of order. It is quickly hooked into the window frame.

Our second view shows from the outside the screen inserted into the upper part of the casement. To obtain full benefit, the top of the blinds and curtains would be below the screen, so as to afford an uninterrupted passage to the air when the top sash is lowered.

SCREEN FITTED INTO SASH WINDOW.

In the case of hospitals and sanatoria the screen can be made of a size to fill the entire window so as to allow the maximum quantity of filtered air to enter. This very simple invention is also cheap, for there is nothing in it to cost money in the making. A domestic improvement of this kind might never occur to a masculine mind, and the credit of producing it is to be given to a lady, Mrs. Harry W. Morris, 241 Ardgowan Road, Catford, S.E. We understand arrangements are in progress for its manufacture on an extended scale.

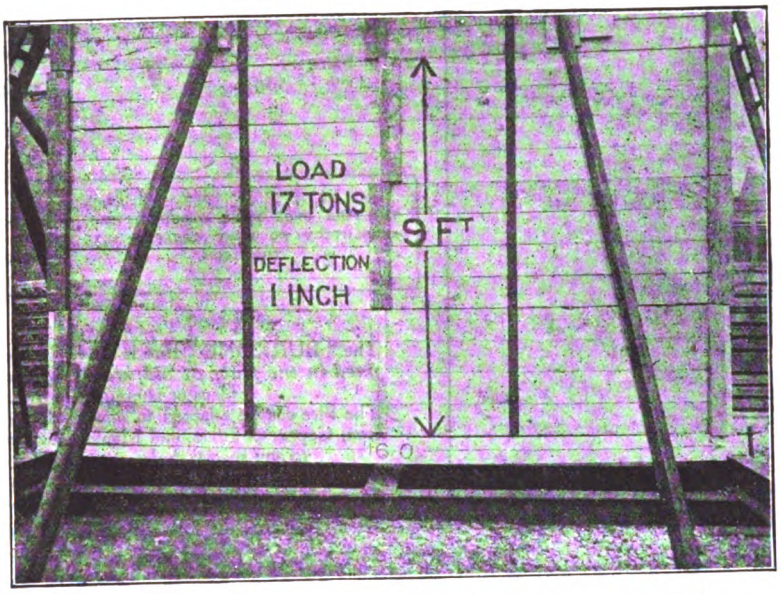
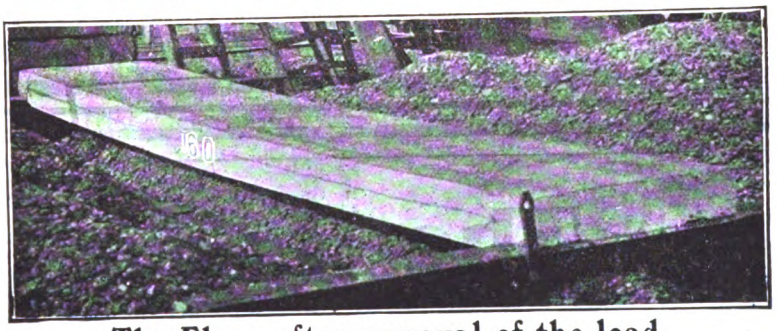
FAWCETT'S MON'LITHCRETE



STEEL GIRDERS

are lattice girders minus compression web members, and in combination with concrete are more than double the strength of joists of equal weight.



For prices per ton and for estimates apply :—

Fawcett Construction Co., Ltd.,

Tunnel Avenue, East Greenwich.

14 cwts. per foot super. on Mon'lithcrete Floor.

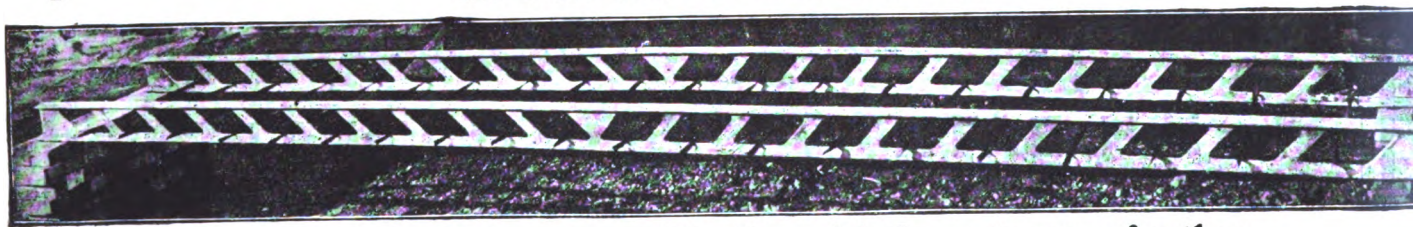
The Floor after removal of the load.

Distributed Load in cwts. that one foot will carry at one-fourth the breaking weight—

(63)

Divide by the span in feet and by the working load in cwts. to find the Spacing in Feet.

EXAMPLE.



Span 15 Feet.

Load 1½ cwts. per foot.

Or about 2′ 9″ to 2′ 10″ Centres.

Mon'lithcrete Girders in combination with Concrete are safer than Reinforcing Bars.

"The general results of the tests must certainly be considered as highly satisfactory, and as substantiating the claims put forward on behalf of this method of floor construction in respect of strength and rigidity."—THE BUILDER, February 20, 1909.

"It is claimed for this system of construction that it provides the same safeguard against the expansion of concrete as does the use of reinforcing bars, and this seems to be a justifiable claim, considering how perfectly the concrete is held by passing through the webs of the joists."—THE BUILDING NEWS, February 12, 1909.

"The aim of the inventor, Mr. Mark Fawcett, has been to obtain monolithic construction not by using concrete reinforced by bars and loose or fixed stirrups, but by using what might be described as lattice girders from which the compression members have been removed; in other words, rolled steel girders with large rhomboidal-shaped openings in the webs and tension bars pitched at an angle of 45° to the right and left of the centre, leaving the webs solid at each end to resist shear, whilst the top flanges are reduced to two-thirds the sectional area of the bottom flanges.

"The result is that the steel beams, reduced in weight 40 per cent. from the British standard, are capable of carrying at least 50 per cent. more load. The new floor has besides the advantage that an aggregate, as broken brick, can be used for the concrete, possessing greater resistance to fire and less conductive of sound than ballast concrete ordinarily employed in reinforced work."—THE ARCHITECT, February 26, 1909.

Mon'lithcrete Girders have known strength like ordinary steel joists.

Printed by SPOTTISWOODE & CO., LTD., at No. 5 New-street Square, E.C., and Published for the Proprietors by P. A. GILBERT WOOD, at the Office, Imperial Buildings, Ludgate Circus, London, E.C.—*Friday, July 9, 1909.*

FIBRO-CEMENT COCK BRAND SHEETS
AND SLATES

Registered under No. 260,349, January 20, 1904.

PANELLING OF A DINING-ROOM.

The ceiling and panelling of this room, as well as the door casing, mouldings and door panels, are done with Fibrocement.

A panelling of this kind costs less with Fibrocement than if done with wood, as all glueing and assembling is replaced by a simple nailing and the superposition of sheets of various thicknesses.

Compared with wood panels, ours have the great advantage of never "playing" and never giving occasion to numerous joints of paint inevitable with wood panels. Fibrocement never rots. Once fixed to the wall, it in no way loses its shape.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

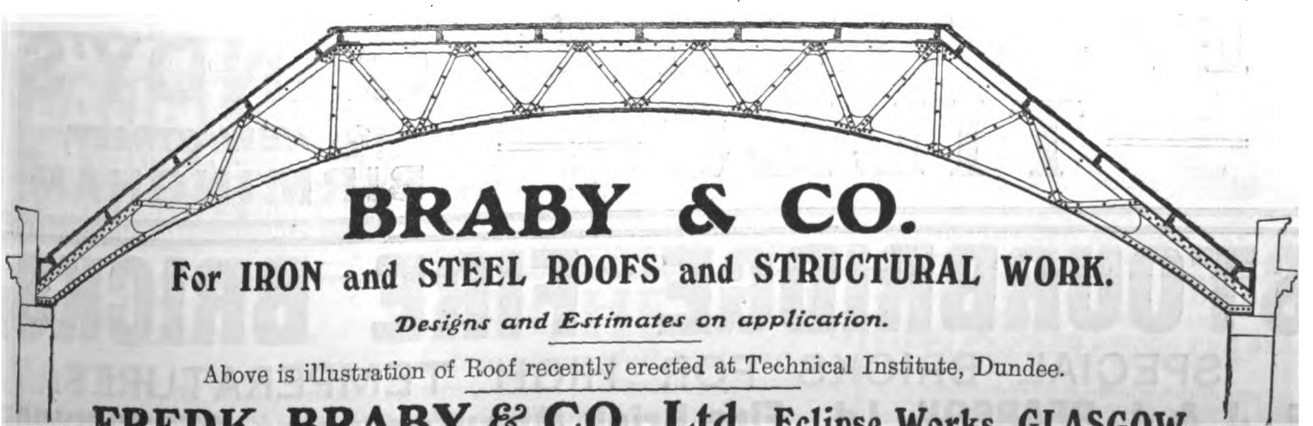
Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.



BURSLEM.—July 17.—For new public buildings. The author of the design placed first by the assessor will carry out the work. The architects placed second and third will receive premiums of 100*l.* and 50*l.* respectively. Deposit 2*l.* 2*s.* Mr. F. Bettany, borough surveyor, Burslem.

RECENT TESTIMONIAL.
[Copy] 46 Newcastle St, London, E.
June 8, 1909.

GENTLEMEN,—You will no doubt be pleased to hear that the "Sine Qua Non" Range we recently had from you is giving every satisfaction; we understand that the amount of coal consumed is practically one half of what the old range consumed.
We are, Gentlemen, yours faithfully,
(Signed for A. EATON & Co., LTD.,)
J. H. STONEHOUSE, Director.

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

& R. CORKER, Ltd.,

TRADE NOTES.

THE will of the late Mr. Edwin Verity of Leeds has been proved at the amount of 18,827*l.*

A COMPANY has been registered as the Midland Heating and Ventilating Company, Ltd., to carry on the business of heating and ventilating engineers at 82 Upper Trinity Street, Birmingham.

BEFORE deciding where to spend your holidays send a postcard to Publicity Department, 216 Marylebone Road, N.W., for A.B.C. excursion programme just issued by the Great Central Railway Company. It will give you valuable information in a concise form.

MESSRS. BRISTOWE & Co., of Broad Sanctuary Chambers, Tothill Street, Westminster, proprietors of the well-known material for dust prevention on roads and known as Tarvia, and the proprietors of the Parker safety pipe joint and the series of sanitary fittings known as the H.H., have registered their business as a private limited liability company.

MESSRS. MOULE'S Patent Earth Closet Co., Ltd., notify that after June 24 the offices and show-rooms are removed to their new and spacious premises, Doughty House, 2 Guilford Street, Russell Square, W.C. (Gray's Inn Road end), and as the new offices adjoin the company's workshops they afford increased facilities for rapid execution of orders.

WE understand that Messrs. F. G. Edey & Co., electrical engineers and contractors, of 29 Ludgate Hill, are removing on July 16 to larger and more convenient premises at 25 Warwick Lane, E.C. They have been established at Ludgate Hill for the past sixteen years, during which time they have carried out a large amount of important installation work in London and suburbs. In 1904 they introduced a maintenance department, which under careful supervision has met with the same measure of success as the other branches of their business.

IN our descriptive article on the Victoria and Albert Museum at the time of its opening by the King at the end of June we remarked that Sir Aston Webb kept the interior of the galleries remarkably simple in treatment. This statement was fully borne out by the photographs reproduced in the issues for July 2 and 9. That such apparent severity does not produce the effect of parsimony is owing to the able use of plain but high quality materials, and among these we must include the glazed brickwork, all of which was supplied by Messrs. Rufford & Co., of Stourbridge and London, through Messrs. Holliday & Greenwood, the general contractors. This firm make glazed bricks of every description, as well as baths, sinks, firebricks, &c.

AMONG the new companies that have just been registered are Bristowe & Co., Ltd., July 9 (27,000*l.*, in 1*l.* shares), Broad Sanctuary Chambers, Westminster, S.W.; and Lewes Portland Cement and Lime Company, Ltd., July 9 (30,000*l.*, in 1*l.* shares—15,000*l.* 5 per cent. preference), 24 Malling Street, Lewes.

IN our notice last week respecting the new heating and ventilating apparatus at the Natural History Museum it is suggested that the apparatus has been installed. But we are informed by the Brightside Foundry and Engineering Company that this is not the case. The work was started last year, and one-half of the apparatus was then completed, and the second and final portion is now being installed by them, under the supervision of the chief engineer of the Office of Works. The system adopted is quite unique and is a combination of heating by steam and hot-water radiators. The hot-water radiators are served by calorifiers (specially designed and made by the company at their Sheffield works), and fresh warm air is forced through the radiators into the rooms by means of fans. The galleries and other parts of the Museum are warmed and ventilated by a series of steam-heated radiators enclosed in galvanised-steel cabinets through which the fresh air is forced.

A PARTY of about ninety of the employés of Messrs. Heathman & Co., Parson's Green, S.W., with their friends, made a pleasant trip on Saturday last from Kingston-on-Thames by steam launch to Windsor, where the trippers made the most of the hour allowed on shore, some being sufficiently adventurous to climb the Castle tower, for which feat they were amply rewarded by the magnificent view. An excellent lunch and tea were served on board, the caterers being Messrs. Morris & Sons, of Richmond. Mr. and Mrs. Heathman with several others contributed to the musical programme, the accompaniments for which were played by Mr. Harold Hocking. As the launch neared Kingston on the homeward journey, Mr. Mitchell, the fore-

man of the works, proposed a vote of thanks to Mr. and Mrs. Heathman for their kindness and the trouble they had taken in providing such a capital day's enjoyment for all present. Mr. Heathman suitably replied, and after several other speeches the proceedings were brought to a close by the singing of "Auld Lang Syne" and "God Save the King" just as the party reached the landing-stage at Kingston, where all disembarked and wended their way home.

VARIETIES.

MR. T. K. RODDAM, C.E., A.M.I.C.E., has been selected, out of 107 applicants, for the post of burgh surveyor at Broughty Ferry, N.B., at a salary of 180*l.* a year.

ONE of the estimates of expenditure of the Orange River Colony in 1909-10 is 42,000*l.* for the re-erection of Government buildings destroyed by fire.

THE Kilmarnock master masons have agreed that the rate of wages should be reduced ½*d.* per hour for masons and bricklayers. This makes the standard rate for masons 8*d.* per hour and for bricklayers 8½*d.* per hour.

THE Derbyshire County Council have agreed to purchase a site of 4,494 square yards for the provision of additional County offices at Derby. The plot is opposite the existing offices, and will cost about 8,000*l.*

THE Rochdale Board of Guardians, who require the services of an electrical engineer for the plant at the workhouse, have received no fewer than 582 applications from all parts of the country. The salary offered is 50*s.* a week, with a house.

THE Local Government Board having written the Castleford Urban District Council as to the state of their Redhill reservoir, the Council have instructed Messrs. D. Balfour & Son, of London and Newcastle-on-Tyne, to inspect and test the reservoir as to its leakage, and report fully as to its being made watertight.

THE Board of Trade has intervened successfully in the dispute between the Manchester stonemasons and their employers. Both the master masons and the operatives have agreed to submit the matter in dispute to an arbitrator, who will be appointed by the Board. Pending the award of the arbitrator the operatives will at once resume work on the conditions that existed before the dispute began.

MR. JOHN B. THORP, who designed and built the representations of "Old London" last year at the White City, has made arrangements with the Golden West Exhibition committee to exhibit the work at Earl's Court. "Old London" will be found in the "Midway," and is proving a great attraction.

THE electrical engineer of the Newport Corporation is negotiating with a large firm for the supply of electrical energy in bulk. If the customer is secured, a large extension of the Corporation's plant, involving an expenditure of 70,000*l.*, would have to be made.

THE Rotherham Rural Council on Monday considered the report of Mr. J. J. Taylor, of Westminster, who had been consulted with respect to the projected schemes of water for the eastern portion of the district. The preliminary estimate is upwards of 20,000*l.* The matter was referred to a special meeting of the water committee.

THE Walsall Town Council on Monday adopted a recommendation that certain extensions and alterations at the electricity works be proceeded with at an estimated cost of 35,000*l.* A similar proposal was before the Town Council some time ago, and was then passed by a majority of one, but subsequently the whole question was referred to a joint committee.

THE housing committee of the Swansea Corporation at their last meeting approved of the principle of giving preferential terms to builders taking land for the erection of workmen's dwellings. The Corporation are having 160 houses built, and as showing the lack of housing accommodation in the town for workers, it was stated that there were four times as many applicants as the houses that are being built.

AT the last meeting of the Liverpool City Council, a proposal of the finance committee to obtain powers to make a grant of 5,000*l.* towards the erection of the building for an out-patients' department in connection with the Royal Infirmary was discussed. Some of the speakers objected to the municipality contributing out of the rates to the support of hospitals, but the Council, by forty-two votes to thirty-four, agreed with the finance committee's recommendation.

MR. JOHN HENRY GUNTER, of Middlesbrough, has been appointed to undertake the inspection of the whole of the steelwork for the transporter bridge across the Tees at Middlesbrough, at a fee of 220*l.*, the Middlesbrough Corporation to provide him with a third-class railway pass between Middlesbrough and Glasgow, where the steel is to be made. Mr. Hunter Scorer has been appointed inspector in connection with the bridge works, at a salary of 3*l.* 10*s.* per week.

A SCHEME for providing further educational facilities in Croydon, the total cost of which is estimated at 28,000*l.*, has been adopted by the Town Council, but it is not proposed that the whole of the work shall be taken in hand at once. It includes a boys' secondary school (16,000*l.*), enlargement of the Polytechnic to adapt it for a boys' higher elementary school (5,000*l.*), and a new elementary school (7,000*l.*).

AT the last meeting of Heath Town District Council, Wolverhampton, plans were submitted for the erection of a further number of houses at the Garden Suburb, Fallings Park. They did not show any drainage, and objection was raised to them on the ground that the owners of the land ought to construct a sewer along the street to connect the drainage with the public sewerage. The plans were referred back for consideration.

MESSRS. FRANK MATCHAM & Co., architects, 9 Warwick Court, Holborn, W.C., have prepared plans for the reconstruction of the Theatre Royal, Croydon, as an up-to-date theatre of varieties, which plans have been approved by the local authorities and by the ground landlord. The proposed building as reconstructed will have two tiers, will be capable of holding about 2,000 persons, and is designed on fireproof principles. The cost of the proposed alterations, including complete decoration and furnishing, is estimated at 15,000*l.*

AT the Southampton County Court, before Judge Guy, four building firms sued an architect who had advertised for tenders, and asked all the builders who tendered to deposit 1*l.* 1*s.* for the quantities. Plaintiffs deposited the guineas, but did not receive any quantities, and now sued for the return of the money. Judgment was given for the plaintiff in each case, to be paid in fourteen days. Mr. H. G. R. Aldridge appeared for plaintiffs.

THE Bradford baths committee have drawn up a revised scheme for the erection of district baths at Wyke, and it will be submitted to the City Council for confirmation in due course. The proposed new baths will be on the same lines as the other district baths in the city, but will not be quite so elaborate or so expensive. The estimated cost is 5,700*l.*, compared with 6,500*l.* and upwards of the other district baths.

WOOD GREEN District Council has decided to apply for sanction to borrow 31,150*l.* for the purpose of obtaining a bulk supply of electricity and to distribute it to consumers. Five years ago the Council asked the Local Government Board for a loan of 45,000*l.* to generate and supply electric light, but the Board refused the application. The Council now propose to obtain the current from the North Metropolitan Electric Supply Company. The supply undertaking will cost 27,000*l.*, house-wiring 2,500*l.*, and public lamps 1,750*l.*

THE Aberdeen Town Council had before them last week a recommendation by the water committee to make application for a provisional order in the session 1910 for authority to take a supply of water for the city from the river Avon, the estimated cost of the scheme being placed at 1,512,000*l.* for a supply of 20,000,000 gallons per day. As a section of the Council had previously expressed the opinion that the present was an inopportune time for proceeding with such a costly undertaking—in view of recent serious increases in the school and parish rates—it was agreed, on the motion of the Lord Provost, to defer consideration of the report till August 4.

THE Alnwick Urban District Council have adopted the report of Mr. J. C. Mellis, C.E., on the Alnwick sewage disposal competition. Mr. Mellis said he had gone over the twelve schemes submitted by eight competitors, and he recommended that the premium of 30*l.* be paid to Messrs. Spinks & Pilling, Leeds, for their scheme No. 2. The estimated cost was 1,586*l.* The addition to the existing main sewage disposal works comprised an alteration to the present septic tanks, a couple of percolating filters, and two storm-water settling tanks, with some more of the ground laid out for surface filtration, the estimated cost being 1,214*l.*, making the total estimated cost of works proposed about 2,800*l.*, as compared with previous schemes of 7,000*l.*, or so.

THE Great Central Railway Company have accelerated their service to and from Rotterdam by the running of a new Continental boat express with corridor carriages and restaurant car, from Liverpool, Manchester, Sheffield, and the Yorkshire district to Grimsby, where their fine turbine steamers take passengers with speed and comfort to Rotterdam. The boat service operates on Tuesdays, Thursdays and Saturdays, with a sea passage of only eight hours, and the turbine steamers *Marylebone* and *Immingham* are equipped with every convenience and luxuriously furnished, and, what is more, the boats are provided with the latest thing in water-tight compartments, controllable by the captain on the bridge, and are capable of being closed by him in eight seconds. The route via Rotterdam is the most direct and convenient for reaching Holland, North Germany and the Rhine, and the travel and hotel facilities afforded by Messrs. Dean & Dawson enable passengers to book through to all the principal business and holiday centres at a minimum expenditure.

CEMENT TRADE MARKS.

WE have received from L'Agence de Brevets et de Marques de Fabrique, Jacques Gevers & Co., 70 Rue St. Jean, Antwerp, the following list of trade marks of Portland cement manufacturers recently published:—

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

TRADE NOTES.

MESSRS. A. & T. BURT, LTD., of New Zealand, have opened a London office under the charge of one of their directors, Mr. J. A. Burt, to execute the buying for their New Zealand houses.

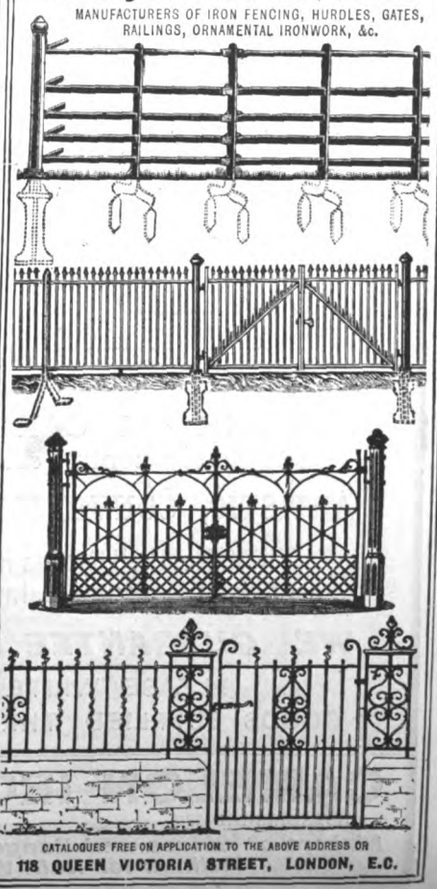
NEW premises have recently been erected at 92 High Street, Notting Hill Gate, London, for the London City and Midland Bank, Ltd., the interior fitting-up of which was entrusted to and beautifully executed by Messrs. Harris & Sheldon, Ltd., bank, shop and office fitters, Stafford Street, Birmingham. The work is carried out to the architect's design and specification in figured walnut, with bronze metal embellishments, and is another example of Messrs. Harris & Sheldon's accuracy of detail and superiority of finish.

A NEW INDUSTRY.

OUR attention has been called to an interesting inception of what at present is in its embryo stage merely a village industry, but bids fair to become of considerable importance. Lady Amy Baker recognising the possibilities of the white clay of Hampshire and Dorset, quite a different material from the china clay of Cornwall, has been making experiments with this clay, both alone and combined with others, and has shown the possibility of producing, merely by the burning of mixed clays with the white as a basis, quite a remarkable material, much resembling marble in appearance, and capable of an excellent polish. The artistic merit of the resulting product is that the exact disposition of the mingled veins of colour is fortuitous, and so has much of the charm of natural veining in marble. The practical merit is that as regards durability, hardness and strength, the material is a high-grade type of pottery. Thus whether the pure white clay is used, which when burnt is much of the colour of Bath stone, or coloured mixtures, there is a large field open for the application of the new material.

THE directors of John Oakey & Sons, Ltd., have declared an interim dividend on the ordinary shares for the half year ending June 30 last, at the rate of 10 per cent. per annum, payable on September 1, 1909.

MR. LEWIS JOHN ERIC HOOPER, nephew of the chairman, and Mr. John Cuthbert Bailey, J.P., for many years manager of the company's Burslem works, have joined the Board of Doulton & Co., Ltd.



THE Southend-on-Sea Corporation propose spending nearly 14,000*l.* on electrical sub-stations at Chalkwell Park and the Thorpe Hall estate, in the western and eastern portions of the borough respectively.

THE Marylebone Borough Council have under consideration the selection of a site for a new town hall to be built, at an estimated cost of 44,000*l.* The sites mentioned are that occupied by the vacated girls' charity school, Marylebone Road, and one in Seymour Place, off the same road.

VARIETIES.

MR. THOMAS HISCOCK, of Hounslow, builder, left estate valued at 23,471*l.* gross, of which 9,036*l.* is net personalty.

MR. R. A. SKELTON, late surveyor to Sandgate, has been appointed surveyor and inspector of nuisances to the Wilton Rural District Council at a salary of 230*l.* a year.

MR. EDWARD GOOD, of Sutton in Holderness, Yorkshire, and of Hull, builder and contractor, who died on May 11, left estate valued at 54,391*l.* gross, with net personalty nil.

THE Weston-super-Mare Town Council have arranged to place a galvanised-iron roof under the grand pier, and thus provide shelter for 2,000 persons. Additional shelter accommodation also is to be provided on the parade.

A LOCAL GOVERNMENT inquiry was held in Bedford last week regarding the proposal of the Bedford Corporation to borrow 15,000*l.* for a dust destructor, 25,775*l.* for completion of the water supply scheme, and 11,000*l.* for enlarging the mains.

A SERIES of eight or ten articles on "The Wiring and Fixing of Telephones" has been commenced in *Electricity*. It deals with ordinary installations and should appeal to everyone who has to instal, maintain, or repair telephones. A special feature is the original diagrams.

THE foundation stones of the Thornton Heath Spurgeon Memorial Church were laid on July 19. The building is of late Gothic design with red brick facings and stone dressings. The contract is let to Messrs. Battley, Sons & Holness, 21 Old Kent Road, S.E., and amounts to 3,215*l.* The architects are Messrs. George Baines & Son, 5 Clement's Inn, Strand, W.C.

DR. REGINALD FARRAR, Government medical officer, in his report on the sanitary circumstances of Oldham, recommends that the Corporation should acquire some of the many squalid empty spaces (the sites of old mills and dwelling-houses) which deface certain parts of the borough, and should convert them into gardens or playgrounds, properly fenced in.

THE Royal Sanitary Institute have appointed Professor Henry Adams, Dr. Louis C. Parkes, Professor W. Napier Shaw and Mr. A. Saxon Snell, F.R.I.B.A., as the adjudicators for the next "Henry Saxon Snell Prize" competition, the subject set being "The Principles of Heating and Ventilating Public Buildings." The essays have to be delivered at the Institute, 90 Buckingham Palace Road, by August 31.

WORKSOP College, Nottinghamshire, is to be enlarged. The new buildings will include a science block, drawing and music rooms, a dormitory, library, masters' rooms and class rooms. The gift of 10,000*l.* by Lord Mountgarrett will enable the permanent chapel to be built at the same time. The work has been entrusted to Sir Aston Webb, R.A. The building will begin at once, and the foundation-stone of the chapel will be laid on July 29.

THE Yarmouth Town Council have under consideration a scheme for the erection of public baths. A deputation inspected baths belonging to the Borough Councils at Battersea, St. Pancras, Islington and Beckenham, and the Turkish baths at Northumberland Avenue, the property of a private company. "Nearly all the groups of buildings visited," the report states, "were of the most complete type, and were more costly than anything which could be expected to be remunerative at Yarmouth." The borough surveyor has prepared plans which will cost 16,000*l.* inclusive of machinery. The matter has been deferred until October 1.

THE monthly meeting of the Yorkshire Federation of Building Trades Employers was held at the Albemarle Hotel, Scarborough, last week. A discussion took place with respect to a draft sub-contract for use of principals and sub-contractors, and it was subsequently referred to a committee to consider and report. Mr. T. Lindley, of Barnsley, explained the draft proposal agreement between the National Association of Master Plasterers and the National Association of Operative Plasterers. Several conferences had taken place between a joint committee, and as a result a draft agreement had been arrived at which was more favourable to the employers than the one it has been substituted for. The Federation passed a resolution approving of the revised agreement.

AUGUST BANK HOLIDAY ON THE CONTINENT.—Tickets at reduced fares available for eight days will be issued to Brussels July 28, 29, 30, 31, and August 2, and to Zurich

"HESTIA" GRATES WITH BLOWER
Register, Interior, or Mantel Register.

(PATENT)

Blower, Swing Canopy and Damper combined.

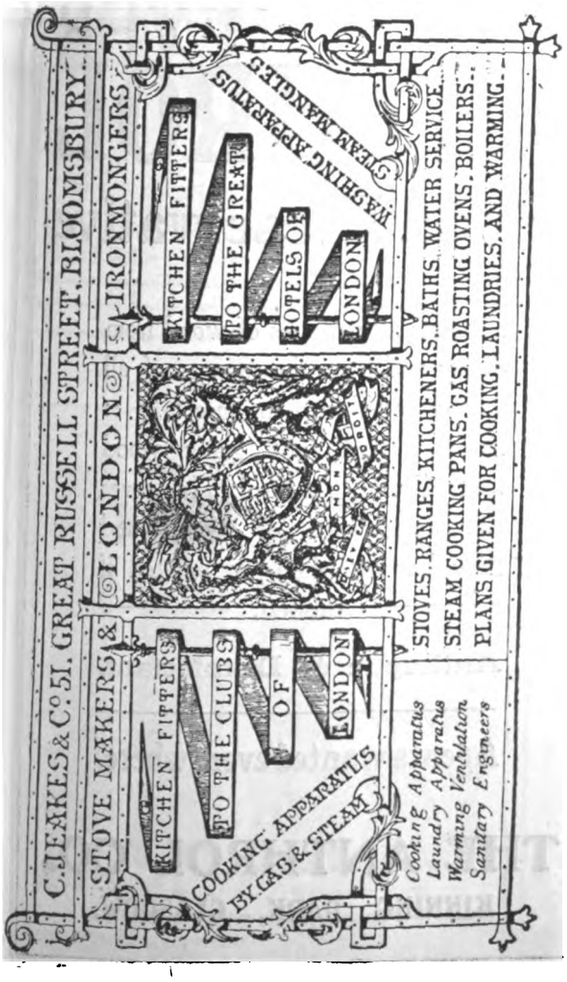
via Harwich and Antwerp. Dining and breakfast cars are run between London and Parkeston Quay, Harwich, on the Antwerp service. Passengers leaving London in the evening reach Brussels next morning, affer a comfortable night's rest on board the steamer. For visiting The Hague, Scheveningen (the Dutch Brighton) and Amsterdam for the dead cities of the Zuyder Zee, special facilities are offered *via* the Great Eastern Railway Company's British Royal Mail Harwich-Hook of Holland route. Turbine steamers between Harwich and the Hook of Holland, and corridor trains with vestibuled carriages, dining and breakfast cars between London and Harwich. From the Hook of Holland through carriages and restaurant cars are run to and from Amsterdam and in the North and South German express trains to Cologne, Bâle and Berlin, reaching Cologne at noon, Bâle and Berlin in the evening. Tickets can be obtained dated in advance and cabins or berths reserved at the Continental Enquiry and Booking Offices at Liverpool Street Station.

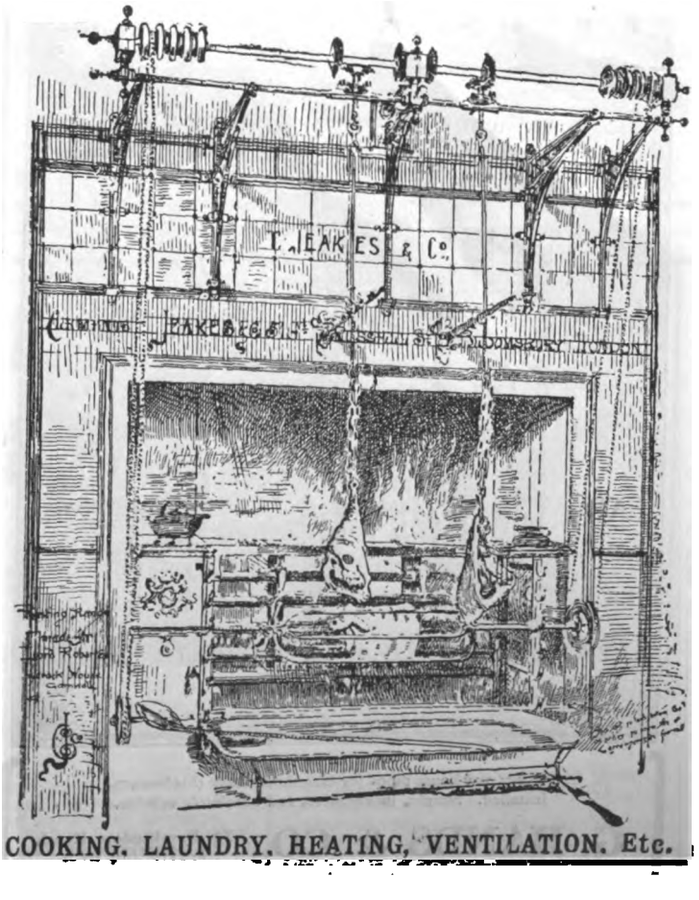
DR. H. W. BEACH, medical officer of health, Yarmouth, in the course of his annual report, says that during the year a portion of the North Denes has been laid out as building land, under the conditions of a garden suburb. This is an important step in the direction of proper town planning, and indicates a great change in public opinion during the past 25 years, as the adjacent Corporation estate was laid out to accommodate from 40 to 44 houses per acre, whereas there will not be more than five to nine houses per acre on the present estate, the area covered by buildings on the old estate being five-eighths of the whole site, while the corresponding fraction on the garden suburb will be from one-fifth to one-third. Although the houses on this particular estate will be too large for occupation by the working classes, its planning marks a great advance on any previous scheme for the development of the Corporation estates, and it will tend to the more careful consideration of future plans for the housing of the working classes.

NATIONAL REGISTRATION OF PLUMBERS.



THE Mayor of Winchester (Councillor F. W. King) presided at the annual meeting of the Hants, Dorset and Isle of Wight local Council of the National Registration of Plumbers. There was a large number of delegates, and among those supporting the Mayor were Mr. James Lemon, C.E. (chairman of the Council), Mr. Mathews, C.E., Mr. A. J. Crowther (borough surveyor, Southampton), Mr. Cooper (chief sanitary inspector, Bournemouth), Mr. Lord (city surveyor, Winchester), Mr. A. W. Bull, Mr. Morton, Mr. Stutchbury and others.

In opening the proceedings the Mayor said he fully realised the good work the Association was trying to do—namely, to educate the public up to the requirements of modern sanitation and to get rid of undesirable members of the trade. He knew the importance of this, as the evil effects of bad plumbing had been brought home to him, as he had nearly lost his life through serious defects in the sanitary work of a house he formerly inhabited.



Another subject he was glad to see the Association was taking up and that was the revival of apprenticeship. He hoped that not only plumbers but other trades would revert to the old system of apprenticeship, as he felt sure it helped to steady the character, as well as to make efficient workmen. It likewise settled lads into a definite course from the start.

Mr. Lemon said his first duty was to thank the Mayor for his kindness in presiding, and for granting them the use of the building for that meeting. He then proposed the following resolution, which was carried unanimously:—

"That this meeting of Master and Operative Plumbers, representatives of public authorities, water companies and the general public, desires to express its hearty approval of the system of registration inaugurated so successfully by the Worshipful Company of Plumbers, London, twenty-three years ago, which has developed into the great organisation of the National Registration of Plumbers, affirms its conviction that the system is conceived in the best interests of the craft and of the public health, is for the benefit of the community, and is therefore worthy of being maintained and pressed forward by all available means. The meeting would also urge upon master and operative plumbers who have not yet become registered to do so now, and by their co-operation and support assist in the attainment of the very desirable objects aimed at by the movement. The meeting further calls upon the Government to grant facilities for the re-introduction of the Plumbers' Registration Bill, which has twice passed its second reading in the House of Commons and passed through all its stages in the House of Lords, with a view of having it passed into law next session."

BUILDING TRADE IN GERMANY.

THE annual report on the trade of the consular district of Berlin for the year 1908 contains many interesting sidelights on the building trade of that capital and of the entire German Empire during the past year. Mr. Consul-General Schwabach lays emphasis on the general depression from which almost all branches of trade and industry had to suffer, though not to any alarming extent. One of the contributory causes to this absence of gravity in the economic situation was the decrease in labour disputes; and to this special notice will be given below. The principal cause, however, is considered to have been the growth of population, which enabled German industry during the last twelve months to depend upon the home market. Since 1882 the population has increased from forty-five to sixty-one millions. The classification of persons engaged in building may be taken as a typical instance. In the 1882 census the total was 946,583, or 5.84 per cent.; in 1895 the number was 1,353,637, or 7.16 per cent.; while in 1907 it had increased to 1,905,987, with a percentage of 7.74.

It appears from the structural iron and ironmongery statistics that the exports of girders, pipes, railway rails and enamelled kitchenware dropped during 1908, and, on the other hand, that the export of rough rails and blocks, as well as of iron rods and sheets, increased. The cement industry, which is largely dependent on its export trade, suffered severely during 1908, as exports declined considerably, this being especially the case in the purchases of cement by the United States. The largest customer is Austria-Hungary, where in 1907 as many as 682,088 tons were sold, while last year it fell to 520,345 tons; the figures for the United States are 79,835 tons and 29,267 tons respectively.

Strikes and Lock-outs.—The thrift of the working population has been of late years considerably checked and the economic development of the country greatly retarded by the large number of labour disputes. The year 1908 was practically free from such influences. This bears out once more an axiom taught by experience—namely, that in times when work is scarce the tempers of the quarrelsome elements are apt to cool down, while the diminution in the power of the unions and the favourable position of employers make strikes of rare occurrence. Similarly, the number and the extent of lock-outs are reduced, since this weapon is used chiefly by employers as a means of self-defence and as a deterrent against strikes.

In connection with the strike movement it is perhaps not out of place to direct attention to statistics showing the membership of the prime movers in these strikes. The following totals for Greater Berlin shows the membership of eighty of the greatest organisations of German workmen, the so-called "free unions" (with social democratic tendencies):—On January 1, 1906, the total was 223,339; twelve months later it had risen to 254,798; while on January 1, 1908, it fell to 235,980.

It is worthy of note that the membership decreased between January 1, 1908, and December 1, 1908, and that the building trade is exclusively responsible for this decline. The unions of masons and bricklayers and the labourers in these trades—i.e., woodworkers, joiners and painters—show throughout a decline in membership on December 31, 1908. The primary cause was, of course, the continued slackness in the building line, but there is also another reason; the more aggressive members of the different bodies, seeing that their unions were disposed to effect amicable settlements of disputes (the unions, indeed, being compelled in their own interest to adopt this attitude), turned their backs on them. In marked contrast to the "free" unions are the so-called "yellow" unions, whose special aim is the promotion of those interests which employer and employed have in common. Their numbers and their influence are at present very inconsiderable.

Scale of Wages Contract in the German Building Trade.—A general wages agreement which was arrived at in the building trade in the spring of 1908 terminated the fierce struggle which had been carried on for some time, and by this means a trade of great economic importance has been saved for some years to come from the constant danger of being involved in serious strikes and lock-outs through want of a generally recognised and valid collective labour contract. The employers, who are organised as the "German Employers' Association for the Building Trade," in the same way as the workmen have their compact central organisations, had drawn up a draft for the preparation of wage contracts, but this met with violent opposition on the part of the men. At one time it seemed as if no reconciliation

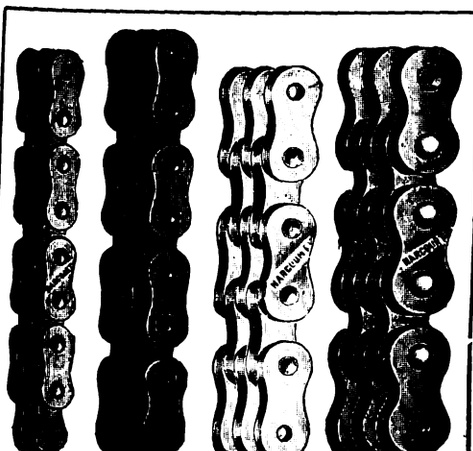
could be brought about between the Association and the workmen's unions, and it was expected that on April 1, 1908, 300,000 men would be locked out. However, at the last moment the two parties moderated their demands and an agreement was arrived at.

The reason the men had for not agreeing to the draft contract was that it contained stipulations likely to have an exceedingly injurious effect on their position. For example, the draft provided a rate of pay for "capable" workmen, and it was left to the discretion of employers to say who was to be regarded as a capable workman and who was not. Then, again, overtime was made compulsory, whereas previous contracts contained no such provision. Further, the draft, by forbidding "all attempts at agitation on working premises on pain of instant dismissal," made efforts of an agitatory kind impossible. It is true that previously agitation had not been altogether permitted, yet the prohibition had not been understood as applying to builders' shelters, whilst now, in the draft, these places were explicitly declared to form a component part of the working premises. Finally, the stipulation that whenever a local wages-list had been agreed to within the district of the Employers' Association, such list was only to apply after all pending disputes had been satisfactorily settled, and the instructions of the Employers' Association to local organisations not to reduce the working day below ten hours made the draft unacceptable to the men. The negotiations, which took place on March 25 and 26, between the representatives of the German Employers' Association for the Building Trade on the one hand and the leaders of the Trade Unions of Masons, Joiners and Builders' Labourers, including the "Christliche Bauarbeiter Verband," on the other, resulted in the men giving up their demand for the introduction of the eight-hour day, with the proviso, however, that wherever the working day was already shorter than ten hours it should remain unaltered. Further, and in deference to the wish of the men, the employers relinquished the stipulation that the agreement scale of wages should be guaranteed to capable workmen only.



One of the most hotly contested points was the question of agitation, but the protracted negotiations ultimately resulted in a compromise, expressed in the following clause of the agreement:—"Every kind of agitation during working hours is prohibited. Non-organised workmen, or those belonging to other organisations, must not be interfered with, either before or after working hours, or on the premises during intervals between work." As the result of a resolution, it was decided that the leaders of the men should accept March 31, 1910, as the date of the termination of the agreement, provided the question of the amount of wages to be paid was left to local arbitration. The agreement of March 25 and 26 provided a practical basis for the local negotiations for the determination of wages and working hours, which were to be concluded by April 18 and placed before the Employers' Union on April 22.

The negotiations for Berlin were opened on April 9 and 10. In their proposals the employers offered a wage of 65 pf. (nearly 8*d.*) per hour to masons and joiners, and of 45 pf. (5½*d.*) per hour to labourers, as against the rates of 75 pf. (9*d.*) and 50 pf. (6*d.*) respectively which had been paid up to the end of 1907. An ordinary day was to consist of nine working hours. In opposition to this the men asked for payment upon the scales embodied in a decision arrived at by the Arbitration Board of the Berlin Industrial Court, viz.:—

	Per Hour. Pfennigs.
1907 to end of March 1908 . . .	78
1908 ,, ,, 1909 . . .	80
1909 ,, ,, 1910 . . .	82

The employers declared that in view of the total change in the state of trade they could not agree to this scale, and negotiations were broken off as hopeless. On April 26 representatives from the central committees of employers and workmen met at Berlin in order to discuss the points of difference left open in the course of the local negotiations. Neutral arbitrators were appointed, and, after exhaustive deliberations, they made the following award:—(1) The scale of payment should nowhere be reduced; (2) wherever increased rates had been already agreed upon for the period included in the agreement such increments should hold good; (3) wherever local employers' organisations had, during the disputes, offered increases in the scale of wages, whether verbally or in writing, such increases should be unconditionally granted; (4) in districts where no rise of wages had

been granted from April 1, 1906, nor fixed in advance for April 1, 1909, the rate of payment should be increased by 1 pf. per hour, commencing on April 1, 1908; (5) in every district an arbitration board with a neutral chairman should be immediately appointed by the organisations concerned, and the boards should pronounce a final award by May 16 on those points in dispute not immediately connected with the wages question; (6) the parties must notify the neutral arbitration board not later than 11 A.M. on May 4, 1908, as to whether they are prepared to abide by the award or not.

On May 4, 1908, the above award was accepted by the men's organisations, and peace has thus been assured in the German building trade until 1910.

This agreement is of the greatest importance, not only to the building trade proper, but also to German trade as a whole, and it incidentally provides a means of judging the attitude adopted by the great bodies which represent masters and men in labour disputes. Impartial judges will be able to discern the great value attaching to the settlement of disputes affecting large interests by the representatives of organisations who have an insight into economic conditions and who are keenly alive to the responsibility vested in them; settlements on these lines are, in fact, a necessity whenever the number of masters and bodies of men concerned is so large that separate agreements would require laborious and protracted negotiations in order to attain uniformity.

Cement.—In consequence of the depression in private building activity the consumption of cement diminished. While in 1907 about 2,500,000 tons were used for Berlin buildings, over 500,000 tons less were required in 1908, a reduction due partly to the raising of prices by the syndicate, though outsiders continued to offer their products at cheap rates in Berlin; as, however, this competition only became acute in the second half of 1908, when the depression was still increasing in intensity, no perceptible effect was produced on the consumption. In view of the prevailing slackness and in order to create a demand, the syndicate reduced the prices for 1909 to the level of 1907, a measure dictated partly by necessity and partly with the object of counteracting the underselling tactics of outsiders, and particularly those of the new works in Upper Silesia, which are attempting to gain a firm footing in Berlin by means of considerable reductions in price.

As was to be expected from the favourable position of agriculture, building operations in the rural districts were livelier than in the cities, but it is very doubtful whether rural consumption was able to compensate for urban deficiencies. The activity displayed in the erection of public works, especially the continuation of canal construction, operated in some degree to increase the demand for cement, and the more extensive use of ferro-concrete is opening new fields, though Berlin builders are rather sceptical as to its advantages for buildings above ground. So far only a small number of Berlin architects have decided to adopt it to any great extent, in spite of the fact that in other parts of Germany the roofs, beams and trusses of large buildings are constructed with that material. It is believed that the use of ferro-concrete, by prolonging the time necessary for building, must increase expenditure on interest. As a matter of fact, ferro-concrete was largely used in the construction of the great warehouse on the Teltow Canal. In the construction of walls, pillars, &c., for bridges and underground structures this material has met with favour in Berlin, and some of the Berlin suburbs have placed considerable orders for concrete drain-pipes, some of which are to receive an acid-resisting coating.

WE notice that the Great Central Railway Company has considerably improved the train service between London (Marylebone) and the commercial centres of Yorkshire. This company inaugurated the general use of restaurant cars on the main line expresses, and the ability to obtain meals "per rail" is not only a great convenience but an appreciable time-saver. Buffet cars leave Marylebone at 8.45 A.M., 10.0 A.M., 12.15, 1.50, 3.15, 4.30 and 6.20 P.M. for Sheffield, Huddersfield, Halifax, Bradford, Wakefield, Leeds, York, &c. The 1.50 and 3.15 P.M. expresses from Marylebone have been accelerated for Denby Dale, Brockholes, Holmfirth, Honley, Huddersfield, Halifax, Bradford, &c., and the 3.15 has a non-stop run from Marylebone to Sheffield. Commencing July 16, through carriages for Scarboro' and the North-East Coast will be run on the expresses leaving Marylebone at 10.0 A.M. and 12.15 P.M., and an equivalent service operates in the reverse direction.

THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.

¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable subsiance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

DEPTFORD.—Sept. 1.—The Metropolitan Borough Council of Deptford invite designs for a branch library at New Cross, S.E. Premiums of 50 guineas, 25 guineas and 10 guineas will be awarded. (Builder, joiner, plasterer, plumber, slater, painter.) Deposit 1*l.* each. The West Riding Architect, County Hall, Wakefield.

WALES.—Aug. 2.—For erection of a goods shed at Risca, Monmouthshire, for the Great Western Railway Co. The Engineer at Newport Station.

WALES.—Aug. 5.—For erection of eighteen houses at Penyrheol, near Caerphilly, for the Bargoed and Abertridwr Building Club No. 2. Mr. P. Vivian Jones, P.A.S.I., architect and surveyor, Hengoed.

WALES.—Aug. 5.—For alterations and renovation of Albion Hotel, Aberaman, Aberdare. Mr. William Dowdeswell, architect, Treharris.

WALES.—Aug. 6.—For erection of higher elementary schools, with cookery centre, laundry and caretaker's house, at Stow Hill, Newport, Mon. Deposit 3*l.* 3*s.* The Architect, Town Hall, Newport.

WALES.—Aug. 7.—For extensions and alterations to the Abergavenny Girls' Secondary school. Deposit 2*l.* 2*s.* Mr. E. A. Johnson, architect, Abergavenny. Also for extensions and alterations to the Abertillery County Secondary school. Deposit 2*l.* 2*s.* Mr. R. L. Roberts, architect, Abercarn.

WALES.—Aug. 9.—For erection of a steward's dwelling house adjoining the club premises and for the construction of additions and alterations to the present Constitutional Club, Caerau, near Bridgend. Deposit 1*l.* 1*s.* Mr. J. R. Snape, solicitor, 3 Talbot Street, Maesteg.

WALES.—Aug. 9.—For erection of five pairs of semi-detached cottages at Merthyr Vale, for the Merthyr Vale Building Club. Mr. William Dowdeswell, architect, Treharris.

WALES.—Aug. 13.—For erection of a cottage hospital and appurtenances to be erected at Nantyglo, Mon. Mr. James Pitman, secretary, Cwmcelyn, Blaina, Mon.

WALES.—Aug. 12.—For erection of a church at Bedlinog. Deposit 1*l.* 1*s.* Mr. William Dowdeswell, architect, Treharris.

WALNEY (BARROW-IN-FURNESS).—Aug. 9.—For erection of a waiting-room and convenience on the Promenade. The Borough Engineer's Office.

WILLINGTON (DURHAM).—Aug. 6.—For the several works required in alterations to the Blue Bell Inn, Willington, Durham. Mr. T. H. Murray, architect and surveyor, Consett.

WORKSOP.—Aug. 4.—For the construction of an open-air swimming bath in Prior Well Road. Deposit 1*l.* 1*s.* Mr. G. Rawson, surveyor, Town Hall, Worksop.

MR. W. T. HALL, surveyor, of Shrewsbury, has been appointed as adviser to the small holdings committee of the Shropshire County Council at a salary of 400*l.* per annum, with 150*l.* for clerical expenses and 100*l.* for travelling. Some of the members regarded the salary as excessive, as Mr. Hall was not prepared to undertake to give up the whole of his time to the work of the Council, and for other reasons. Ultimately it was decided to ratify the arrangement for twelve months.

TRADE NOTES.

OUR attention has been called to the paragraph that appeared in our issue of July 2, relative to the surface-colouring of the walls of the new Victoria and Albert Museum. We understand that we were wrongly informed that the material of the Rapidal Paint Company was used on the walls of the new buildings, although they have supplied several tons to the museum, but that the well-known "Duresco" was specified by the architect, Sir Aston Webb, R.A., supplied by The Silicate Paint Company, of Charlton, S.E., and used on practically the whole of the interior wall surface of the new portion of the Victoria and Albert Museum.

MESSRS. E. H. SHORLAND & BROTHER, warming and ventilating engineers, Manchester, inform us that they are carrying out the following works:—The extensions to Sir Titus Salt's Hospital, near Bradford, are being warmed and ventilated by means of their patent Manchester grates; the extensions to the General Hospital, Cheltenham, are being warmed and ventilated by double-fronted patent Manchester stoves with descending smoke flues, exhaust roof ventilators and patent hygienic inlet ventilating panels; and the new Golf Club, Irvine, N.B., is being warmed and ventilated by means of Manchester stoves with descending smoke flues.

MESSRS. THOMAS LAWRENCE & SONS, Bracknell, supplied the facing bricks for the Orthopædic Hospital, Great Portland Street, W., which was opened by the King on Friday, the 23rd inst. Mr. Rowland Plumbe, F.R.I.B.A., the architect, specified medium and dark cherry-red hand-made facings. Messrs. Lawrence also supplied the whole of the facing bricks for the Pelham schools at Wimbledon (Mr. Burke Downing, F.R.I.B.A., architect), which have been illustrated in our two previous issues.

SOME interesting discoveries have been made in the course of the repairs being carried out at the Old Guildhall in Priory Park, Chichester. The removal of the plaster at the eastern end of this thirteenth-century building has displayed the whole plan of the east window, and three arcaded recesses a few feet above the floor-line have also been freed from the plaster. These recesses are unusual in both position and depth; possibly they were in a retro-choir and used for the preservation of relics. On the north side a beautiful trefoil-headed niche has come to light, which was possibly intended for an image of the Blessed Virgin, though it might have been an aumbry.

VARIETIES.

CROYDON Town Council has decided to apply to the Local Government Board for sanction to borrow 14,000*l.* for the purchase of a site at Russell Hill for the construction of a low-level reservoir and other works connected therewith.

THE Bath Town Council were informed on Tuesday that in the proposed alterations at the Grand Pump Room, Bath Street, respecting which there has been so much controversy, is not to be touched.

IN June of last year the parish church of Melrose, which had been erected in 1810, was almost completely destroyed by fire. The heritors at once set about making arrangements for the erection of a new church on the site occupied by the former church. Messrs. Peddie & Washington Brown prepared the plans, and estimates have now been accepted for the work.

THE education committee of the London County Council propose that instruction in wrought-iron work for buildings shall be given in one of the Council's technical institutes. As the subject has not been taught previously, the approval of the Council is necessary.

THE Manchester waterworks committee have resolved, subject to confirmation by the City Council, to let the contract for the third, or northerly, portion of the third line of pipes to convey water from Thirlmere to Manchester to Messrs. Morrison & Mason, contractors, Glasgow. At the same meeting it was reported that there was a supply of water in hand sufficient for 114 days' consumption, based upon a daily average of 41,000,000 gallons.

A CIVIL Service supplementary estimate of 467,401*l.* required to be voted for the year ending March 31, 1910, was issued on Tuesday as a Parliamentary Paper [232]. The following are the principal items:—The sum of 5,850*l.* is required for Menai Bridge. It is explained that this bridge is vested in the Commissioner of Works, but the net receipts from tolls after paying maintenance charges are carried to the credit of the Local Loan Fund. Extensive repairs have, however, now become necessary, the cost of which cannot be met from current receipts. Mr. Churchill's Labour Exchanges Bill entails an item of 70,000*l.* for buildings, 19,000*l.* for salaries, 6,000*l.* for travelling and incidental expenses, and 9,339*l.* for salaries and travelling expenses of additional staff in the Office of Works in connection with the provision of buildings. Expenses in connection with International Exhibitions at Brussels, Rome, and Turin require 60,000*l.*

AT the meeting of the West Riding education committee at Wakefield on Tuesday the elementary education sub-committee stated that they had accepted tenders for new schools as follows:—

School.	Amount.	Accommodation.	Estimate approved.
Featherstone	£3,836 18 10	360	£4,320 0 0
Kirkburton	3,870 10 7	250	3,667 0 0
Knottingley	5,622 2 0	510	6,659 10 0

It was also proposed that new elementary schools should be provided as follows:—Addingham (3,250*l.*), Scholes, Birdsedge (2,600*l.*), Gomersal (5,040*l.*), Horsforth (7,550*l.*).

A DEMONSTRATION was given at the Temple Pier Embankment, London, on Monday, of the porhydrometer, an instrument invented by Signor de Lorenzi for weighing with the utmost accuracy the dead weight placed on board or removed from any ship, barge or other floating vessel. As with many other inventions, the spectator is struck by its simplicity. The instrument is based upon the infallible principle that a body floating in a liquid of whatever density displaces a quantity of that liquid exactly equal to its own weight, and by its application the vessel is transformed into a gigantic weighbridge or weighing machine. In the centre of the vessel a vertical tube is placed connected by a pipe with the water underneath; inside this tube is the aerometer (a vertical float), which is affected by the rise or fall of the liquid according as the displacement of the vessel is altered. The float is connected by a lever to a steelyard on which the exact change of weight is recorded. At the demonstration on an empty iron barge the weight of anyone stepping on board anywhere was recorded on the steelyard. The general opinion expressed was one of great enthusiasm at the benefits likely to accrue to those connected with all kinds of shipping from the new invention.

THE INSTITUTION OF MUNICIPAL ENGINEERS.

A WELL-ATTENDED and most successful South-Eastern District meeting of the Institution of Municipal Engineers was held on Saturday, the 24th inst., at Ruislip, Mr. Henry C. Adams, A.M.I.C.E., A.M.I.M.E., A.M.I.E.E., District Chairman and Member of Council of the Institution, presiding. Councillor F. M. Elgood, F.R.I.B.A., F.S.I., chairman of the public health committee, offered a cordial welcome on behalf of the urban district council to the members, and in thanking him on behalf of the Institution, Mr. Henry C. Adams referred to the fact that although they were a new body, having been instituted only some fifteen months, they had received practically 1,000 applications for membership. Their ranks were open to all competent men engaged in municipal work, whether as electrical, gas, mechanical, or waterworks engineers, together with those who, like himself, had passed through the mill of official municipal appointments, and having reached the haven of private practice, were engaged in municipal work in a consulting capacity. They were affiliated to the National Association of Local Government Officers with a membership of 15,000; and the questions of security of tenure and superannuation were receiving the attention of the Council. Their technical library, which was being formed, contained many valuable books, and would be of the greatest service to the members whether residing in the provinces or in London; the proposed method of working it could be best summed up in the words "You send a postcard, we do the rest," as any book in the library would be sent on loan at the request of any member without any charge whatever.

Mr. W. Louis Carr, surveyor to the Council, read a paper on "The Sewerage and Sewage Disposal Works of the Ruislip-Northwood Urban District Council," and Dr. L. W. Hignett, M.B., C.M.Edin., D.P.H.Camb., medical officer of health, read a paper on "The Principles Involved in the Purification of Sewage," after which Mr. Carr conducted the members round the sewage works which have been recently altered and enlarged under the advice of Mr. H. Howard Humphries, M.I.Mech.E. The members subsequently adjourned to "The Poplars," Ruislip Village, for tea.

THE Southwark Board of Guardians propose to raise a loan of 50,000*l.* to acquire the Bow Infirmary, the property of the City Guardians, which is unoccupied, and negotiations have been entered upon with a view to purchasing the property.

AT the last meeting of the Mersey Docks and Harbour Board the proceedings of the works committee included a recommendation to deposit a number of concrete blocks, &c., on the river bed adjacent to the entrances to the Brunswick Dock, to check erosion, at an estimated cost of 5,000*l.* In accordance with standing orders the recommendation will be further considered at the next meeting of the Board.

LIGHTING OF PUBLIC STREETS.

IN March last a deputation of the streets committee of the Corporation of London appointed to visit certain Continental cities for the purpose of inspecting the various systems of public lighting, visited the following cities, viz.:—Brussels, Cologne, Düsseldorf, Berlin, Dresden, Vienna, Munich and Paris.

The deputation have now issued a report giving particulars of the different systems of lighting inspected, from which it will be seen that in every city, gas as well as electricity is used. Particulars are also appended of the lighting in the City of London.

In Brussels.—The main thoroughfares, squares and market places are lighted by means of electric arc lamps, with an ordinary incandescent gas burner on each side. The arc lamps are turned off at midnight, after which time the lighting is supplied by gas. The side streets are lit with incandescent gas.

Cologne.—The important streets of the city are lit by centrally hung electric arc and flame lamps, with lowering gear, the open spaces by a combination of electricity and gas, and the minor streets mainly by incandescent gas lamps upon standards.

Düsseldorf.—This city is lit in a somewhat similar manner to Cologne, arc lamps centrally hung and upon standards, and by incandescent gas.

Berlin.—The general arrangement for lighting is by means of electric arc lamps, centrally hung and upon standards, electric glow lamps, and high-pressure incandescent gas lamps with inverted mantles. The Berlin authorities have decided to spend seven million marks (350,000*l.*) in installing the latest patterns of high-pressure gas lamps with inverted burners in lieu of the existing gas and electric lamps. Expenditure in this direction has been going on for two years at the rate of one million marks (50,000*l.*) a year, and will be continued at the same rate for the next five years. The lamps used are graded according to the importance of the thoroughfares—at junctions of main streets, lamps of 4,000 candle power; in main thoroughfares, lamps of 2,000 candle power; and in other streets, lamps of 1,000, 600, 400 and 200 candle power, the 400 and 200 candle power lamps being on low pressure. So far as gas is concerned, four-fifths of the city is lighted by the municipal authority, and the remaining one-fifth by the Imperial Continental Gas Association. In some streets where the municipal authority and Association meet, the latter are putting in the same kind of burner as the former.

Dresden.—Electric arc lamps of the "open" and "flame" type are used in this city, a considerable number being suspended across the centre of the streets, with side lowering gear. Electric glow lamps are also used. The side streets are lit with low-pressure incandescent gas lamps. The electric arc lamps are switched off at midnight, leaving incandescent gas lighting only.

Vienna.—Electric arc lamps upon standards with incandescent gas lamps fixed upon brackets below, together with low-pressure incandescent gas lamps fitted with upright and inverted mantles.

Munich.—Electric arc lamps centrally hung and upon standards, also electric glow lamps and low-pressure incandescent gas lamps.

Paris.—Electric arc lamps upon standards, and low-pressure incandescent gas lamps. The general arrangements are the same as in London.

Having very carefully considered the various systems, the deputation are of opinion that the public lighting in the City of London can be materially improved, and have come to the following conclusions:—

1. That, wherever possible, streets should be lighted by means of centrally hung lamps with lowering gear. (This we think particularly important in the City of London where the number of obstructions upon the footways in the form of lamp posts, bins, letter-boxes, &c., is so large.)
2. That open spaces should be lighted by means of lamps upon standards, fitted with lowering gear.
3. That high-pressure incandescent gas lamps with inverted burners should be adopted as the illuminant, but where gas is impracticable, electricity with open arc and flame arc lamps should be installed.

It is thought, however, before suggesting any drastic alterations in the general lighting of the City, that the streets committee should be authorised to arrange for some further experimental lighting of the City thoroughfares.

The total number of electric arc lamps in the City of London is 450; 380 open arc lamps and twenty flame lamps

Scagliola Marble

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

SPÉCIALITÉ for surrounding Iron or Brick Cores.

These being fixed in the ordinary course of construction the SCAGLIOLA can afterwards be fixed round WITHOUT SHOWING JOINT.

Prize Medals, 1851 & 1862.

BY SPECIAL APPOINTMENT

TO HIS MAJESTY.

are fixed upon columns and brackets; the average distance between the open lamps is 126 feet, the average height of the lamps being about 18½ feet. The cost of each of the open lamps is 26*l.* per annum, and of each flame lamp 17*l.* 10*s.*

In accordance with the resolution of the Court of Common Council of July 25, 1907, permitting the two electric lighting companies having statutory powers in the City to experiment with the newest form of electric lamps for street lighting in the thoroughfares of Holborn, Holborn Viaduct, Old Bailey (part of), the lamps being placed about 20 feet from the ground, Cannon Street (between St. Paul's Churchyard and Dowgate Hill) at a height of 28 feet, and Farringdon Street at a height of 14 feet, the Charing Cross and Strand Electricity Supply Company proceeded with the lighting of their portion, viz., Cannon Street, by erecting eleven "Oliver" magazine flame arc lamps, centrally hung, and suspended over the roadway by wires attached to the buildings on either side. The lamps were put into lighting in November, 1907, and 17*l.* 10*s.* per lamp is the price paid for the experimental running. This is the price quoted by the company for a contract for not less than 250 of such lamps.

The City of London Electric Lighting Company also proceeded with the carrying out of their experiment by substituting twenty-one "Oliver" flame arcs for a similar number of the original "open" arcs, adapting the existing standards in Holborn, Holborn Viaduct, and part of Old Bailey, whilst in Farringdon Street eighteen enclosed arcs of the "Reason" type were fitted up on special short columns in lieu of the 12 original "open" arc lamps and columns in that thoroughfare. The installation of this area was completed in November, 1907. The cost of the "Oliver" flame arcs in the Holborn area is 17*l.* 10*s.* each per annum, being equivalent to the charge for similar lamps in Cannon Street. The cost of the enclosed arcs in Farringdon Street is 12*l.* 10*s.* each per annum. The "Oliver" flame arc lamps at Ludgate Circus and Ludgate Hill, put into lighting this year, are fixed at a height of 18.5 feet above the roadway, as against 20.5 with the experimental lamps of the same type at Holborn.

High-pressure Incandescent Gas Lighting.—There are 119 high-pressure Keith gas lamps in the City thoroughfares. These lamps consume 10 cubic feet of gas per hour, and give an illuminating value of 300 candles each, at a cost of 7*l.* 5*s.* per lamp. They are from 60 to 70 feet apart on the diagonal, the height of burner from roadway being about 12 feet. They are fixed upon the house fronts, the roadway being about 50 to 60 feet wide. The lamps burn at 10-inch pressure from a special water-compressing plant placed in the adjacent pipe subway. The Corporation provided the compressing plant, services, lamp brackets and lanterns. Forty-five upright two-burner lamps are fixed in Queen Victoria Street, each consuming about 20 cubic feet of gas per hour, and giving a light equal to 600 candles, the annual cost per lamp being about 13*l.* 2*s.* 3*d.* per annum. The lamps are fixed upon columns on the footpaths, about 100 feet apart on the diagonal. The burners are 13 feet 6 inches above the roadway, the street being about 70 feet wide. The lamps burn at 10 inches pressure from a high-pressure trunk main direct from the gasworks, the Corporation providing the standards and lamps. Seventeen high-pressure single-burner lamps (inverted mantles) have been fixed in Fleet Street and Chancery Lane upon brackets on the house fronts. These lamps each consume 25 cubic feet of gas per hour, and give a light of 1,500 candles, at an inclusive charge of 16*l.* 10*s.* per annum. They are supplied from a special 6-inch high-pressure main connected with a compressor house in the immediate neighbourhood, the pressure being 54 inches (water-gauge). These lamps are about 103 feet apart on the diagonal, the height of the burners from the roadway being 13 feet to 16 feet, the street being from 45 to 70 feet wide, the Gas Company providing the necessary compressing plant, mains, services, brackets and lanterns. There are also several other "Keith" and "Sugg's" high-pressure lamps, fitted with upright 2, 3, 4 and 6 burners, on rests at the junction of roadways, of 1,000, 1,300, 2,000 and 3,000 candles, making 119 in all. In addition to the above the four City bridges are lighted with "Sugg's" high-pressure upright burner lamps, some 135 in number, giving 30 candles to the foot of gas; they are single burner lamps with clusters on the centre of the bridges, and have been in lighting for about eight years, having been installed and maintained by the South Metropolitan Gas Company. The gas is compressed by separate gas and water driven machinery on the bridges, except at Blackfriars, where the gas is taken direct from the high-pressure main of the Gas

H. & C. Wrought Steel

"Louvre" Ventilators

Black Japanned,
White Japanned,
Nickel Plated,
Bronze Plated.
ALSO IN
Solid Wrought Brass
and Bronze Metal.

MADE IN 130 SIZES.
From 4 by 6 to 24 by 42.

Each Ventilator is packed in a separate cardboard box, and is furnished with one brass pulley (no cord or tassels).

ELEGANCE. LOW PRICE. NO BREAKAGE.
SPECIFIED BY ARCHITECTS.

These Ventilators being made entirely of **Wrought Steel,** breakage either in transportation, in stock or in use, is practically impossible.

They are light in weight, with a consequent **Saving in Carriage.**

The Operating Slide is made of very heavy gauge steel, and is especially **strong** to insure against breakage and guaranteeing a free and positive operation.

Each Ventilator is packed in a separate cardboard box, and is furnished with one brass Pulley (no cord or tassels).

Sold by all First-class Builders' Merchants.

WM. E. PECK & CO. (Inc.), 31 Bartholomew Close, London, E.C.

Digitized by Google

Light and Coke Company. The aggregate length of the four bridges is about one mile, the widths of the roadways varying from 45 to 70 feet. An experimental three-burner inverted "Keith" high-pressure lamp has been fixed in Fleet Street, consuming the same amount of gas as the single burner, and gives, it is stated, a like illumination, viz., 1,500, but with a better diffusion. Its improvement is, that if one mantle breaks, the remaining two will give a good light until a new mantle is put on, instead of the lamp being out. The annual cost of the lamp would be the same as the single burner. In Queen Victoria Street, an experimental four-burner "Keith" high-pressure inverted lamp has been fixed in one of the existing high-pressure lanterns in place of the two upright burners. The consumption of the four burners is the same as the upright burners, viz., 20 cubic feet per hour. It is claimed that the candle power is increased about 50 per cent., viz., 45 instead of 30 candles per cubic foot of gas, giving a total of 900 instead of 600 candles. The maintenance cost would be the same.

The "Keith" Lamp.—For the purpose of comparison, the "Keith" inverted lamp gives sixty candles per foot of gas consumed, against fifty-one to fifty-three and a half candles and 25 feet consumption against 28 feet of the "Graetzin," therefore "Keith" single burner 25 feet per hour at sixty candles per foot as tested on photometer, equals 1,500 candles. "Graetzin" single burner 28 feet per hour at fifty-one to fifty-three and a half candles per foot, as claimed by Berlin figures, equals 1,400 to 1,500 candles. A specimen of the newest form of "Graetzin" lamp with three burners has also been fixed in Fleet Street on the existing compressing plant, giving an illuminating value of about 4,400 to 4,555 candles with a consumption of about 84 cubic feet of gas per hour.

Incandescent Gas Lighting—Low-pressure.—The number of gas lamps, principally single burners of the upright type, at the end of the year 1908 was 2,640—each consuming 4¼ cubic feet of gas per hour, the illuminating power being sixty-five to seventy candles. Owing to the narrowness of the side streets the lamps are nearly all fixed on brackets about 60 feet to 70 feet apart, at a height of about 12 feet from roadway to burner, the annual cost of each lamp with gas at 2*s.* 5*d.* per 1,000 cubic feet being 3*l.* 10*s.* 2*d.* This cost includes maintenance of mantles, &c., but does not cover capital charges. A few two, three and five burner lamps are fixed upon standards on the rests in the main roads and squares.

Low-pressure Inverted.—The only low-pressure inverted gas lamps in the City are a few "Carpenter" one and two-burner lamps on trial, with a stated consumption of 4 and 8 cubic feet per hour, and 100 and 200 candle power respectively, being a claimed efficiency of twenty-five candles to the foot of gas consumed. The price of gas for public lighting up to Midsummer was 2*s.* 5*d.* per 1,000 cubic feet, but this amount was then reduced by 1*d.*, and a further reduction of 2*d.* per 1,000 cubic feet will be made as from January 1, 1910, when the Gas Light and Coke Company will reduce the illuminating value of their gas from sixteen to fourteen candles, under their Bill now before Parliament, which has passed the third reading of the House of Commons. The effect of these reductions will be to decrease the annual cost of the newest type of high-pressure inverted gas lamp, as in Fleet Street, from 16*l.* 10*s.* to 15*l.* 2*s.* 6*d.*, and all other gas lamps proportionately.

MR. HARRY COCKSHUT, of Edinburgh House, Brondesbury, N.W., a director of the Wallpaper Manufacturers, Ltd., left estate of the gross value of 133,776*l.*, of which the net personalty has been sworn at 119,367*l.*

THE Swansea painters' strike terminated last Friday, and 200 men, who have been out for several days, will resume work immediately. The men decided to accept the offer made at the meeting of the employers to have the matter in dispute arbitrated upon by the Board of Trade. The Swansea plasterers' strike, which has lasted nearly twelve weeks, continues.

PLANS have been passed by the Windsor Town Council for a new theatre and opera house at Windsor, which will be erected on the site of the old building which was burned out a year or so ago. The new theatre will seat over 1,000 persons, and will cost about 20,000*l.* The money is being found by a local syndicate. It is expected that the new theatre will be ready for opening by the end of January. The plans are by Mr. Harry St. J. L. Percival, architect and surveyor, 47 Mortimer Street, Cavendish Square, W.

The H.H. CLOSET
is a complete novelty, being designed on common-sense principles. A perfect flush.

The H.H. GULLY
dispenses with trap inside house and is cleaned at every flush.

The H.H. GREASE TRAP
Self-cleansing; can contain no unpleasant sediment; does away with lead sink trap, which is always filthy.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

WOLVERHAMPTON.—Aug. 13.—For restoration and preservation of the decayed stonework at the Art Gallery and School of Art off Lichfield Street. The Borough Engineer's Office.

WREXHAM.—Aug. 24.—For the construction of a convenience on land off Town Hill, and also the removal from Brook Street of an iron convenience and its re-erection in Tenter's Square. Separate tenders. Mr. John England, borough engineer, Willow Road, Wrexham.

YARMOUTH, ISLE OF WIGHT.—Aug. 16.—For repairs to the pier, for the Town Trust, Yarmouth, I.W. Messrs. Newman & Cocks, surveyors, Ryde.

AT the last meeting of the Fenny Stratford Urban Council, Mr. Chadwick, engineer for the proposed Sand House water supply scheme, brought up a report, and said the cost of the scheme was estimated at 11,644*l.*, or, with fees and contingencies, about 12,000*l.* This sum was made up as to the larger items of—cost of boring and well 3,000*l.*, land 1,200*l.*, mains 3,000*l.*, reservoir 2,700*l.*, house and machinery 1,500*l.* It was agreed that the Clerk seek an interview with the Local Government Board authorities and arrange for a local inquiry to be held as soon as possible.

JUDGE DODD, sitting in Hull county court last week, complained of the ventilation of the court-room, and ordered an official to smash a window, which was done. The Corporation's property committee, having considered his Honour's action, have adopted the following resolution:—"That this committee, having the control of the property of the Corporation, strongly protests against and resents the high-handed and unwarrantable action of his Honour Judge Dodd in causing the window of the County Court to be broken on July 27, on the plea of obtaining additional ventilation, and considers that if the ventilating apparatus of the court was found defective or insufficient a report to that effect should have been made to the Council as the owners of the building; also that a copy of this resolution be forwarded to his Honour Judge Dodd."

TENDERS.

TRADE NOTES.

The new Nurses' Home at the Royal Alexandra Infirmary, Paisley, erected from the plans of Mr. T. Graham Abercrombie, Paisley, has been ventilated by means of Mackay's patent direct-acting ventilators, supplied by Cousland & Mackay, Glasgow, the sole makers.

Messrs. J. B. Joyce & Co., Whitchurch, Salop, have been favoured with the order for a very large clock for the head offices of the Refuge Assurance Company, Oxford Street, Manchester. It will show time upon four dials, each 12½ feet diameter, of a special design, and will be illuminated at night. The clock will contain all the best and most modern improvements.

VARIETIES.

Littlehampton has decided to embark on a drainage scheme which will cost 15,000*l*. The Duke of Norfolk will contribute 4,000*l*. of that amount. The question has been under consideration for very many years.

At a Local Government Board inquiry in Sheffield last week the Corporation sought permission to borrow 8,538*l*. for sewerage works. It was stated that the amount would cover the reconstruction of about two and a half miles of rubble sewers in eighteen streets. In all fifty-three miles of these sewers have been abolished since 1898, and there are still sixty-six miles to convert.

The Staffordshire education committee have considered a question raised by the county medical officer as to the necessity of all windows in public elementary schools being made to open, and it was ultimately resolved that the architect be instructed to make provision in all future plans for sash windows to be constructed in school and class rooms, drill halls and corridors, so that every part may be opened. At the same meeting last week the architect's sketch plans for Wordsley, Lawnswood Road, proposed Council school were adopted, showing provision for 250 girls and 268 infants.

At the meeting of the London County Council on the 27th ult., there appeared upon the agenda paper a recommendation of the main drainage committee to the effect that the tender of Messrs. Shellabear & Son, Plymouth, amounting to 473,416*l*. for the construction of the southern low-level sewer from Deptford to Battersea be accepted. The Chairman of the committee (Mr. Easton), however, stated that the tender had been withdrawn, the reason given being that the contractor could not place his orders for cast-iron at the price anticipated. The estimate of the chief engineer in respect of the work was 480,000*l*., and it was urged by the Progressives that the work should be carried out by direct labour. On a division the committee's recommendations were referred back for reconsideration.

The borough accountant of South Shields has issued a financial statement with regard to the new municipal buildings. It shows that the expenditure up to the present time has been 49,727*l*. 5*s*. 5*d*. In addition there are estimated liabilities to be met, including 4,943*l*. to the contractors, 2,029*l*. for authorised extras, 1,773*l*. 17*s*. 3*d*. for day accounts claimed by the contractors, 4,300*l*. for furnishing, 4,000*l*. for laying out the forecourt, 850*l*. architects' commission, and other items making a total of 18,245*l*. 7*s*. 3*d*. A sum of 2,026*l*. 17*s*. 4*d*. is set down for contingencies which will make the total estimated cost 70,000*l*. As the council's borrowing powers for the buildings are only 60,000*l*., it is proposed to apply for additional powers to the extent of 10,000*l*., the sum by which the original amount has been exceeded.

The paving and highways committee of the Manchester Corporation in their annual report refer to an experiment they are making in some of the streets of the more thickly populated parts of the city. In certain streets in Ancoats, for example, the sett paving has been removed, and the carriage ways reformed and paved with granited rock asphalt laid on a concrete foundation. This gives a smooth and unbroken surface, from which liquids fall away at once to the gullies, and enable the pavements to be more easily swept and kept clean and sanitary. It is hoped that this type of carriageway pavement will be successful and suitable for the class of street in which it has been laid, and, if found so, further streets will probably be dealt with in a similar manner in the future. Then, with the increased use of motor vehicles and the consequent heavier loads carried and at higher speeds, stronger pavements have become necessary, and in consequence, during the year granite setts have been substituted for grit setts, &c., in fourteen streets.

The Comisión Provincial de Orense invite tenders for the construction of a provincial infirmary at Orense, Spain. The upset price is placed at 823,000 pesetas (about 29,400*l*.), 5 per cent. of which amount must be deposited provisionally to qualify any tender, to be increased to 10 per cent. by the successful tenderer, who will also be required to pay to the architect, Don Joaquin Rogi, the sum of 23,100 pesetas (about 800*l*.) by way of compensation for preparing the plans, and a further percentage for inspection during building operations. Tenders will, says the *Board of Trade Journal*, be opened on August 20, both at the Comisión Provincial de Orense, Orense, and at the Dirección General de Administración, Ministerio de la Gobernación, Madrid, to either of which addresses tenders in sealed envelopes should accordingly be sent. Local representation is necessary.

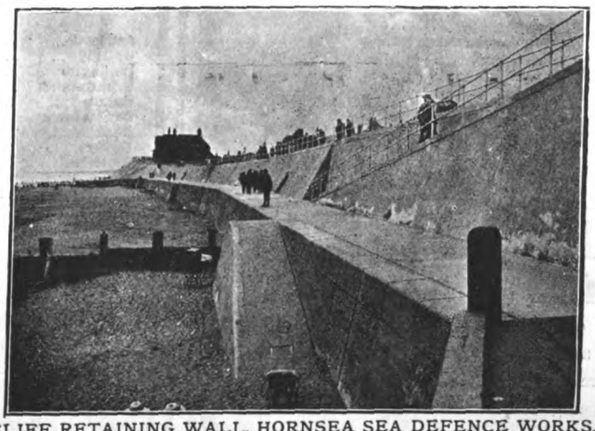
A URALITE PAVILION.

One of the useful as well as ornamental pavilions at the White City, Shepherd's Bush, is here illustrated. This Uralite Pavilion stands outside the Machinery Hall and can be seen from the cars which circle the grounds. Among its most striking features is the roof, which is covered with Asbestone 12 inches by 12 inches diagonal tiles. These tiles are neat in appearance, and are light, strong, durable, and cheap. It may be mentioned that the British Uralite Co. (1908), Ltd., who have put up the pavilion, have just completed delivery of 200,000 of these tiles for a large railway company in the Argentine. Asbestone is made also into sheets, 6 feet by 3 feet, for walls and partitions. The building admirably shows the adaptability of the British Uralite Co.'s manufactures for the construction of bungalows, &c. The walls are of coloured Asbestone sheets, nailed direct to the wood framework; the ceiling is constructed of Uralite sheets, part fixed direct to ceiling joists to form a plain flat ceiling, and the remainder fixed above the ceiling joists, thus obtaining the effect of an old-fashioned timbered ceiling. The roof is laid, as already stated, with Asbestone diagonal tiles on battens, with the exception of the dormer, which is covered with 12 inches by 8 inches Asbestone slates.



THE PAYMENT OF ARCHITECTS.

There are some useful lessons to be learnt from the case of Brown *v.* R. Mickel & Co., tried before Mr. Muir Mackenzie, the Official Referee, who gave judgment on July 31.

In this action Mr. D. Brown, an architect, of Baptist Church House, Southampton Row, London, sued Messrs. R. Mickel & Co., contractors, of Portland Court, Great Portland Street, London, and also of Glasgow, from whom he claimed 6,926*l.* 19*s.* 6*d.* balance alleged to be due in regard to professional services rendered in connection with the erection of a large block of flats in Portland Street, London. The defendants had paid 1,000*l.* into court, and counterclaimed for damages, alleging delay and negligence on the part of the plaintiff in connection with the work.

The Official Referee, in giving judgment, said that the real question in dispute was as to whether the plaintiff became entitled to a payment of 9,426*l.* 19*s.* as remuneration for his services as architect for the building of a large block of flats in Portland Street. The plaintiff had been paid, during the construction of the flats, 2,500*l.*, on account of his remuneration, and the present claim was for the balance. The defendants denied that the plaintiff in the circumstances was entitled to any remuneration in excess of 2,500*l.*, and had brought a counterclaim alleging negligence by the defendant in his duties as architect. They had also paid 1,000*l.* into court. Since the compromise, continued the Official Referee, of an action brought by the defendants against the plaintiff in May, 1907, the plaintiff had done nothing towards the supervision of a remainder of the buildings—which were ultimately completed—so far as the architectural work and supervision were concerned. Late in 1908 the plaintiff put forward his claim against the defendants. He had already received 2,500*l.*, but the claim he put forward was for 5 per cent. on the estimated

cost of the building, 1,945*l.* 19*s.* 6*d.* for extra work, and 231*l.* for out-of-pocket expenses. It was significant that the work as described was not only the work of an architect, but also that of a surveyor, and the employment was to be as architect and surveyor for the purpose of the building. A great part of the work of the designing and planning had been done. It, therefore, appeared to him that in the circumstances the work was to be practically the whole of the work appertaining to an architect, and which would include various things which might be reasonably contemplated as having to be done. An architect, like everybody else, continued the Official Referee, could not recover for what was generally called "extra work" unless he made a contract by which he was to be paid for it, or unless the work was ordered and done in such circumstances that a contract to remunerate him for it, beyond what he had received in the ordinary course, could be employed. The plaintiff had not completed the work. Whether that were or were not his fault Mr. Mackenzie did not think it necessary to find. If it were his fault, he would be disentitled to further remuneration, but that ground had not been suggested by the defendants. The defendants suggested that plaintiff was to be paid remuneration of 5 per cent. on the cost of the work up to the time he ceased to do it, and that appeared to him to be the correct contention. Regarding the counterclaim, the defendants had alleged that the plaintiff had delayed unreasonably the preparation of the plans for the steelwork by which it was delayed. He (the Official Referee) thought there had been some delay, and delay which there should not have been; but he could not find, having regard to all the other matters going on, that that particular delay had caused the defendants any pecuniary loss which he could assess. It had been alleged, too, that there was neglect by the plaintiff as regarded certain plans. He confessed he did not think much of that particular claim, and he did not consider that under the circumstances the defendants would require any pecuniary indemnity in respect of the matter of complaint. On the whole, he thought that the fair decision to arrive at would be that the 1,000*l.* paid into court by the defendants was a fair and reasonable further remuneration to pay to the plaintiff, and that the latter was not entitled to anything more. There would, therefore, be judgment for the defendants in the action, because they had succeeded on the issue going to the whole cause of action. He ordered that the 1,000*l.* paid into court by the defendants should be paid out to the plaintiff. The defendants would have the general costs of the action and counterclaim after the date of the payment into court. The plaintiff would have his costs of action up to the date of the payment into court. The two sets of court would be set off one against the other.

CONTINENTAL TOWN PLANNING.

The official report of the Continental Town Planning Tour, arranged by the National Housing Reform Council for last Easter has now been published, and we give the following abstract as summarising the results of the tour:—

Coming to the lessons of the tour, it may be said that "Germany for town planning, England for cottages," will probably be the verdict of the majority of the members of the party in regard to the lessons of the tour.

Two sets of workmen's dwellings were visited—at Düsseldorf and Frankfort respectively. These dwellings are well designed and without doubt reach the high-water mark of German endeavour to provide dwellings for workmen on the tenement system. The building cost per room is, however, quite 50 per cent. greater than that of rooms in the English cottage, and as a result the rents charged per room compare unfavourably with those charged in English cities of a similar size to Düsseldorf and Frankfort. The building regulations as to thickness of walls seem unnecessarily severe, even when the greater rigour of a mid-European winter is taken into account; and the members of the party learned with interest of a strong movement in favour of the relaxation of building construction by-laws. At Düsseldorf the cost of land for the dwellings of the admirably organised Düsseldorf Spa-und-Bauverein was 17*s.* 6*d.* per square metre, and this was considered cheap. The cost of making streets (including canalisation) 6*l.* per metre frontage, and the building cost per room varies from 86*l.* to 91*l.*

The cost of land was found to be very heavy on the borders of all the cities visited, and this fact called for

special inquiry and discussion. It was found that during the past thirty years the great facilities given for the sale and purchase of land, the cheapness of methods of transfer and mortgage, &c., had resulted in much land speculation, and a great inflation of land values. Endeavours had been made to check this speculation, but so far with only partial success. Many towns had adopted a system of taxing increments in land values whenever sales of land took place.

The willingness of the German people, rich and poor alike, to live in block dwellings had rendered it possible for owners of building sites to demand far higher prices for land needed for housing purposes than could possibly be obtained in Great Britain.

The value of municipal ownership of land as a means of increasing municipal revenue seems to be recognised on all hands in Germany. The most striking example of this was found at Frankfort. The enterprising Municipal Council of this city expended 1,200,000*l.* on the purchase of an enormous area of land on the east side of the city, and then proceeded to carefully plan and thoroughly carry out not only a scheme for a new river harbour, but for what is practically a new industrial town, with factory sites, proper railway communication, public parks, and workmen's cottages.

The special lesson of the tour is without doubt exemplified in this wonderful Frankfort example of municipal foresight. The first and last word in municipal administration in Germany would seem to be "thorough." In the preparation of a town plan no detail seems to be forgotten. If the prevailing winds are from the west, then the factories are placed on the eastern side of the town. Special care is given to the modern equivalents of the old city gates, the central railway stations. These are, without exception, imposing structures, and not, as in so many cases in England, unlovely aggregations of grimy buildings approached through a series of squalid streets. Money is spent lavishly on open spaces and public parks. The art of architecture is deliberately encouraged, and the consequent rivalry among architects has already produced many styles of architecture which, though possibly belonging only to a transition period, bear witness to the keen determination to produce new developments.

It is possible that in the desire to give special attention to what may be called town planning of the monumental kind, German town planners have gone to extremes. That this is so was clearly shown in the address given by Beigordneter Rehorst at Cologne. A new school of town planning experts is, however, being gradually developed, and many of the faults of the earlier methods are being corrected.

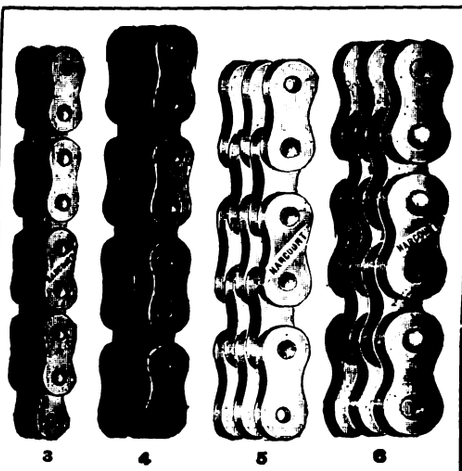
The enthusiasm for municipal progress and the absolute belief in a great municipal future which animates German officials and councillors, provide both an inspiration and an example for British councillors and officials.

The task confronting housing reformers in Great Britain is a great one, but given the same spirit of municipal enthusiasm and the same belief in the future of our centres of national life, then the task can be accomplished.

Our town planning developments will without doubt differ in one vital matter from the town planning developments of Germany. The unit of our planning will be the cottage with its home garden, and not the block with its central playground. It may well be that we shall in this way combine the best that England can show, and thus render our German neighbours a service in return. Meanwhile we owe them a deep debt of municipal gratitude for many striking examples of civic earnestness and enthusiasm.

In September, 1909, a second Continental Town Planning Tour will be made, under the auspices of the Council. Four towns will be visited. These will include Ulm-on-the Danube and Munich. It is hoped that a French city will be included in the tour.

Membership of the party will, as in the case of the Easter tour, be limited to municipal councillors and officials, architects and surveyors, and members of the National Housing Reform Council.



Further particulars of this tour will be sent to local authorities, and can be obtained on application to the Secretary, 18 Dulverton Road, Leicester.

THE Liverpool City Council have by fifty-three votes to twenty-seven rejected the housing committee's proposal to provide a municipal common lodging house for women at a capital expenditure of not exceeding 3,500*l.*, and an annual cost of maintenance of not exceeding 500*l.*

BUILDERS' BENEVOLENT INSTITUTION.

The sixty-second annual general meeting of the Builders' Benevolent Institution was held at 31 and 32 Bedford Street, Strand, W.C., on Monday, July 26. The minutes of last annual meeting were read and approved; the appended annual report, the audited accounts, and the amended rules were read and approved. The following elections were made:—President, Mr. Howell J. Williams, J.P., L.C.C.; treasurer, Mr. J. Howard Colls; committee, re-elected: Mr. C. Ansell, Mr. W. Brass, Mr. T. Hall, Mr. B. Hannen, Mr. H. Arthur Bartlett, Mr. H. Holloway, J.P., Mr. J. Randall, Mr. W. Shepherd, Mr. T. Stirling; elected: Mr. J. W. Lorden, Mr. F. G. Rice, Mr. J. C. Nicholson. Votes of thanks were given to Mr. J. W. Lorden for his services as president during the past year, also to the hon. auditors (Mr. J. T. Bolding and Mr. R. J. Ward, F.C.A.), the trustees, vice-presidents, committee and dinner stewards.

The following was the amended report:—

The committee beg to submit their sixty-second annual report, and deeply regret that in consequence of the continued depression in the building and allied trades the funds at our disposal have decreased to such an extent that we have been obliged to sell out 500*l.* of stock to meet liabilities in the past year. The committee earnestly appeal for assistance in order to make provision for the many claims upon this charity.

We desire to register our hearty vote of thanks to Mrs. Richardson for her kind gift of 857*l.* in memory of her deceased husband. The money has been invested in the purchase of London and South-Western Railway Company Stock and the proceeds will be devoted to paying a female pensioner, approved by the committee, and nominated by Mrs. Richardson.

Attention is directed to the fact that the greatest economy is exercised in keeping down the administrative expenses. During the year three additions have been made to the pensioners' list, which now consists of twenty-nine men and twenty-seven women. Five male and five female pensioners have died during the last twelve months; the widows of the deceased male pensioners have been placed on the list after careful investigation of their claims. The committee desire to thank Mr. J. W. Lorden for his valuable services and kind contribution as president. Also the trustees (Mr. F. J. Dove, Sir Arthur C. Lucas, Bart., Mr. T. F. Rider, Mr. J. Howard Colls, Mr. T. Stirling and Mr. J. T. Bolding), the honorary auditors (Mr. J. T. Bolding and Mr. R. J. Ward, F.C.A.), and the dinner stewards.

Mr. Howell J. Williams, J.P., L.C.C., has kindly accepted the presidency for the coming year.

The annual dinner will be held on Thursday, November 25, 1909.

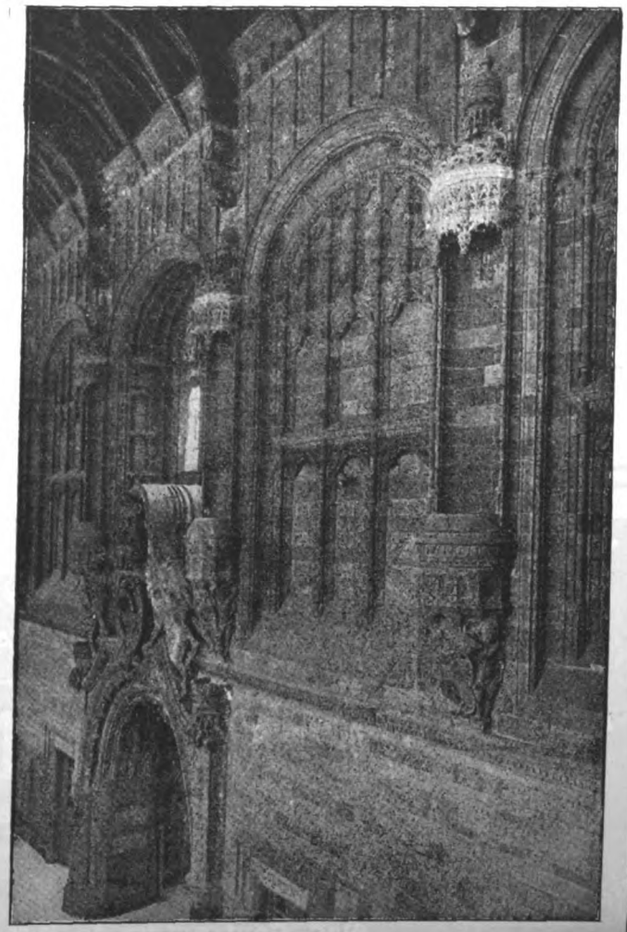
CANTON.

The city of Canton is the capital of the most southerly and also one of the largest and most densely populated provinces in China. The inhabitants number at a moderate estimate over 1,250,000 inhabitants, and are probably the wealthiest of any in the great cities of China. They are famous for their enterprise and business capacity, have spread all over the empire, and are to be found playing a leading part in all the Chinese communities of America, Australia and the Malay Peninsula. They have placed themselves in the van of the movement towards reform and constitutional government.

The Acting Consul-General, in his annual report, mentions many interesting facts about the development of the city.

Canton, after Peking the most famous of all the great cities of China, is contained within walls some six miles in circumference, and has extra mural suburbs—which form the chief business quarters of the city—stretching nearly five miles along the river bank.

Immediately adjacent to the south-western suburb of Canton lies the foreign settlement of Shameen, a small island not more than one and a quarter miles in circumference, which western enterprise, mainly British and French, has converted from an erstwhile barren mud flat into a miniature township, with rows of substantial residential and business buildings, intersected by shady avenues and public gardens and recreation grounds. The island is leased to the British and French Governments in perpetuity, two-thirds of the area being under British and one-third under French control.



The number of foreign residents, which until ten years ago remained stationary at between 300 and 350, had in-

creased in April 1909 to close on 1,350. The total foreign population of Canton is probably over 1,500.

But few lots on either concession now remain unbuilt on, and the value of land and house property has risen to such an extent that a lot on the British concession, measuring 12,645 square feet, which changed hands in 1885 for some 4,000 dols., was recently sold by public auction for 37,800 dols. (3,150*l.*). This works out to, say, 5*s.* per square foot.

It is dangerous to prophesy in the East, but everything seems to point to Shameen becoming more and more the business centre of Canton.

Among the more recently established factories and undertakings making use of labour-saving machinery, the following are commended to the notice of British manufacturers:—

The Canton Government Cement Works.—Built at a cost of 300,000 dols. Machinery, consisting of a main steam engine with three boilers (500 horse-power), elevators, grinding machines, drying plant, crushing machinery, &c., supplied at an additional cost of 320,000 dols.; estimated output per diem, 500 barrels of 400 lb. net each. These works are now in operation under German supervision, the management being Chinese. With special facilities for obtaining cheap limestone and cheap labour, and a growing demand for cement on railways and other works, they should, if capably managed, prove a paying concern.

Canton Waterworks.—These waterworks, built at a cost of 1,500,000 dols., under the supervision of a British engineer, were opened in August 1908. The machinery, all of British manufacture, is capable of supplying 6,000,000 gallons of water every twenty-four hours. The water, taken from the river a few miles above Canton, appears to be of good quality, and already some forty miles of piping have been laid down in the city and suburbs, from which water is supplied to over 10,000 subscribers. The waterworks are under Chinese management, no foreigners being employed.

Canton Electric Light Works.—These works, erected by the Chinese Light and Power Company of Hong-Kong, are situated at the South Gate. The plant is up to date in every detail, and, with the exception of an engine, is of British manufacture. It consists of three Diesel oil engines burning crude petroleum, the total brake-horse-power being 600; five steam engines, of a total brake-horse-power of 730; four Babcock-Wilcox water-tube boilers, burning Japanese coal; and one Green's economiser. Induced draught is used, Contraflo and Worthington condensers. The staff consists of two engineers, one mains superintendent, and 121 Chinese. Electric energy is supplied to Canton city and the foreign settlement of Shameen by means of overhead high-pressure mains, carried on iron and wooden poles. The primary pressure is 2,000 volts. The secondary or house-service pressure is 100 volts. The current is alternating. The supply on Shameen is continuous, that in the city being from sunset to sunrise.

Total number of eight-candle-power (equivalent) lamps connected (March 1, 1909), 26,510.

The British Consul remarks that lest any British firm should take the trouble to send out illustrated catalogues and circulars and make inquiries with regard to the openings for machinery above indicated, he would repeat that catalogues, more especially of railway material, are useless, and that the only way to obtain orders is to follow the German and American example and send out competent men, who will find out exactly what the Chinese want, tell them exactly what they can supply and for how much, and in short be prepared to exercise that patience, tact and business acumen without which in these days big orders are not obtained in China. British manufacturers are too often content to be represented by merchants in China, who, however willing they may be to push their wares, have not the time to devote to the business and are without the necessary expert knowledge. He is convinced that it is for this reason that so many large orders for railway material have, during the past year, gone to German and American firms.

Mr. William Plant, chief engineering assistant to the borough engineer and surveyor of Leicester, has been appointed borough engineer and surveyor at Stafford, at a salary of 275*l.* a year, rising by annual increments of 25*l.* to 400*l.* Mr. Plant was formerly engaged in the office of the borough surveyor of Stafford, Mr. Blackshaw, who is retiring after many years' service.

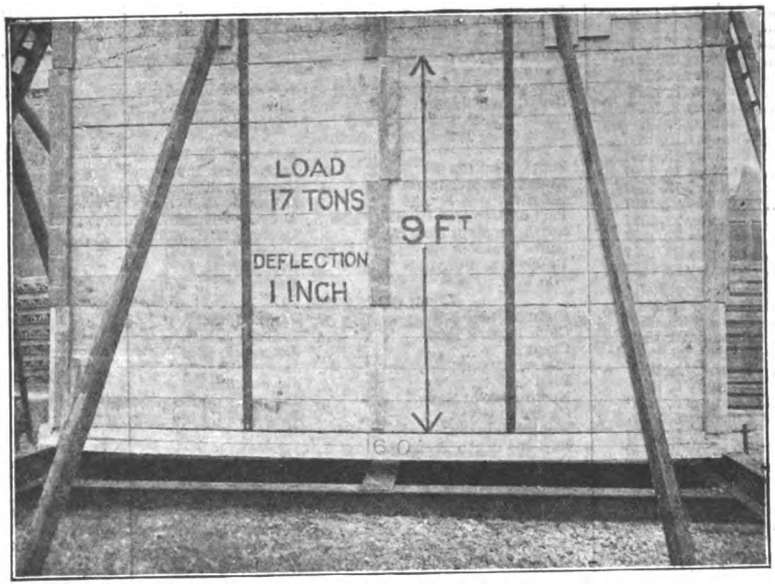
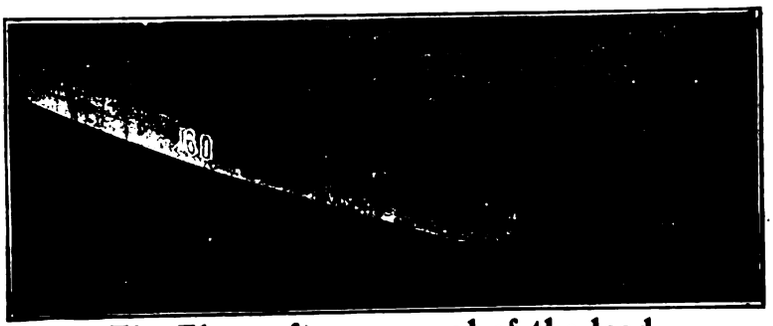
FAWCETT'S MON'LITHCRETE



STEEL GIRDERS

are lattice girders minus compression web members, and in combination with concrete are more than double the strength of joists of equal weight.



For prices per ton and for estimates apply:—

Fawcett Construction Co., Ltd.,

Tunnel Avenue, East Greenwich.

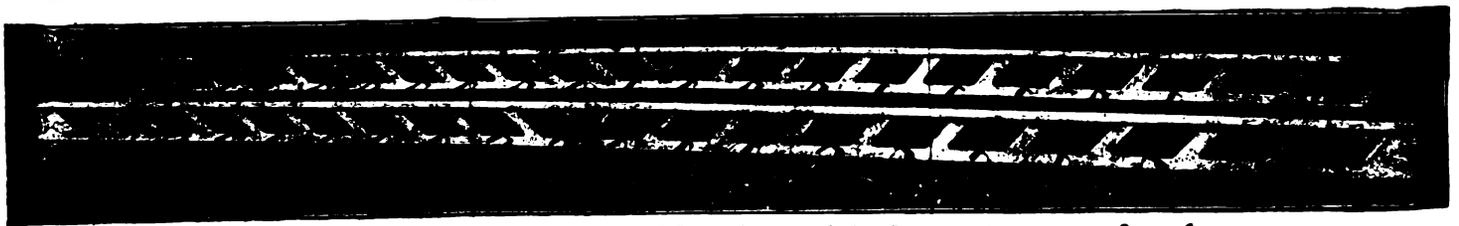
14 cwts. per foot super. on Mon'lithcrete Floor.

The Floor after removal of the load.

Distributed Load in cwts. that one foot will carry at one-fourth the breaking weight—

(63)

Divide by the span in feet and by the working load in cwts. to find the Spacing in Feet.



EXAMPLE.

Span 15 Feet.

Load 1½ cwts. per foot.

15)63·0(4·2

120

Or about 2′ 9″ to 2′ 10″ Centres.

Mon'lithcrete Girders in combination with Concrete are safer than Reinforcing Bars.

"The general results of the tests must certainly be considered as highly satisfactory, and as substantiating the claims put forward on behalf of this method of floor construction in respect of strength and rigidity."—THE BUILDER, February 20, 1909.

"It is claimed for this system of construction that it provides the same safeguard against the expansion of concrete as does the use of reinforcing bars, and this seems to be a justifiable claim, considering how perfectly the concrete is held by passing through the webs of the joists."—THE BUILDING NEWS, February 12, 1909.

"The aim of the inventor, Mr. Mark Fawcett, has been to obtain monolithic construction not by using concrete reinforced by bars and loose or fixed stirrups, but by using what might be described as lattice girders from which the compression members have been removed; in other words, rolled steel girders with large rhomboidal-shaped openings in the webs and tension bars pitched at an angle of 45° to the right and left of the centre, leaving the webs solid at each end to resist shear, whilst the top flanges are reduced to two-thirds the sectional area of the bottom flanges.

"The result is that the steel beams, reduced in weight 40 per cent. from the British standard, are capable of carrying at least 50 per cent. more load. The new floor has besides the advantage that an aggregate, as broken brick, can be used for the concrete, possessing greater resistance to fire and less conductive of sound than ballast concrete ordinarily employed in reinforced work."—THE ARCHITECT, February 26, 1909.

Mon'lithcrete Girders have known strength like ordinary steel joists.

Printed by SPOTTISWOODE & CO. LTD., at No. 5 New-street Square, E.C., and Published for the Proprietors by P. A. GILBERT WOOD, at the Office, Imperial Buildings, Ludgate Circus, London, E.C.—*Friday, Aug. 6, 1909.*

Avoid uncertainty and worry by insisting on your Concrete being reinforced with

The PERFECTOR TRUSSED BAR

the only Bar which has the correct number of Shear Members irremovably attached.

The Bar is so firmly anchored at so many points that it is impossible to stress the Steel sufficiently to destroy the adhesion of the Concrete, consequently all the ideal advantages of Reinforced Concrete are preserved.

The only system which is proof against the carelessness of workmen.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

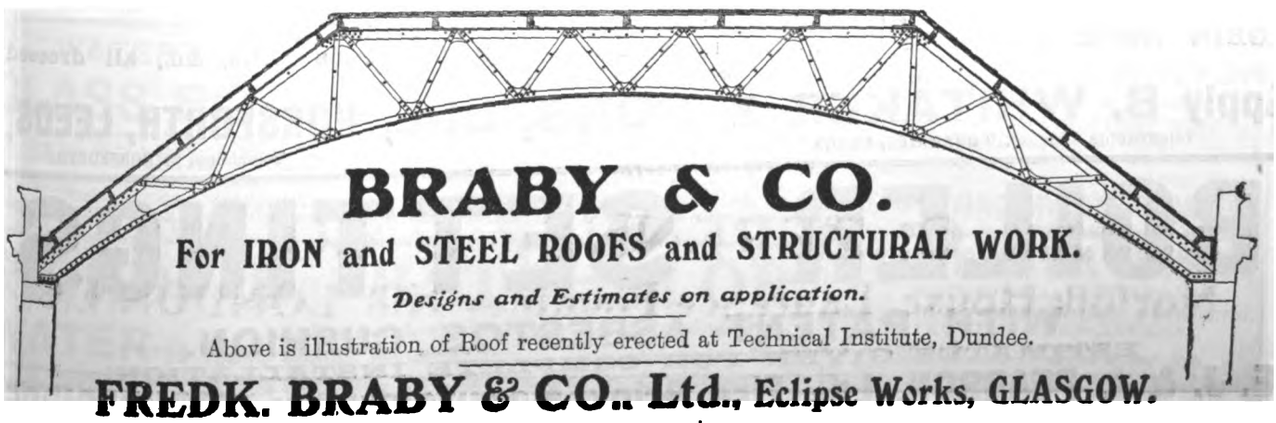
Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

ANSWERS TO LEGAL QUERIES.



RECEIPT WITHOUT PREJUDICE (R.J.J.).—Your question is one of fact rather than of law. You have certainly not been treated fairly in accordance with the terms of the contract under which you have a clear claim for the full amount. Your letter of the 12th instant is somewhat ambiguous, but if you sued for the arrears due to you the Court would probably construe the letter in your favour, having regard to the circumstances of the case.

COMPETITIONS OPEN.

DEPTFORD.—Sept. 1.—The Metropolitan Borough Council of Deptford invite designs for a branch library at New Cross, S.E. Premiums of 50 guineas, 25 guineas and 10 guineas will be awarded. Assessor, Mr. J. S. Gibson, V.P.R.I.B.A. Deposit 1*l.* 1*s.* Competition is limited to architects practising in the city or county of London. Mr. Vivian Orchard, Town Clerk, Town Hall, New Cross Road, S.E.

"America's Motherland." By T. W. D. Smith. (London: T. M. Middleton & Co. 1*s.* net, or 25 cents.) Protests have been raised from time to time against the suicidal frankness which puts valuable information concerning this country at the disposal of those who might some day, and that no very distant one, use it against Great Britain. Commercial rivalry is now so keen that too much care cannot be taken not to allow competitors any unreciprocated facilities for learning the secret details of trade. Again, there seems to be no doubt that foreign nations have opportunities for minutely planning an armed invasion of this country such as are offered nowhere else. Indeed, we have reason to believe that foreign officers know certain parts of the coast and certain counties far more intimately than they are known to ourselves. But there is one invasion which brings nothing but pleasure—viz., that successfully carried out by the American tourists. Though here also it must be acknowledged with humiliation that the *soi-disant* stranger usually comes with (and certainly leaves with) a more precise idea of what Great Britain has to offer than is possessed by the majority of its inhabitants at the present day. "America's Motherland" is the title of a concise guide for American visitors to England which has been published under the auspices of the Great Central Railway Company. Out of the 250 pages a little more than 100 are devoted to London, and in them the information is bright and pithy, thoroughly up-to-date, and is illustrated by photographs, so as to prevent the visitor forgetting altogether what he saw. There must be many omissions in a handbook where whole-page photographs and advertisements are sandwiched among the letterpress; but we are surprised to find that not a word is said about Trafalgar Square, with its Nelson Column—surely a prominent feature in the historical topography of the metropolis! The view of the latter is scarcely adequate. However, London is, after all, only an incident in a tour in England. The provinces must call for equal notice. A chapter has been contributed by Mr. Clement Shorter, entitled "In a Land of Famous Men," while that on "The Home of Shakespeare" is written and signed by Marie Corelli. This latter would alone make the booklet attractive, more especially as the final photograph is of "Mason Croft, Stratford-on-Avon. The Home of Miss Marie Corelli." There are finally mentioned about ten other places of personal or historic interest. The book will provide purchasers on their return with an agreeable memento of what was seen in America's Motherland.

The Berkshire County Council have been informed, in connection with the competition for the proposed new county offices at Reading, that after considerable negotiations with the Royal Institute of British Architects, paragraph 1 of the printed conditions has been approved in such a form that when the assessor has selected the three best designs two members of the Council will join him in making the final selection of the architect, but the Council do not bind themselves to carry out any one of the designs submitted. The Chairman and Vice-Chairman of the Council have been appointed to act in conjunction with the assessor.

VARIETIES.

Mr. F. W. Pomeroy has been commissioned to execute a memorial statue in Liverpool of the late Earl of Derby.

Walsall Corporation gas committee have decided to recommend an extension of the area of supply to include Pelsall and High Heath, at an estimated cost of 3,365*l.*

The Rotherham Rural Council have received the sanction of the Local Government Board to borrow 4,050*l.* for sewage works at Dalton and Thrybergh.

The Mayor of Ludlow has announced that to signalise his tenure of office he will present a drinking-fountain to the town.

The vicar and churchwardens of St. Mark's, Old Street, London, have received 500*l.* from Sutton's Trustees as payment to the church of compensation in regard to interference with ancient lights. The money is to be expended on repairs and alterations.

The road from Keswick to Seatoller past Lodore Falls and through Borrowdale Valley in the Lake District is to be made 18 feet wide, at a cost of 6,600*l.*, by the Cockermouth Rural District Council. The Cumberland County Council grants 2,500*l.* towards the scheme and will afterwards take the road over.

The Arts and Crafts Exhibition Society (Mr. Walter Crane, president), which was founded in 1888, will open its ninth show of contemporary work in design and handicraft (limited to the last twenty years, and not having been previously shown in London) at the New Gallery on January 8. The receiving day will be December 28.

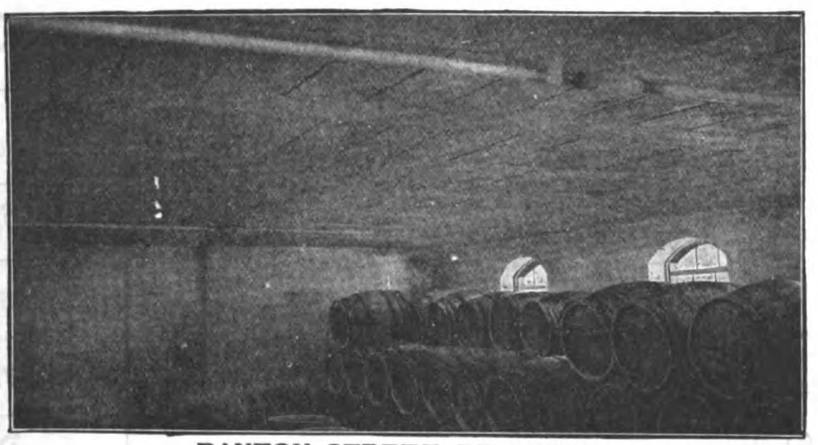
The Grimsby Borough Engineer (Mr. H. Gilbert Whyatt, A.M.I.C.E.) reported to the finance committee on the 4th instant that fifty-one designs had been received from fifty architects in connection with the competition for the extension of the town hall. After some discussion the finance committee, by a small majority, decided to submit them at once to the Assessor (Sir W. Alfred Gelder, F.R.I.B.A., of Hull). We understand his report may be expected in about five weeks.

A report from Messrs. Crouch & Hogg, civil engineers, Glasgow, is to be obtained by Dundee district committee with reference to Pitairlie bridge. There are three schemes proposed. The first is to deviate the road, which would cost 2,400*l.*; second to build a girder bridge at an estimated expenditure of 1,400*l.*; and third, to repair the bridge, which would involve an outlay of about 1,400*l.*

At a Consistory Court at St. Paul's Cathedral, Chancellor Tristram sanctioned an agreement that bells at the new church of St. Jude-on-the-Hill, which it is proposed to erect in the centre of the Hampstead Garden Suburb, shall not be rung before 7.55 a.m., or for more than five minutes before any service. It was stated that most of the householders in the garden suburb supported the agreement.

The Ealing Town Council has offered in exchange for three acres of allotment land at West Ealing (to be converted into a recreation ground) to give the trustees of the ground six acres in another part of the borough. Application is to be made to the Local Government Board for a loan of 4,000*l.* to carry out the necessary work. The Council has also agreed to the expenditure of 2,600*l.* on the purchase of land for the purpose of a smallpox hospital.

Mr. George Balfour, M.I.E.E., of College Hill, Cannon Street, London, intends to apply to the Board of Trade on or before December 21, 1909, for a provisional order to authorise the production, supply, and distribution of electricity in the parishes of Ballingry and Auchterderran, N.B. The Kirkcaldy district committee have granted their consent to the proposed application.



According to a return presented to the Islington Borough Council the net capital expenditure for the year 1907-8 of the fifteen electricity undertakings owned by as many Metropolitan borough councils was 5,925,009*l.*; units sold numbered 61,931,061; the average price per unit was: public, 1.71*d.*; private, 3.43*d.*; power, 1.15*d.*; total, 2.49*d.*; the average cost of production per unit was 1.20*d.*; the gross profit realised was 336,533*l.*, and consumers totalled 28,846. The capital written off amounted to 124,207*l.*, and there was transferred to reserve and other funds 30,879*l.*

The *Board of Trade Journal* announces that the *Oesterreichischer Zentral-Anzeiger* (Vienna) contains a notice to the effect that Mr. Isidor Rendes, the proprietor of the Meteor Hotel in Budapest, intends to build an hotel at the corner of Rákóci-Strasse and Csokonai-Gasse. It appears, also, that the Ritz Hotel Construction Company, of

ALLANGATE, RUSTINGTON, SUSSEX.—GARDEN FRONT—FRONT ENTRANCE GABLE—ENTRANCE FRONT.

RECTORY AND PARISH ROOM, GLYNDON, NEAR BALTIMORE, U.S.A.

Paris, have decided to build, at a cost of 2,500,000 kronen (about 104,000*l.*), an hotel, also in Budapest, on the banks of the Danube.

THE Consistory Court of London have granted a faculty to authorise the pulling down of Holy Trinity Church, Kingsway. The church was built in 1831, and in 1905 showed signs of cracking. The foundations of the church rested on sand and gravel, and in consequence of the large amount of water drawn away in connection with the construction of tube railways and other works, the building became unsafe. The Bishop of London gave instructions that the church should be pulled down and rebuilt. It is estimated that the new church would cost about 8,000*l.*

THE promoters of the forthcoming Business Exhibition at Olympia have this year decided to try the experiment of setting apart a certain amount of space which inventors will be able to use free of rent for the display of their models, products, specifications, or other material which will give the information necessary to interest possible investors who will visit the exhibition. It is not intended to include patents which have already been placed on the market, but will consist of new inventions and ideas in their rough state with the view that those which are practical may be brought to the notice of men who are able to finance them and place them on the market under the best auspices.

THE report of the directors of the Great Western Railway Company for the past half-year gives unusual prominence to schemes for the development of the company's interests in South Wales. Among the expenditures for which the sanction of the shareholders will be asked at the forthcoming meeting will be the following:—Widening portions of Monmouthshire Railway, 50,000*l.*; quadrupling line at Newport, 35,000*l.*; locomotive depot and marshalling sidings at Rogerstone, 50,000*l.*; coal tips at Swansea's new dock, 80,000*l.* These four sums represent a total estimated capital and expenditure of 215,000*l.* In addition, the company also propose during the current half-year to sink other sums in improving siding accommodation at Aberdare, Llancaiach, Pontypool Road, Port Talbot.

CONSIDERABLE damage has been done in the parishes of Minsterley and Pontesbury for many years past in times of heavy rain owing to the River Rea—which runs through the Rea Valley and joins the Severn at Shrewsbury—flooding over the land for miles. The worst section is between Horsebridge and Pontesbury, a distance of several miles. A drainage scheme has now been prepared by the Board of Agriculture. At a meeting of the committee held at Shrewsbury, a clerk and a surveyor were appointed for the first year, and instructions were given for the river to be measured and staked for the purpose of obtaining tenders for the necessary work. The river, which winds very considerably, will have to be straightened, the side drains and brooks cleaned out, the river bed deepened to a certain depth and a uniform width maintained.

UNDER the winding-up order made against the Piccadilly Hotel, Ltd., the Assistant Receiver has now issued a summary of the statement of affairs. This shows liabilities 1,906,569*l.*, of which 854,641*l.* are returned as expected to rank for dividend, and estimated assets 539,380*l.* After the payment, however, of loans on debenture bonds and other claims, there is nothing for the unsecured creditors, while in relation to the shareholders a total deficiency of 1,502,676*l.* is disclosed. The directors attribute the failure to the alterations in the plans and designs of the building insisted upon by the Crown, which they state entailed an expenditure of about 160,000*l.* in excess of the original contract price. In addition, there resulted a loss of rentals and interest of over 40,000*l.* Further, they stated that the alterations in the shops made them unsuitable for the class of shop desired in the neighbourhood, thereby decreasing the valuers' estimated annual rental value of 31,500*l.* to a present one of 10,000*l.* only.

THE National Association of Master House Painters and Decorators of England and Wales will hold their sixteenth annual convention at Sheffield from September 13 to September 18, under the presidency of Mr. James Puttrell. The meetings will begin on Monday evening, September 13, with the president's reception, when Mr. and Mrs. Puttrell

Digitized by Google

will receive the members and friends in the Exhibition Hall, Shoreham Street. The exhibition of Decorative Art and Manufactures, which is to be opened on Tuesday by Sir Wm. Richmond, R.A., K.C.B., will well sustain the interest created by previous exhibitions. This year there will be—for the first time—the work sent in for competition for the Extension prize scheme. There will also be an interesting exhibit of the studies made in Italy, by three prize-winners of the International Travelling Scholarship, Messrs. Bert Hamlyn (Bideford), Tom Stoney (Bingley), and Ivor Beaumont (Huddersfield). The sixteenth competition of apprentices' work will be held in the conference hall. The exhibition side of the convention programme will be of greater interest than usual, and the business and literary side of the convention will in nowise fall behind its predecessors. Among the most important events will be the address on September 14, by Sir Wm. Richmond, on "House Decoration for the Masses."

The Sanitary Inspectors' Examination Board announce an examination for certificates of qualification for appointment of sanitary inspector or inspector of nuisances under section 108 (d) of the Public Health (London) Act, 1891, will be held in London, on Tuesday, January 18, 1910, and the four following days. In the event of a sufficient number of candidates making application, at least a month previously, examinations may also be held at the following centres:—Birmingham, in June, 1910; Bristol and Cardiff, as arranged in 1910; Liverpool, in April, 1910. The conditions upon which candidates are admitted to the examination, and all necessary particulars will be forwarded on application to the Hon. Secretary, The Sanitary Inspectors' Examination Board, 1 Adelaide Buildings, London Bridge, E.C.

The Council of the Institute of Sanitary Engineers have for a long time felt that it would be very desirable if a summer conference could be arranged at some convenient centre and time, suitable to the majority of the members in different parts of the country. Some of the summer meetings already held have been very successful, but others, owing to small attendance, have been far from satisfactory, the difficulty being apparently to fix upon a suitable town in which to hold the meetings. London has not yet been tried and the Council have decided to canvass the members in order to ascertain, if possible, how many would be willing to attend a conference in London about June 10 to 13, 1910 (inclusive). The Institute have arranged a course of twenty-one lectures in practical sanitary science and engineering, for which the fee is 17*s.* 6*d.* A syllabus may be obtained from Mr. N. W. Hoskins, hon. secretary, 120 and 122 Victoria Street, Westminster, S.W.

In the course of repairs to the wall between the Norbury chantry and chancel of Stoke D'Abernon church, under the supervision of Mr. Philip Johnston, architect, some discoveries have been made. In the space between the pre-Conquest chancel roofing and the vaulted stone ceiling of the thirteenth century lay the larger half of a Norman piscina, which probably was in use previous to 1210, when the remodelling of the chancel was commenced. On the face of the Saxon wall between the ceiling and the roof were found traces of Saxon painting. Beneath is an inscription, of which as yet only a few letters have been deciphered. The fact has been disclosed that originally the two Saxon walls of the chancel converged, and probably terminated in an apse. The stripping of the north wall of the chancel, which is built at an angle to the nave, has revealed the Saxon wall within. The latter does not follow the line of the north wall, but traverses it at an opposite angle, and converges towards the south chancel wall. The fireplace in the north wall of the chantry, now blocked up, is to be opened. It is, according to Mr. Johnston, "probably the only example of mediæval date in a Surrey church, and one of the very few ecclesiastical fireplaces in England." Instructions have also been given to leave exposed to view a small portion of the Saxon wall of the chancel when making good the work of repair, so that its converging character may remain visible.

The Royal Sanitary Institute, 90 Buckingham Palace Road, S.W., have arranged a series of lectures and demonstrations on Sanitary Science as Applied to Buildings and Public Works. The fee for the entire course is 2*l.* 12*s.* 6*d.* The first lecture is on October 8, by Dr. G. F. McLeary, on "Elementary Statistics." It is followed by four on "Science," by Dr. E. J. Steegmann. The other lectures are, "Calculations, Measurements and Plans and Sections," by Mr. W. C. Tyndale, M.Inst.C.E.; a set of three by Mr. H. D. Searles-Wood, F.R.I.B.A., on "Building Materials,"

"Sanitary Building Construction (Advanced)," and "Sanitary Building Construction and Planning; Soil and Local Physical Conditions"; "Sanitary Appliances," by Mr. W. C. Tyndale, M.Inst.C.E.; "Ventilation, Warming, and Lighting," by Col. J. Lane Notter, M.A., M.D.; "Details of Plumbers' Work," by Mr. J. Wright Clarke; "House Drainage," by Mr. W. C. Tyndale, M.Inst.C.E.; "Water: Composition, Pollution, and Purification," by Prof. H. R. Kenwood, M.B., D.P.H. Four lectures by Mr. John Ed. Worth, M.Inst.C.E., district engineer, London County Council, on "Water Supply, Sources of Supply and Distribution," "Sewerage," "Sewage Disposal," and "Scavenging, Disposal of House Refuse."

BUILDING AND BUILDERS.

A NEW bakehouse is to be erected at Macclesfield Workhouse at a cost of 1,804*l.*, inclusive of machinery and offices.

THE Iron and Steel Institute offer a prize to the value of about 30*l.* for the best original paper dealing with any branch of the Mechanics of the Supply or Distribution of Water.

THE Louth Town Council are to apply to the Local Government Board for a loan of 20,540*l.* for carrying out an amended drainage scheme prepared by Mr. Baldwin Latham.

COWDENBEATH Literary Society, Cowdenbeath, N.B., have decided to extend their premises at an estimated cost of 500*l.*, and including furnishing, 800*l.* The available ground to the rear of the present building will be utilised.

THE Southport magistrates have granted a music and dancing licence for a skating rink, to accommodate 3,000 people, which is to be built on a central site leased from the Corporation.

THE Kirkcaldy Dean of Guild Court at their last meeting passed the following plans:—Alterations on shop at 18 Bridge Street; extension and alterations on factory at Links Street for Messrs. Robert Stocks & Co.; alterations on the north factory for Messrs. M. Nairn & Co.; and internal alterations at King's Theatre.

THERE has been quite a revival in the building trade at Willesden during the past few weeks. The District Council have just passed plans for eighty new houses, in addition to which they sanctioned the erection of 100 dwelling houses a month ago.

THE Reading Town Council have agreed to apply, on the Board of Education approving the estimates, to the Local Government Board for sanction to a loan of 10,250*l.* for the alterations to the main block and the erection of class-rooms and offices at Reading school.

AT a special meeting of Fraserburgh Town Council on Monday it was unanimously agreed to proceed at once with the bringing of the new water supply from Federate, New Deer, for the burgh of Fraserburgh, according to plans prepared by Mr. William Allan Carter, C.E., Edinburgh, at an estimated cost of 46,000*l.*

A NEW plan has been submitted to the building committee of the Grindleford Church, Derbyshire, and approved. It is smaller and less costly than the one rejected on account of the expense. It is hoped that the building operations will soon commence. The sum of 1,839*l.* has been collected towards the fund.

AT the last monthly meeting of the Darlington Corporation street committee, thirty plans for new houses in different parts of the town were approved. One set of plans was for twenty houses at Bank Top. It was also stated that the erection of new offices by the North-Eastern Railway Company for their new works on the Stoppendale estate is to be gone on with at once.

THE restoration of St. Mary Magdalene Church, Launceston, is to be continued. The object of the Church Council is to commemorate the four-hundredth year of the rebuilding of the fabric, in which the curious and well-preserved sculptures are a feature. Mr. E. H. Sedding is to carry out the proposals contemplated by the late J. D. Sedding.

THE finance and works committees of the Dundee Harbour trustees recommend to the Board that the reconstruction of the west roundhead at Camperdown jetty should be carried out in ferro-concrete at an estimated cost of 4,600*l.*; and that a new crane barge should be obtained, chiefly for work in the river in mooring and repairing buoys, to cost 5,000*l.*

The meeting also decided to recommend an expenditure of 600*l.* for improvements on the patent slip, and of 1,000*l.* for the improvement of lighting and buoys.

At the last meeting of the Lambeth Borough Council the finance committee reported that under the umpire's award the London County Council would have to pay Lambeth 81,342*l.* as purchase money and compensation in connection with the acquisition of Lambeth's wharves and premises in Belvedere Road, as a site for the new county hall. As the sum awarded by the umpire exceeded that offered by the County Council that body will have to pay the costs of the arbitration. A small committee will consider how the money should be dealt with.

The Manchester City Council last week considered the sanitary committee's application for borrowing powers for housing purposes. The sanitary committee started a scheme some five years ago for building houses on what is known as the Temple Estate, Cheetham Hill. Land was bought and plans for the erection of cottages were prepared. The committee's proposals, however, did not at first find favour with the Council. New plans were prepared, and these the Council were last week invited to pass and let the committee take the usual steps for borrowing 16,615*l.* to cover the cost of the 82 cottages and putting streets in order. On the recommendation of the finance committee it was decided by the Council that representations be made to the Local Government Board that the obligation to provide the houses referred to might be waived in view of the number of houses now empty and suitable for the housing of the class of persons to be displaced.

The Newcastle Town Council have leased to Mr. G. W. Parkinson 4,770 square yards of land abutting on Northumberland Road, and bounded on the east side by the riding school, and on the west side by Ginnett's circus. It belongs to the Magdalene Hospital estate, and the rent to be charged is 500*l.* per annum. It is proposed to erect on the site a "White City." At the same meeting last week a report from the estate and property committee was adopted, recommending that 11¾ acres of land be leased to Messrs. Sir W. G. Armstrong, Whitworth & Co., Ltd., at Walker. This, with leases already sanctioned, makes a total of 33¾ acres at a rental of 886*l.* per annum. It is understood that the Elswick firm intend to make alterations so that there will be space to build a Dreadnought and to accommodate the largest vessels afloat, as well as for carrying out other important Admiralty work.

The Glasgow Corporation at their meeting on the 5th inst. considered a letter from the Glasgow and West of Scotland Building Trades Employers' Council regarding the bylaws under the Building Regulations Act, 1909. The letter stated that they understood that the draft bylaws were to be put before the Council that day. Owing to the holidays intervening, the members of the Building Trades Employers' Council had had no opportunity of examining the bylaws. The Council would be extremely obliged to the Corporation if they would delay further consideration of the bylaws until, say, a month from that date, and by that time the members would have gone over them. On the proposal of the Lord Provost it was agreed to delay consideration of the bylaws for five weeks. At the same meeting the parks committee recommended that bandstands be erected in Rouken Glen and Bellahouston Park, and two additional drinking fountains in the latter park, and also that the offer by Messrs. A. & J. Main & Co., Ltd., for the erection of the new gates at the Victoria Road entrance to the Queen's Park for 500*l.* be accepted, on condition that the quality of the stone for the pillars and certain minor alterations on the design will be to the satisfaction of the city engineer, and that a modification will be made as to the style of the lamps on the pillars, to meet the requirements of the lighting department.

Exmouth Urban District Council have received a report from Messrs. G. H. Hill & Sons, on the result of the boring at Dolton Lane. The engineers mentioned that the boring had reached a depth of 338 feet below the surface, the last 34 feet being in the pebble beds. The official test showed a yield of 960,000 gallons per day, so that as the estimated additional requirements of Exmouth alone in the year 1931 were estimated at nearly 300,000 gallons a day the supply furnished by the boring was adequate. The final cost of boring was 1,605*l.* 14*s.* 8*d.* The parliamentary estimate of the scheme prepared last year amounted to 43,000*l.*, of which, however, 5,000*l.* was provided to cover future exten-

Digitized by Google

sion of piping, &c., in the district. The amount attributable to the new source of supply was therefore 38,000*l*. It had now been estimated that the boring alone would supply all the water required, and that 8,700*l*. for the well and adits provided for in the parliamentary estimate would not be required. The 38,000*l*. was thus reduced to 30,906*l*. Again the level of the water in the borehole when three times the supply was being taken was only about 45 feet from the surface. This fact allowed economical use of a much less costly type of pumping machinery, which was estimated now at 3,252*l*. A reduction would also be shown in the estimated cost of the trunk mains. The 38,000*l*. was therefore still further reduced to 28,033*l*.

TRADE NOTES.

A LARGE chiming clock has been erected in the parish church, Rangemore, Burton-on-Trent, as a memorial to the late Lord Burton. It was formally started by Lady Burton. It shows time on four large dials and is fitted with all the latest improvements, being made generally to the designs of the late Lord Grimthorpe, by John Smith & Sons, Midland Clock Works, Derby, who made the Burton town hall clock for the late Lord Burton many years ago.

A NEW clock and chimes were dedicated on August 2 by the Rev. the Dean of Carlisle, at Bampton Church, Westmorland, as a memorial to the Dalton family, and made and fixed by Messrs. Potts & Sons, Ltd., clock manufacturers, of Leeds and Newcastle-on-Tyne, who are making a large illuminated clock for Lincolnshire, and large clock and chimes for Middlesbrough, Yorks, and for the ancient collegiate church of St. Cuthbert, Darlington, from the late Lord Grimthorpe's plans.

A COMPANY has been registered as the Clean Air Ventilator Co., Ltd., with a capital of 5,000*l*. in 1*l*. shares. The offices are at 115 Liverpool Road, Manchester.

A NEW Wesleyan church, at a cost of 4,000*l*., is to be erected at Cromer. The foundation stone was laid on Wednesday.

THE GATEHOUSE, WETHERAL PRIORY.

THE Gatehouse—all that now remains of Wetheral Priory—appears to have been constructed by Abbot THORNTON very shortly before the suppression of the monasteries by HENRY VIII. It has a round semi-circular-headed arch, surmounted by a square label in the same wall. The Gatehouse is situated the same as at

THE GATEHOUSE · WETHERAL · PRIORY

Carlisle, to the south-west of the church. The priory was founded by RANULPH DE MESCHINES, Earl of Cumberland, in the reign of WILLIAM II. It was erected as a cell to the abbey of St. Mary at York, and dedicated to St. CONSTANTINE. In 1546 A.D. HENRY VIII. gave it to the Dean and Chapter of Carlisle, in whose possession it still remains. Our illustration is from a sketch by Mr. H. SCOTT-SAWYER.

TRANSATLANTIC PASSENGER AND MAIL TRAFFIC.

Various references have recently appeared in the public Press as to the relative advantages of different ports for the call of the larger and faster Transatlantic steamers, and there seems to be little doubt that the facilities afforded by the harbour at Fishguard show a material saving when compared with other ports, as will be seen from the following table:—

New York	to	Fishguard	direct	2,902	miles.
,,	,,	,, Holyhead	,,	2,943	,,
,,	,,	,, Plymouth	,,	2,957	,,
,,	,,	,, Liverpool	,,	3,015	,,
,,	,,	,, Southampton	,,	3,076	,,

Compared with Liverpool, therefore, the saving in distance to Fishguard is 113 miles, and owing to the slackening of speed necessary on the Mersey the time occupied in sailing this distance is material.

It is recognised that the steamship companies have to cater for the continental as well as the English traffic, and there is no doubt that Plymouth is the best available port of call for liners making their home at Southampton. For vessels making their home at Liverpool, however, there can be no question that the most convenient and serviceable port of call is Fishguard.

As at Plymouth, the most complete arrangements exist at Fishguard for dealing with vessels of the largest capacity, and the experience of the Booth Line, which regularly makes use of the port, is that the facilities are quite up-to-date. Commodious tenders meet the vessels which anchor inside the breakwater, where there is ample depth of water for the largest ships, and the conveniences at the station are of the most modern description. The quay space is over half a mile in length, and an additional station has recently been opened on the breakwater itself, equipped with the necessary waiting rooms, customs depot, and telegraph office. The depth of water alongside this ocean quay station is 40 feet.

The distance by rail from Fishguard to London is 261 miles, and the time occupied on this journey by an ocean special, with a stop at Cardiff to set down passengers for South Wales and the Midlands, is no more than 4¾ hours.

Then again, the splendid service which is given twice a day by the turbine steamers between Fishguard and Rosslare is available for passengers and mails for Ireland if landed at Fishguard.

The commercial prosperity of the country is so much dependent upon the facilities afforded for the landing of mails and the quick transit of passengers, that, having regard to the information given above, it is not surprising that the attention of the principal steamship companies is at the present time being focussed on Fishguard as a port of call.

LONDON MASTER BUILDERS' ASSOCIATION.

The following meetings have been held since the June report:—Special Council, July 8; Organisation Committee, July 29; Ordinary Council, July 29.

The Special Council Meeting was held for the purpose of considering matters relating to the Land Taxation Clauses in the Finance Bill before Parliament, and, after approving the Emergency Committee's report, the subject was widely discussed and the following gentlemen were elected to represent this Association at the forthcoming conference:—Mr. F. G. Rice (President), Col. G. Haward Trollope, Mr. Joseph Randall, and Mr. H. W. Horner.

The Organisation Committee's report was submitted orally by the chairman (Mr. F. Higgs) and instructions were given to send out a statement of the recommendations with the notices convening the Council Meeting.

The Ordinary Council Meeting received and approved the Committee's reports and endorsed the views expressed by its representatives at the late Portsmouth half-yearly meeting of the National Federation that, taking into consideration the satisfactory results of the operation of the agreement between this Association and the Operative Plasterers of London, the new N.A.O.P. General Rules should not supersede the Working Rule Agreement already existing between these two bodies.

The Council then elected Mr. E. A. Hough a member of the L.M.B.A., and gave instructions to the solicitor to investigate and report upon the particulars of the case in which an appeal was made against the decision of an arbitrator.

From a feeling of international courtesy, and because of the warmth of hospitality extended to British builders by them last year, the Council gladly decided to invite the party of Belgian master builders, who are now visiting London, to dinner at St. Ermin's Hotel, Victoria Street, Westminster, on Thursday, August 12, of which the members of the Association were duly advised.

Among the correspondence was a letter from the President of the R.I.B.A. to Mr. J. Carmichael, congratulating him upon the evidence he gave in connection with the L.C.C. (General Powers) Bill 1909. The Council had much pleasure on learning the fact, and added its high approval and appreciation of Mr. Carmichael's action.

ELECTRICAL SMELTING.

The British Consul at Stockholm, in his report for 1908, gives a long note on the electrical smelting of iron ore. He says that the technical practicability of smelting iron ore by electricity was proved some years ago. It is now claimed that a commercially economical method has been discovered in Sweden by which it is hoped that with the aid of the vast water power of the country its enormous mineral deposits of ore, of which the richness and quality has been recognised for centuries, may be smelted without the importation of so much coal or such a consumption of charcoal. If this economical problem has been solved, credit must in the main be given to the three Swedish engineers, Assar Gronwall, Axel Lindblad, and Otto Stalhane, who for the past two and a half years have steadily experimented.

An oven of sufficient size for practical purposes has been erected at Domnarfvet. Into an ordinary oven, without blast, however, ore and charcoal are mixed from above in the usual manner, electric wires are introduced into the bottom of the oven, which should give a temperature of at least 2,000 deg. Cent. in the smelting oven. During the process air must be entirely excluded. The charcoal which is used is simply for reducing the ore, the consumption being calculated to be about one-third of that usually required in a blast-furnace. Electrical power required may be considered to be 1.3 h.p. per ton of pig iron. If the price of electricity be 50kr. (2*l.* 7*s.* 10*d.*) per horse-power, the total cost consequently of producing a ton of pig iron may be reckoned as about 29kr. (1*l.* 12*s.* 3*d.*). The use of electrod is not expected to exceed 1kr. (1*s.* 2*d.*) per ton. The life of an oven is considered longer than that of a blast-furnace. It is, moreover, claimed that the product is of excellent quality. Sulphur is almost entirely eliminated and the iron freed from gas and slag. Good iron can even be produced from excessively sulphurous ores, whereas its phosphorous qualities are not diminished. Instead of charcoal, coke may equally well be used.

The problem has, at any rate, been solved to such an extent as to attract much attention, and Dr. Eugene Haanel, Director of Mines, Ottawa, Canada, who for years past has encouraged experiments on these lines, came to examine the process, and is reported to consider that "if the process is carried out on a sufficiently large scale, the cost of producing iron in this way would justify its use in Canada in some of the districts where energy is supplied at cheap rates." It will, however, still remain a question whether it will pay better to smelt great quantities of iron ore in Sweden and export it as pig iron than to continue exporting ore as hitherto; unless, of course, Sweden can use the pig iron herself. Even if Sweden by this process can produce pig iron much more cheaply than hitherto possible in Sweden, it does not follow that such pig iron would be cheaper than pig iron produced from Swedish ore in other countries. Again, the total horse-power to be developed from Swedish waterfalls is only estimated at 4,000,000 horse-power, and naturally much of this is not situated conveniently for the ore, so that additional transport must be considered. Another problem is, what proportion of the electrical horse-power, in view of other industries, can be profitably expended on producing pig iron? Assuming that the new method of electrical smelting proves successful, no great subversion of trade would be likely to immediately follow, when one remembers the enormous quantity of ore that the country possesses, provided that the mining of it be permitted.

The Westhoughton Urban Council, Lancs., have instructed their surveyor to prepare plans and estimates for the erection of baths. A site has not yet been purchased.

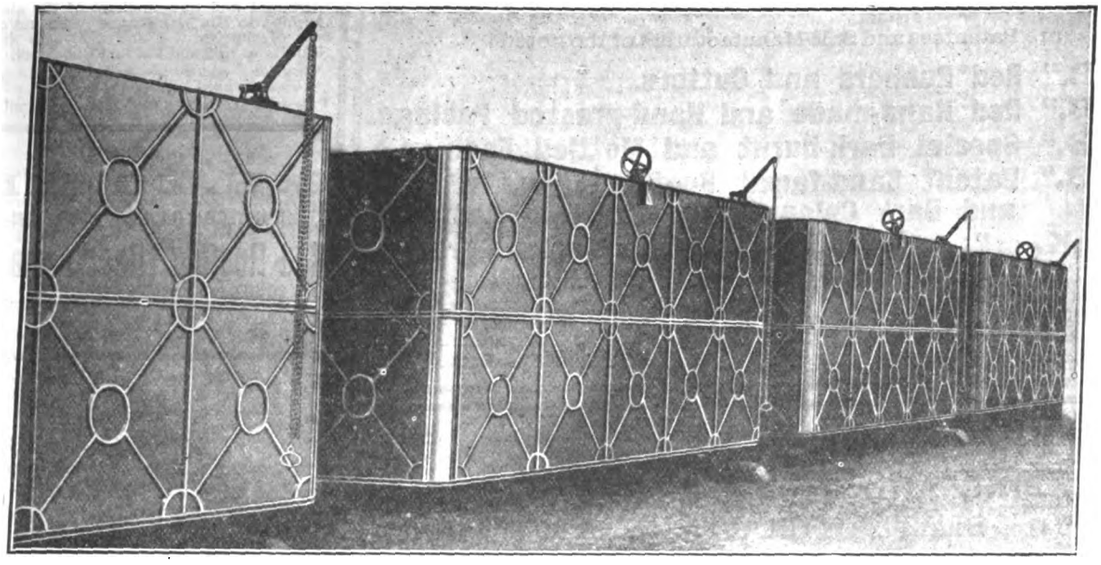
THE STORY OF LONDON.

The last of an interesting series of lectures at the Garden Suburbs Institute, Hampstead, given in connection with the Town-Planning and Housing Exhibition held there, was delivered on August 4, before a crowded audience, by Mr. S. K. Ratcliffe. The lecturer explained that only a hasty sketch was possible in the time at his disposal, and that even in that there must be many big gaps, for the story of London was a continuous history from the time of the Roman occupation. The Roman city which grew up on the site of the British tribal stronghold rapidly became a place of importance as a centre of commerce, admirably situated as it was for the two great streams of trade from the Mediterranean and the Baltic. What happened to London after the Romans left Britain it was exceedingly difficult to say. The most probable conjecture was that the city was not destroyed by the Saxon invaders, but that its citizens made terms, as so often afterwards, with the conquerors.

To King Alfred belonged the credit of rebuilding and resettling the city after its partial destruction by the Danes. He rebuilt the wall, and was evidently the first English monarch to realise the importance of London as the metropolis of England. At the Norman Conquest the city, against the advice of its sheriff, opened its gates to William, who signalised his overlordship by building the Tower and granting London its first charter. Both events had been somewhat misinterpreted by some of the historians of London. The Tower was not intended for the defence of the city, but to overawe the citizens; the charter, instead of granting fresh privileges, merely confirmed the rights and liberties which had been enjoyed by the citizens of London during the Saxon times. It was the first of a long series of charters, and the relations between William the Norman and the citizens were the starting-point of a protracted struggle for liberty between the city and the monarchy, a struggle which issued in the grant to the commune of the gradual consolidation of the power of self-government embodied in the three estates of the City—namely, Lord Mayor, Aldermen and Common Council.

After describing and illustrating, with the aid of lantern slides, some aspects of Mediæval London and sketching briefly the life of the citizen, the lecturer went on to speak of the development of the merchant-citizens in the sixteenth and seventeenth centuries and the principal characteristics of the Elizabethan city. It was during the Elizabethan epoch that the civic authorities found themselves confronted with the problem of expansion, the spread of the city beyond its ancient boundaries, and attempted to deal with it by means of proclamations and Acts of Parliament, forbidding the building of houses within a certain distance of the walls. Expansion being inevitable, such a policy was necessarily futile; but it was interesting to speculate as to the probable development of London had the problem been correctly understood 300 years ago.

The Mediæval city disappeared with the Great Fire. London had an architect of genius in Sir Christopher Wren, who, if he had been permitted to carry out his scheme of city design, would have made a noble beginning for the modern city. But the opportunity was not given to him, so that Wren was compelled to devote to the building of churches the scientifico-artistic genius which should have been employed in the remaking of the streets. What happened in the City itself after the fire was typical of what had been happening all along outside the boundaries. Greater London had grown up without control or direction, and one consequence of this undirected expansion was that the metropolitan area had never been a unity. Only in the City proper was there a tradition of civic government and civic sentiment; the parishes and villages which had become absorbed into the ever-growing metropolis had had to wait until our own day for the machinery of administration. Hence it was not possible that the dwellers in Greater London should ever share in the feeling of civic pride which was characteristic of the ancient city. Their task was to create new cities out of the boroughs and urban areas which to-day made up the province or region of modern London.



The excellent slides shown by the lecturer illustrated some of the more important ancient buildings and streets, the spread of the city westward, old Charing Cross and Whitehall, the planning of West Central London in the eighteenth century, rural Hampstead and its neighbourhood, and the seamy side of the expanding metropolis, as shown by such satirists as Hogarth and Rowlandson.

THE WELL-KNOWN FRIEZE
ENTITLED
"THE CORN FIELD."
1. Ploughing. 2. Harrowing. | 3. Mowing. 4. Carting. | 5. The Products of the Corn Field.
A Splendid Example of COLOUR-WORK in Permanent Ink Photo. by M. PAUL AUBERT BAUDOIN.
Length, Fourteen Feet Seven Inches by Fifteen Inches deep.
This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.
In consequence of the almost daily demand for these plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing Free by Post, carefully Packed inside Patent Roller.

... THE ...

H. & C. Wrought Steel "Louvre" Ventilators

Black Japanned,
White Japanned,
Nickel Plated,
Bronze Plated.
ALSO IN
Solid Wrought Brass and Bronze Metal.

ELEGANCE. LOW PRICE. NO BREAKAGE.
SPECIFIED BY ARCHITECTS.

MADE IN 130 SIZES.
From 4 by 6 to 24 by 42.

Each Ventilator is packed in a separate cardboard box, and is furnished with one brass pulley (no cord or tassels).

These Ventilators being made entirely of **Wrought Steel,** breakage either in transportation, in stock or in use, is practically impossible.

They are light in weight, with a consequent **Saving in Carriage.**

The Operating Slide is made of very heavy gauge steel, and is especially **strong** to insure against breakage and guaranteeing a **free** and positive operation.

Each Ventilator is packed in a separate cardboard box, and is furnished with one brass Pulley (no cord or tassels).

Sold by all First-class Builders' Merchants.
